```

[Continuation.intercepted] can be used to acquire the intercepted continuation.

- * Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in the invocation context established by [ContinuationInterceptor].
- * Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

```

@SinceKotlin("1.3")
public actual fun <T> (suspend () -> T).createCoroutineUnintercepted(
    completion: Continuation<T>): Continuation<Unit> =
    // Kotlin/JS suspend lambdas have an extra parameter
    `suspended`
    if (this.asDynamic().length == 2) {
        // When `suspended` is true the continuation is created,
        but not executed
        this.asDynamic()(completion, true)
    } else {
        createCoroutineFromSuspendFunction(completion) {
            this.asDynamic()(completion)
        }
    }

```

- * Creates unintercepted coroutine with receiver type [R] and result type [T].
- * This function creates a new, fresh instance of suspendable computation every time it is invoked.
- * To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance.
- * The [completion] continuation is invoked when coroutine completes with result or exception.
- * This function returns unintercepted continuation.

Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext].

- * It is the invoker's responsibility to ensure that a proper invocation context is established.
- * Note that [completion] of this function may get invoked in an arbitrary context.

[Continuation.intercepted] can be used to acquire the intercepted continuation.

- * Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in the invocation context established by [ContinuationInterceptor].
- * Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

```

@SinceKotlin("1.3")
public actual fun <R, T> (suspend R.() -> T).createCoroutineUnintercepted(
    receiver: R, completion: Continuation<T>):
    Continuation<Unit> =
    // Kotlin/JS suspend lambdas have an extra parameter `suspended`
    if (this.asDynamic().length == 3) {
        // When `suspended` is true the continuation is created, but not executed
        this.asDynamic()(receiver, completion, true)
    } else {
        createCoroutineFromSuspendFunction(completion) {
            this.asDynamic()(receiver, completion)
        }
    }

```

- * Intercepts this continuation with [ContinuationInterceptor].
- * This function shall be used on the immediate result of [createCoroutineUnintercepted] or [suspendCoroutineUninterceptedOrReturn], in which case it checks for [ContinuationInterceptor] in the continuation's [context][Continuation.context], invokes [ContinuationInterceptor.interceptContinuation], caches and returns the result.
- * If this function is invoked on other [Continuation] instances it returns `this` continuation unchanged.

