comparator using the sequence of functions to calculate a result of comparison.\n * The functions are called
sequentially, receive the given values `a` and `b` and return [Comparable]\n * objects. As soon as the [Comparable]

```

instances returned by a function for `a` and `b` values do not compare as equal, the result of that comparison is returned from the [Comparator].

```

@sample samples.comparisons.Comparisons.compareByWithSelectors
public fun <T> compareBy(vararg selectors: (T) -> Comparable<*>?): Comparator<T> {
    require(selectors.size > 0)
    return Comparator { a, b -> compareValuesByImpl(a, b, selectors) }
}

```

Creates a comparator using the function to transform value to a [Comparable] instance for comparison.

```

@sample samples.comparisons.Comparisons.compareByWithSingleSelector
public inline fun <T> compareBy(crossinline selector: (T) -> Comparable<*>?): Comparator<T> =
    Comparator { a, b -> compareValuesBy(a, b, selector) }

```

Creates a comparator using the [selector] function to transform values being compared and then applying the specified [comparator] to compare transformed values.

```

@sample samples.comparisons.Comparisons.compareByWithComparator
public inline fun <T, K> compareBy(comparator: Comparator<in K>, crossinline selector: (T) -> K): Comparator<T> =
    Comparator { a, b -> compareValuesBy(a, b, comparator, selector) }

```

Creates a descending comparator using the function to transform value to a [Comparable] instance for comparison.

```

@sample samples.comparisons.Comparisons.compareByDescendingWithSingleSelector
public inline fun <T> compareByDescending(crossinline selector: (T) -> Comparable<*>?): Comparator<T> =
    Comparator { a, b -> compareValuesBy(b, a, selector) }

```

Creates a descending comparator using the [selector] function to transform values being compared and then applying the specified [comparator] to compare transformed values. Note that an order of [comparator] is reversed by this wrapper.

```

@sample samples.comparisons.Comparisons.compareByDescendingWithComparator
public inline fun <T, K> compareByDescending(comparator: Comparator<in K>, crossinline selector: (T) -> K): Comparator<T> =
    Comparator { a, b -> compareValuesBy(b, a, comparator, selector) }

```

Creates a comparator comparing values after the primary comparator defined them equal. It uses the function to transform value to a [Comparable] instance for comparison.

```

@sample samples.comparisons.Comparisons.thenBy
public inline fun <T> Comparator<T>.thenBy(crossinline selector: (T) -> Comparable<*>?): Comparator<T> =
    Comparator { a, b -> {
        val previousCompare = this@thenBy.compare(a, b)
        if (previousCompare != 0) previousCompare else compareValuesBy(a, b, selector)
    } }

```

Creates a comparator comparing values after the primary comparator defined them equal. It uses the [selector] function to transform values and then compares them with the given [comparator].

```

@sample samples.comparisons.Comparisons.thenByWithComparator
public inline fun <T, K> Comparator<T>.thenBy(comparator: Comparator<in K>, crossinline selector: (T) -> K): Comparator<T> =

contains no elements, the function returns `true` because there are no elements in it that `_do not_` match the predicate. See a more detailed explanation of this logic concept in ["Vacuous truth"](https://en.wikipedia.org/wiki/Vacuous\_truth) article.

`@sample`

```
samples.collections.Collections.Aggregates.all
public inline fun <T> Iterable<T>.all(predicate: (T) -> Boolean): Boolean {
    if (this is Collection)
        && isEmpty()
    return true
    for (element in this) if (!predicate(element)) return false
    return true
}
```

Returns `true` if collection has at least one element.

`@sample`

```
samples.collections.Collections.Aggregates.any
public fun <T> Iterable<T>.any(): Boolean {
    if (this is Collection) return !isEmpty()
    return iterator().hasNext()
}
```

Returns `true` if at least one element matches the given [predicate].

`@sample`

```
samples.collections.Collections.Aggregates.anyWithPredicate
public inline fun <T> Iterable<T>.any(predicate: (T) -> Boolean): Boolean {
    if (this is Collection && isEmpty()) return false
    for (element in this) if (predicate(element)) return true
    return false
}
```

Returns the number of elements in this collection.

```
public fun <T> Iterable<T>.count(): Int {
    if (this is Collection) return size
    var count = 0
    for (element in this) checkCountOverflow(++count)
    return count
}
```

Returns the number of elements in this collection.

```
public inline fun <T> Collection<T>.count(): Int {
    return size
}
```

Returns the number of elements matching the given [predicate].

```
public inline fun <T> Iterable<T>.count(predicate: (T) -> Boolean): Int {
    if (this is Collection && isEmpty()) return 0
    var count = 0
    for (element in this) if (predicate(element))
        checkCountOverflow(++count)
    return count
}
```

Accumulates value starting with [initial] value and applying [operation] from left to right to current accumulator value and each element.