```

extension function with body using dynamic")\npublic annotation class nativeGetter\n\n@Target(FUNCTION)\n@Deprecated("Use inline extension function with body using dynamic")\npublic annotation class nativeSetter\n\n@Target(FUNCTION)\n@Deprecated("Use inline extension function with body using dynamic")\npublic annotation class nativeInvoke\n\n@Target(CLASS, FUNCTION, PROPERTY)\n\ninternal annotation class library(public val name: String = "")\n\n@Target(CLASS)\n\ninternal annotation class marker\n\n/**\n * Gives a declaration (a function, a property or a class) specific name in JavaScript.\n * This may be useful in the following cases:\n * * There are two functions for which the compiler gives same name in JavaScript, you can mark one with `@JsName(...)` to prevent the compiler from reporting error.\n * * You are writing a JavaScript library in Kotlin. The compiler produces mangled names for functions with parameters, which is unnatural for usual JavaScript developer. You can put `@JsName(...)` on functions you want to be available from JavaScript.\n * * For some reason you want to rename declaration, e.g. there's common term in JavaScript for a concept provided by the declaration, which is uncommon in Kotlin.\n * Example:\n * ``` kotlin\n * class Person(val name: String) {\n * fun hello() {\n * println("Hello \$name!")\n * }\n * @JsName("helloWithGreeting")\n * fun hello(greeting: String) {\n * println("\$greeting \$name!")\n * }\n * }\n * ```\n * @property name the name which compiler uses both for declaration itself and for all references to the declaration. It's required to denote a valid JavaScript identifier.\n * \n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, FUNCTION, PROPERTY, CONSTRUCTOR, PROPERTY_GETTER, PROPERTY_SETTER)\n\npublic actual annotation class JsName(actual val name: String)\n\n/**\n * Denotes an `external` declaration that must be imported from native JavaScript library.\n * The compiler produces the code relevant for the target module system, for example, in case of CommonJS, it will import the declaration via the `require(...)` function. The annotation can be used on top-level external declarations (classes, properties, functions) and files. In case of file (which can't be `external`) the following rule applies: all the declarations in the file must be `external`. By applying `@JsModule(...)` on a file you tell the compiler to import a JavaScript object that contain all the declarations from the file.\n * Example:\n * ``` kotlin\n * @JsModule("jquery")\n * external abstract class JQuery() {\n * // some declarations here\n * }\n * @JsModule("jquery")\n * external fun JQuery(element: Element): JQuery\n * ```\n * @property import name of a module to import declaration from. It is not interpreted by the Kotlin compiler, it's passed as is directly to the target module system.\n * @see JsNonModule\n * \n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, PROPERTY, FUNCTION, FILE)\n\npublic annotation class JsModule(val import: String)\n\n/**\n * Denotes an `external` declaration that can be used without module system. By default, an `external` declaration is available regardless your target module system. However, by applying [JsModule] annotation you can make a declaration unavailable to *plain* module system. Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module available as an npm package. To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation. For example:\n * ``` kotlin\n * @JsModule("jquery")\n * @JsNonModule\n * @JsName("\$")\n * external abstract class JQuery() {\n * // some declarations here\n * }\n * @JsModule("jquery")\n * @JsNonModule\n * @JsName("\$")\n * external fun JQuery(element: Element): JQuery\n * ```\n * @see JsModule\n * \n\n@Retention(AnnotationRetention.BINARY)\n@Target(CLASS, PROPERTY, FUNCTION, FILE)\n\npublic annotation class JsNonModule\n\n/**\n * Adds prefix to `external` declarations in a source file. JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects. The compiler turns references to `external` declarations either to plain unprefix names (in case of *plain* modules) or to plain imports. However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this. You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)` annotation. Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations. Example:\n * ```\n * @file:JsQualifier("my.jsPackageName")\n * package some.kotlinPackage\n * external fun foo(x: Int)\n * external fun bar(): String\n * ```\n * @property value the qualifier to add to the declarations in the generated code. It must be a sequence of valid JavaScript identifiers separated by the `.` character.

kotlin.experimental.ExperimentalTypeInference\n\n/*\n * Allows to infer generic type arguments of a function
from the calls in the annotated function parameter of that function.\n * \n * When this annotation is placed on a
generic function parameter of a function,\n * it enables to infer the type arguments of that generic function from the
lambda body passed to that parameter.\n * \n * The calls that affect inference are either members of the receiver type
of an annotated function parameter or\n * extensions for that type. The extensions must be themselves annotated
with `@BuilderInference`.\n * \n * Example: we declare\n * ```\n * fun <T> sequence(@BuilderInference block:
suspend SequenceScope<T>().() -> Unit): Sequence<T>\n * ```\n * and use it like\n * ```\n * val result = sequence {
yield("result") }\n * ```\n * Here the type argument of the resulting sequence is inferred to `String` from\n * the
argument of the [SequenceScope.yield] function, that is called inside the lambda passed to [sequence].\n * \n * Note:
this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.\n
*\n * \n * @Target(VALUE_PARAMETER, FUNCTION,
PROPERTY)\n@Retention(AnnotationRetention.BINARY)\n@SinceKotlin("1.3")\n@ExperimentalTypeInferenc
e\npublic annotation class BuilderInference\n\n/*\n * Enables overload selection based on the type of the value
returned from lambda argument.\n * \n * When two or more function overloads have otherwise the same parameter
lists that differ only in the return type\n * of a functional parameter, this annotation enables overload selection by the
type of the value returned from\n * the lambda function passed to this functional parameter.\n * \n * Example:\n *
```
\n * @OverloadResolutionByLambdaReturnType\n * fun create(intProducer: () -> Int): Int\n * \n * fun
create(doubleProducer: () -> Double): Double\n * \n * val newValue = create { 3.14 }\n * ```\n * \n * The annotation
being applied to one of overloads allows to resolve this ambiguity by analyzing what value is returned\n * from the
lambda function.\n * \n * This annotation is also used to discriminate the annotated overloads in case if overload
selection still cannot\n * choose one of them even taking in account the result of lambda parameter analysis. In that
case a warning is reported.\n * \n * Note: this annotation is experimental, see [ExperimentalTypeInference] on how
to opt-in for it.\n

n/**
 * Obtains the current continuation instance inside suspend functions and either
 * suspends
 * currently running coroutine or returns result immediately without suspension.
 *
 * If the [block] returns the special [COROUTINE_SUSPENDED] value, it means that suspend function did suspend the execution and will
 * not return any result immediately. In this case, the [Continuation] provided to the [block] shall be
 * resumed by invoking [Continuation.resumeWith] at some moment in the
 * future when the result becomes available to resume the computation.
 *
 * Otherwise, the return value of the [block] must have a type assignable to [T] and represents the result of this suspend function.
 * It means that the execution was not suspended and the [Continuation] provided to the [block] shall not be invoked.
 *
 * As the result type of the [block] is declared as `Any?` and cannot be correctly type-checked,
 * its proper return type remains on the conscience of the suspend function's author.
 *
 * Invocation of [Continuation.resumeWith] resumes coroutine directly in the invoker's thread without going through the
 * [ContinuationInterceptor] that might be present in the coroutine's [CoroutineContext].
 * It is the invoker's responsibility to ensure that a proper invocation context is established.
 *
 * [Continuation.intercepted] can be used to acquire the intercepted continuation.
 *
 * Note that it is not recommended to call either [Continuation.resume] nor [Continuation.resumeWithException] functions synchronously
 * in the same stackframe where suspension function is run. Use [suspendCoroutine] as a safer way to obtain current
 * continuation instance.

package kotlin
import kotlin.coroutines.*
import kotlin.coroutines.intrinsics.*
import kotlin.native.concurrent.SharedImmutable
"/
* Defines deep recursive function that keeps its stack on the heap,
* which allows very deep recursive computations that do not use the actual call stack.
* To initiate a call to this deep recursive function use its [invoke] function.
* As a rule of thumb, it should be used if recursion goes deeper than a thousand calls.
* The [DeepRecursiveFunction] takes one parameter of type [T] and returns a result of type [R].
* The [block] of code defines the body of a recursive function. In this block
* [callRecursive][DeepRecursiveScope.callRecursive] function can be used to make a recursive call
* to the declared function. Other instances of [DeepRecursiveFunction] can be called
* in this scope with `callRecursive` extension, too.
* For example, take a look at the following recursive tree class and a deeply
* recursive instance of this tree with 100K nodes:
*/
class Tree(val left: Tree? = null, val right: Tree? = null)
val deepTree = generateSequence(Tree()) { Tree(it) }.take(100_000).last()
"/
* A regular recursive function can be defined to compute a depth of a tree:
*/
fun depth(t: Tree?): Int =
 if (t == null) 0 else
 max(depth(t.left), depth(t.right)) + 1
println(depth(deepTree)) // StackOverflowError
"/
* If this `depth` function is called for a `deepTree` it produces [StackOverflowError] because of deep recursion.
*/

```

However, the `depth` function can be rewritten using `DeepRecursiveFunction` in the following way, and then it successfully computes `[depth(deepTree)][DeepRecursiveFunction.invoke]` expression:

```

val depth =
 DeepRecursiveFunction<Tree?, Int> { t -> if (t == null) 0 else max(callRecursive(t.left),
 callRecursive(t.right)) + 1 }
println(depth(deepTree)) // Ok