Returns the specified [initial] value if the collection is empty.

`@param` [operation] function that takes current accumulator value and an element, and calculates the next accumulator value.

```
public inline fun <T, R> Iterable<T>.fold(initial: R, operation: (acc: R, T) -> R): R {
    var accumulator = initial
    for (element in this) accumulator = operation(accumulator, element)
    return accumulator
}
```

Accumulates value starting with [initial] value and applying [operation] from left to right to current accumulator value and each element with its index in the original collection.

Returns the specified [initial] value if the collection is empty.

`@param` [operation] function that takes the index of an element, current accumulator value and the element itself, and calculates the next accumulator value.

```
public inline fun <T, R> Iterable<T>.foldIndexed(initial: R, operation: (index: Int, acc: R, T) -> R): R {
    var index = 0
    var accumulator = initial
    for (element in this) accumulator = operation(checkIndexOverflow(index++), accumulator, element)
    return accumulator
}
```

Accumulates value starting with [initial] value and applying [operation] from right to left to each element and current accumulator value.

Returns the specified [initial] value if the list is empty.

`@param` [operation] function that takes an element and current accumulator value, and calculates the next accumulator value.

```
public inline fun <T, R> List<T>.foldRight(initial: R, operation: (T, acc: R) -> R): R {
    var accumulator = initial
    if (!isEmpty()) {
        val iterator = listIterator(size)
        while (iterator.hasPrevious()) {
            accumulator = operation(iterator.previous(), accumulator)
        }
    }
    return accumulator
}
```

Accumulates value starting with [initial] value and applying [operation] from right to left to each element with its index in the original list and current accumulator value.

Returns the specified [initial] value if the list is empty.

`@param` [operation] function that takes the index of an element, the element itself and current accumulator value, and calculates the next accumulator value.

```
public inline fun <T, R> List<T>.foldRightIndexed(initial: R, operation: (index: Int, T, acc: R) -> R): R {
    var accumulator = initial
    if (!isEmpty()) {
        val iterator = listIterator(size)
        while (iterator.hasPrevious()) {
            val index = iterator.previousIndex()
            accumulator = operation(index, iterator.previous(), accumulator)
        }
    }
    return accumulator
}
```

Performs the given [action] on each element.

```
public inline fun <T> Iterable<T>.forEach(action: (T) -> Unit): Unit {
    for (element in this) action(element)
}