```

Deep recursive functions can also mutually call each other using a heap for the stack via `[callRecursive][DeepRecursiveScope.callRecursive]` extension. For example, the following pair of mutually recursive functions computes the number of tree nodes at even depth in the tree.

```

val mutualRecursion = object {
 val even: DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t -> if (t == null) 0 else
 odd.callRecursive(t.left) + odd.callRecursive(t.right) + 1 }
 val odd: DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t -> if (t == null) 0 else even.callRecursive(t.left) +
 even.callRecursive(t.right) }
}

```

`@param [T] the function parameter type.`  
`@param [R] the function result type.`  
`@param block the function body.`

```

@SinceKotlin("1.4")@ExperimentalStdlibApi
public class DeepRecursiveFunction<T, R> {
 internal val block: suspend DeepRecursiveScope<T, R>.(T) -> R
}

```

Initiates a call to this deep recursive function, forming a root of the call tree. This operator should not be used from inside of `[DeepRecursiveScope]` as it uses the call stack slot for initial recursive invocation. From inside of `[DeepRecursiveScope]` use `[callRecursive][DeepRecursiveScope.callRecursive]`.

```

@SinceKotlin("1.4")@ExperimentalStdlibApi
public operator fun <T, R> DeepRecursiveFunction<T, R>.invoke(value: T): R =
 DeepRecursiveScopeImpl<T, R>(block, value).runCallLoop()

```

A scope class for `[DeepRecursiveFunction]` function declaration that defines `[callRecursive]` methods to recursively call this function or another `[DeepRecursiveFunction]` putting the call activation frame on the heap.

```

@RestrictsSuspension@SinceKotlin("1.4")@ExperimentalStdlibApi
public sealed class DeepRecursiveScope<T, R> {
 /** Makes recursive call to this [DeepRecursiveFunction] function putting the call activation frame on the heap, as opposed to the actual call stack that is used by a regular recursive call. */
 public abstract suspend fun callRecursive(value: T): R
 /** Makes call to the specified [DeepRecursiveFunction] function putting the call activation frame on the heap, as opposed to the actual call stack that is used by a regular call. */
 public abstract suspend fun <U, S> DeepRecursiveFunction<U, S>.callRecursive(value: U): S
}

```

`@Deprecated(level = DeprecationLevel.ERROR, message = "'invoke' should not be called from DeepRecursiveScope. Use 'callRecursive' to do recursion in the heap instead of the call stack.")`  
`replaceWith = ReplaceWith("this.callRecursive(value)")`

```

@Suppress("UNUSED_PARAMETER")
public operator fun DeepRecursiveFunction<*, *>.invoke(value: Any?): Nothing =
 throw UnsupportedOperationException("Should not be called from DeepRecursiveScope()")

```

 Special cases:\n \*  $-\text{log}(x, b)$  is  $\text{NaN}$  if either  $x$  or  $b$  are  $\text{NaN}$   $\backslash$ n \*  $-\text{log}(x, b)$  is  $\text{NaN}$  when  $x < 0$  or  $b \leq 0$  or  $b == 1.0$   $\backslash$ n \*  $-\text{log}(+\text{Inf}, +\text{Inf})$  is  $\text{NaN}$   $\backslash$ n \*  $-\text{log}(+\text{Inf}, b)$  is  $+\text{Inf}$  for  $b > 1$  and  $-\text{Inf}$  for  $b < 1$   $\backslash$ n \*  $-\text{log}(0.0, b)$  is  $-\text{Inf}$  for  $b > 1$  and  $+\text{Inf}$  for  $b > 1$

$\backslash$ n \* See also logarithm functions for common fixed bases: [ln], [log10] and [log2].

$\backslash$ n @SinceKotlin("1.2")\npublic expect fun log(x: Float, base: Float): Float\n\n/\*\*\n \* Computes the natural logarithm (base `E`) of the value [x].  
 Special cases:\n \*  $-\text{ln}(\text{NaN})$  is  $\text{NaN}$   $\backslash$ n \*  $-\text{ln}(x)$  is  $\text{NaN}$  when  $x < 0.0$   $\backslash$ n \*  $-\text{ln}(+\text{Inf})$  is  $+\text{Inf}$   $\backslash$ n \*  $-\text{ln}(0.0)$  is  $-\text{Inf}$

$\backslash$ n @SinceKotlin("1.2")\npublic expect fun ln(x: Float): Float\n\n/\*\*\n \* Computes the common logarithm (base 10) of the value [x].  
 @see [ln] function for special cases.

$\backslash$ n @SinceKotlin("1.2")\npublic expect fun log10(x: Float): Float\n\n/\*\*\n \* Computes the binary logarithm (base 2) of the value [x].  
 @see [ln] function for special cases.

$\backslash$ n @SinceKotlin("1.2")\npublic expect fun log2(x: Float): Float\n\n/\*\*\n \* Computes  $\text{ln}(a + 1)$ .  
 This function can be implemented to produce more precise result for [x] near zero.  
 Special cases:\n \*  $-\text{ln1p}(\text{NaN})$  is  $\text{NaN}$   $\backslash$ n \*  $-\text{ln1p}(x)$  is  $\text{NaN}$  where  $x < -1.0$   $\backslash$ n \*  $-\text{ln1p}(-1.0)$  is  $-\text{Inf}$   $\backslash$ n \*  $-\text{ln1p}(+\text{Inf})$  is  $+\text{Inf}$

$\backslash$ n \* @see [ln] function

$\backslash$ n @SinceKotlin("1.2")\npublic expect fun ln1p(x: Float): Float\n\n/\*\*\n \* Rounds the given value [x] to an integer towards positive infinity.  
 @return the smallest Float value that is greater than or equal to the given value [x] and is a mathematical integer.  
 Special cases:\n \*  $-\text{ceil}(x)$  is  $x$  where  $x$  is  $\text{NaN}$  or  $+\text{Inf}$  or  $-\text{Inf}$  or already a mathematical integer.

$\backslash$ n @SinceKotlin("1.2")\npublic expect fun ceil(x: Float): Float\n\n/\*\*\n \* Rounds the given value [x] to an integer towards negative infinity.  
 @return the largest Float value that is smaller than or equal to the given value [x] and is a mathematical integer.  
 Special cases:\n \* -