```

```

destination.addAll(list) } return destination }

Returns a list containing the results of applying the
given [transform] function to each entry in the original map.
@sample
samples.collections.Maps.Transformations.mapToList
public inline fun <K, V, R> Map<out K,
V>.map(transform: (Map.Entry<K, V>) -> R): List<R> {
return mapTo(ArrayList<R>(size),
transform)}
Returns a list containing only the non-null results of applying the given [transform]
function to each entry in the original map.
@sample
samples.collections.Maps.Transformations.mapNotNull
public inline fun <K, V, R : Any> Map<out K,
V>.mapNotNull(transform:
(Map.Entry<K, V>) -> R?): List<R> {
return mapNotNullTo(ArrayList<R>(), transform)}
Applies
the given [transform] function to each entry in the original map and appends only the non-null results to the
given [destination].
public inline fun <K, V, R : Any, C : MutableCollection<in R>> Map<out K,
V>.mapNotNullTo(destination: C, transform: (Map.Entry<K, V>) -> R?): C {
forEach { element ->
transform(element)?.let { destination.add(it) } }
return destination}
Applies the given [transform]
function to each entry of the original map and appends the results to the given [destination].
public inline
fun <K, V, R, C : MutableCollection<in R>> Map<out K, V>.mapTo(destination: C, transform: (Map.Entry<K, V>)
-> R): C {
for (item in this)
destination.add(transform(item))
return destination}
Returns
`true` if all entries match the given [predicate].
Note that if the map contains no entries,
the function returns `true` because there are no entries in it that _do not_ match the predicate.
See a more
detailed explanation of this logic concept in ["Vacuous truth"](https://en.wikipedia.org/wiki/Vacuous_truth)
article.
@sample samples.collections.Collections.Aggregates.all
public inline fun <K, V> Map<out K,
V>.all(predicate: (Map.Entry<K, V>) -> Boolean): Boolean {
if (isEmpty()) return true
for (element in this)
if (!predicate(element)) return false
return true}
Returns `true` if map has at least one entry.
@sample samples.collections.Collections.Aggregates.any
public fun <K, V> Map<out K, V>.any(): Boolean
{
return !isEmpty()}
Returns `true` if at least one entry matches the given [predicate].
@sample samples.collections.Collections.Aggregates.anyWithPredicate
public inline fun <K, V> Map<out K,
V>.any(predicate: (Map.Entry<K, V>) -> Boolean): Boolean {
if (isEmpty())
return false
for (element in this) if (predicate(element)) return true
return false}
Returns the
number of entries in this map.
@kotlin.internal.InlineOnly
public inline fun <K, V> Map<out K, V>.count():
Int {
return size}
Returns the number of entries matching the given [predicate].
public inline
fun <K, V> Map<out K, V>.count(predicate: (Map.Entry<K, V>) -> Boolean): Int {
if (isEmpty()) return 0
var count = 0
for (element in this) if (predicate(element)) ++count
return count}
Performs the
given [action] on each entry.
@kotlin.internal.HidesMembers
public inline fun <K, V> Map<out K,
V>.forEach(action: (Map.Entry<K, V>) -> Unit): Unit {
for (element in this) action(element)}
Returns the first entry yielding the largest value of the given function.
@throws NoSuchElementException
if the map is empty.
@sample samples.collections.Collections.Aggregates.maxBy
@kotlin.SinceKotlin("1.7")
@kotlin.jvm.JvmName("maxByOrThrow")
@kotlin.internal.InlineOnly
@Suppress

Char.toLowerCase(): Char\n\n/**\n * Converts this character to lower case using Unicode mapping rules of the invariant locale.\n * This function performs one-to-one character mapping.\n * To support one-to-many character mapping use the [lowercase] function.\n * If this character has no mapping equivalent, the character itself
```

is returned.  
`@sample samples.text.Chars.lowercase`

`Char.lowercaseChar(): Char`  
 Converts this character to lower case using Unicode mapping rules of the invariant locale.  
 This function supports one-to-many character mapping, thus the length of the returned string can be greater than one.  
 For example, `'\u0130'.lowercase()` returns `''\u0069\u0307''`, where `'\u0130'` is the LATIN CAPITAL LETTER I WITH DOT ABOVE character (`^\u0130`).  
 If this character has no lower case mapping, the result of `toString()` of this char is returned.  
`@sample samples.text.Chars.lowercase`

`Char.lowercase(): String`  
 Converts this character to upper case using Unicode mapping rules of the invariant locale.  
 Use `uppercaseChar()` instead.  
`ReplaceWith("uppercaseChar()")`  
`@DeprecatedSinceKotlin("1.5")`  
 Converts this character to upper case using Unicode mapping rules of the invariant locale.  
 This function performs one-to-one character mapping.  
 To support one-to-many character mapping use the `[uppercase]` function.  
 If this character has no mapping equivalent, the character itself is returned.  
`@sample samples.text.Chars.uppercase`

`Char.uppercaseChar(): Char`  
 Converts this character to upper case using Unicode mapping rules of the invariant locale.  
 This function supports one-to-many character mapping, thus the length of the returned string can be greater than one.  
 For example, `'\uFB00'.uppercase()` returns `''\u0046\u0046''`, where `'\uFB00'` is the LATIN SMALL LIGATURE FF character (`^\ufb00`).  
 If this character has no upper case mapping, the result of `toString()` of this char is returned.  
`@sample samples.text.Chars.uppercase`

`Char.uppercase(): String`  
 Converts this character to title case using Unicode mapping rules of the invariant locale.  
 This function performs one-to-one character mapping.  
 To support one-to-many character mapping use the `[titlecase]` function.  
 If this character has no mapping equivalent, the result of calling `[uppercaseChar]` is returned.  
`@sample samples.text.Chars.titlecase`

`Char.titlecaseChar(): Char`  
 Converts this character to title case using Unicode mapping rules of the invariant locale.  
 This function supports one-to-many character mapping, thus the length of the returned string can be greater than one.  
 For example, `'\uFB00'.titlecase()` returns `''\u0046\u0066''`, where `'\uFB00'` is the LATIN SMALL LIGATURE FF character (`^\ufb00`).  
 If this character has no title case mapping, the result of `[uppercase]` is returned instead.  
`@sample samples.text.Chars.titlecase`

`Char.titlecase(): String = titlecaseImpl()`  
 Concatenates this Char and a String.  
`@sample samples.text.Chars.plus`

`Char.plus(other: String): String = this.toString() + other`  
 Returns `true` if this character is equal to the `[other]` character, optionally ignoring character case.  
 Two characters are considered equal ignoring case if `Char.uppercaseChar().lowercaseChar()` on each character produces the same result.  
`@param ignoreCase true` to ignore character case when comparing characters. By default `false`.  
`@sample samples.text.Chars.equals`

`Char.equals(other: Char, ignoreCase: Boolean = false): Boolean`  
 if `(this == other) return true`  
 if `(!ignoreCase) return false`  
 val `thisUpper = this.uppercaseChar()`  
 val `otherUpper = other.uppercaseChar()`  
 return `thisUpper == otherUpper || thisUpper.lowercaseChar() == otherUpper.lowercaseChar()`  
 Returns `true` if this character is a Unicode surrogate code unit.

`Char.isSurrogate(): Boolean = this in Char.MIN_SURROGATE..Char.MAX_SURROGATE`  
 Returns the Unicode general category of this character.

`Char.category: CharCategory`  
 Returns `true` if this character (Unicode code point) is defined in Unicode.  
 A character is considered to be defined in Unicode if its `[category]` is not `[CharCategory.UNASSIGNED]`.

`Char.isDefined(): Boolean`

```

function to each element of the original sequence and appends the results to the given [destination]. The operation is `_terminal_`.

```
public inline fun <T, R, C : MutableCollection<in R>>
Sequence<T>.mapTo(destination: C, transform: (T) -> R): C {
    for (item in this)
        destination.add(transform(item))
    return destination
}
```

Returns a sequence that wraps each element of the original sequence into an [IndexedValue] containing the index of that element and the element itself. The operation is `_intermediate_` and `_stateless_`.

```
public fun <T> Sequence<T>.withIndex():
Sequence<IndexedValue<T>> {
    return IndexingSequence(this)
}
```

Returns a sequence containing only distinct elements from the given sequence. Among equal elements of the given sequence, only the first one will be present in the resulting sequence. The elements in the resulting sequence are in the same order as they were in the source sequence. The operation is `_intermediate_` and `_stateful_`.

```
@sample samples.collections.Collections.Transformations.distinctAndDistinctBy
public fun <T> Sequence<T>.distinct(): Sequence<T> {
    return this.distinctBy { it }
}
```

Returns a sequence containing only elements from the given sequence having distinct keys returned by the given [selector] function. Among elements of the given sequence with equal keys, only the first one will be present in the resulting sequence. The elements in the resulting sequence are in the same order as they were in the source sequence. The operation is `_intermediate_` and `_stateful_`.

```
@sample
samples.collections.Collections.Transformations.distinctAndDistinctBy
public fun <T, K>
Sequence<T>.distinctBy(selector: (T) -> K): Sequence<T> {
    return DistinctSequence(this, selector)
}
```

Returns a new [MutableSet] containing all distinct elements from the given sequence. The returned set preserves the element iteration order of the original sequence. The operation is `_terminal_`.

```
public fun <T> Sequence<T>.toMutableSet(): MutableSet<T> {
    val set = LinkedHashSet<T>()
    for (item in this)
        set.add(item)
    return set
}
```

Returns `true` if all elements match the given [predicate]. Note that if the sequence contains no elements, the function returns `true` because there are no elements in it that do not match the predicate. See a more detailed explanation of this logic concept in ["Vacuous truth"](https://en.wikipedia.org/wiki/Vacuous\_truth) article. The operation is `_terminal_`.

```
@sample
samples.collections.Collections.Aggregates.all
public inline fun <T> Sequence<T>.all(predicate: (T) ->
Boolean): Boolean {
    for (element in this) if (!predicate(element)) return false
    return true
}
```

Returns `true` if sequence has at least one element. The operation is `_terminal_`.

```
@sample
samples.collections.Collections.Aggregates.any
public fun <T> Sequence<T>.any(): Boolean {
    return iterator().hasNext()
}
```

Returns `true` if at least one element matches the given [predicate]. The operation is `_terminal_`.