`floor(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.  
`@SinceKotlin("1.2")` public expect fun `floor(x: Float): Float`: Rounds the given value `[x]` to an integer towards zero.  
`@return` the value `[x]` having its fractional part truncated.  
`Special cases:` `truncate(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.  
`@SinceKotlin("1.2")` public expect fun `truncate(x: Float): Float`: Rounds the given value `[x]` towards the closest integer with ties rounded towards even integer.  
`Special cases:` `round(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.  
`@SinceKotlin("1.2")` public expect fun `round(x: Float): Float`: Returns the absolute value of the given value `[x]`.  
`Special cases:` `abs(NaN)` is `NaN`.  
`@see` `absoluteValue` extension property for `[Float]`.  
`@SinceKotlin("1.2")` public expect fun `abs(x: Float): Float`: Returns the sign of the given value `[x]`: `-1.0` if the value is negative, `0` if the value is zero, `1.0` if the value is positive.  
`Special case:` `sign(NaN)` is `NaN`.  
`@SinceKotlin("1.2")` public expect fun `sign(x: Float): Float`: Returns the smaller of two values.  
`Special cases:` If either value is `NaN`, then the result is `NaN`.  
`@SinceKotlin("1.2")` public expect fun `min(a: Float, b: Float): Float`: Returns the greater of two values.  
`Special cases:` If either value is `NaN`, then the result is `NaN`.  
`@SinceKotlin("1.2")` public expect fun `max(a: Float, b: Float): Float`: Raises this value to the power `[x]`.  
`Special cases:` `b.pow(0.0)` is `1.0`, `b.pow(1.0) == b`, `b.pow(NaN)` is `NaN`, `NaN.pow(x)` is `NaN` for `x != 0.0`, `b.pow(Inf)` is `NaN` for `abs(b) == 1.0`, `b.pow(x)` is `NaN` for `b < 0` and `x` is finite and not an integer.  
`@SinceKotlin("1.2")` public expect fun `Float.pow(x: Float): Float`: Raises this value to the integer power `[n]`.  
`See` the other overload of `[pow]` for details.  
`@SinceKotlin("1.2")` public expect fun `Float.pow(n: Int): Float`: Returns the absolute value of this value.  
`Special cases:` `NaN.absoluteValue` is `NaN`.  
`@see` `abs` function.  
`@SinceKotlin("1.2")` public expect val `Float.absoluteValue: Float`: Returns the sign of this value: `-1.0` if the value is negative, `0` if the value is zero, `1.0` if the value is positive.  
`Special case:` `NaN.sign` is `NaN`.  
`@SinceKotlin("1.2")` public expect val `Float.sign: Float`: Returns this value with the sign bit same as of the `[sign]` value.  
`Special cases:` If `[sign]` is `NaN` the sign of the result is undefined.  
`@SinceKotlin("1.2")` public expect fun `Float.withSign(sign: Float): Float`: Returns this value with the sign bit same as of the `[sign]` value.  
`@SinceKotlin("1.2")` public expect fun `Float.withSign(sign: Int): Float`: Rounds this `[Float]` value to the nearest integer and converts the result to `[Int]`.  
`Ties` are rounded towards positive infinity.  
`Special cases:` `x.roundToInt() == Int.MAX_VALUE` when `x > Int.MAX_VALUE`, `x.roundToInt() == Int.MIN_VALUE` when `x < Int.MIN_VALUE`.  
`@throws` `IllegalArgumentException` when this value is `NaN`.  
`@SinceKotlin("1.2")` public expect fun `Float.roundToInt(): Int`: Rounds this `[Float]` value to the nearest integer and converts the result to `[Long]`.  
`Ties` are rounded towards positive infinity.  
`Special cases:` `x.roundToLong() == Long.MAX_VALUE` when `x > Long.MAX_VALUE`, `x.roundToLong() == Long.MIN_VALUE` when `x < Long.MIN_VALUE`.  
`@throws` `IllegalArgumentException` when this value is `NaN`.  
`@SinceKotlin("1.2")` public expect fun `Float.roundToLong(): Long`: `endregion` region  
`==== Integer Math ====`  
`Special cases:` `abs(Int.MIN_VALUE)` is `Int.MIN_VALUE` due to an overflow.  
`@see` `absoluteValue` extension property for `[Int]`.  
`@SinceKotlin("1.2")` public expect fun `abs(n: Int): Int`: Returns the smaller of two values.  
`@SinceKotlin("1.2")` public expect fun `min(a: Int, b: Int): Int`: Returns the greater of two values.  
`@SinceKotlin("1.2")` public expect fun `max(a: Int, b: Int): Int`: Returns the absolute value of this value.  
`Special cases:` `Int.MIN_VALUE.absoluteValue` is `Int.MIN_VALUE` due to an overflow.  
`@see` `abs` function.  
`@SinceKotlin("1.2")` public expect val `Int.absoluteValue: Int`: Returns the sign of this value: `-1` if the value is negative, `0` if the value is zero, `1` if the value is positive.  
`@SinceKotlin("1.2")` public expect val `Int.sign: Int`: Returns the absolute value of the given value `[n]`.  
`Special cases:` `abs(Long.MIN_VALUE)` is `Long.MIN_VALUE` due to an

overflow\n \* \n \* @see absoluteValue extension property for [Long]\n \* ^\n@SinceKotlin("1.2")\npublic expect fun