```
@sample samples.collections.Collections.Aggregates.anyWithPredicate
public inline fun <T> Sequence<T>.any(predicate: (T) -> Boolean): Boolean {
    for (element in this) if (predicate(element)) return true
    return false
}
```

Returns the number of elements in this sequence. The operation is `_terminal_`.

```
public fun <T> Sequence<T>.count(): Int {
    var count = 0
    for (element in this) checkCountOverflow(++count)
    return count
}
```

Returns the number of elements matching the given [predicate]. The operation is `_terminal_`.

```
public inline fun <T>
Sequence<T>.count(predicate: (T) -> Boolean): Int {
    var count = 0
    for (element in this) if (predicate(element)) checkCountOverflow(++count)
    return count
}
```

Accumulates value starting with [initial] value and applying [operation] from left to right to current accumulator value and each element. Returns the specified [initial] value if the sequence is empty. @param [operation] function that takes current accumulator value and an element, and calculates the next accumulator value. The operation is `_terminal_`.

```
public inline fun <T, R> Sequence<T>.fold(initial: R, operation: (acc: R, T) -> R): R {
    var accumulator = initial
    for (element in this) accumulator = operation(accumulator, element)
    return accumulator
}
```

Accumulates value starting with [initial] value and applying [operation] from left to right to current accumulator value and each element with its index in the original sequence. Returns the specified [initial] value if the sequence is empty. @param [operation] function that takes the index of an element, current accumulator value and the element itself, and calculates the next accumulator value. The operation is `_terminal_`.

```
public inline fun <T, R> Sequence<T>.foldIndexed(initial: R, operation: (index: Int, acc: R, T) ->
```

    return destination
}

```

\n \* Applies the given [transform] function to each character and its index in the original char sequence\n \* and appends the results to the given [destination].\n \* @param [transform] function that takes the index of a character and the character itself\n \* and returns the result of the transform applied to the character.\n \*

```

public inline fun <R, C : MutableCollection<in R>> CharSequence.mapIndexedTo(destination: C, transform: (index: Int, Char) -> R): C {
    var index = 0
    for (item in this)
        destination.add(transform(index++, item))
    return destination
}

```

\n \* Returns a list containing only the non-null results of applying the given [transform] function\n \* to each character in the original char sequence.\n \* \n \* @sample

```

samples.collections.Collections.Transformations.mapNotNull\n *
public inline fun <R : Any> CharSequence.mapNotNull(transform: (Char) -> R?): List<R> {
    return mapNotNullTo(ArrayList<R>(), transform)
}

```

\n \* Applies the given [transform] function to each character in the original char sequence\n \* and appends only the non-null results to the given [destination].\n \*

```

public inline fun <R : Any, C : MutableCollection<in R>> CharSequence.mapNotNullTo(destination: C, transform: (Char) -> R?): C {
    forEach { element -> transform(element)?.let { destination.add(it) } }
    return destination
}

```

\n \* Applies the given [transform] function to each character of the original char sequence\n \* and appends the results to the given [destination].\n \*

```

public inline fun <R, C : MutableCollection<in R>> CharSequence.mapTo(destination: C, transform: (Char) -> R): C {
    for (item in this)
        destination.add(transform(item))
    return destination
}

```

\n \* Returns a lazy [Iterable] that wraps each character of the original

char sequence into an [IndexedValue] containing the index of that character and the character itself.

```

public fun CharSequence.withIndex(): Iterable<IndexedValue<Char>> {
    return IndexingIterable { iterator() }
}

```

Returns `true` if all characters match the given [predicate]. Note that if the char sequence contains no characters, the function returns `true` because there are no characters in it that do not match the predicate. See a more detailed explanation of this logic concept in [\"Vacuous truth\"]([https://en.wikipedia.org/wiki/Vacuuous\\_truth](https://en.wikipedia.org/wiki/Vacuuous_truth)) article.

@sample

```

samples.collections.Collections.Aggregates.all
public inline fun CharSequence.all(predicate: (Char) -> Boolean): Boolean {
    for (element in this) if (!predicate(element)) return false
    return true
}

```

Returns `true` if char sequence has at least one character.

@sample

```

samples.collections.Collections.Aggregates.any
public fun CharSequence.any(): Boolean {
    return !isEmpty()
}

```

Returns `true` if at least one character matches the given [predicate].

@sample

```

samples.collections.Collections.Aggregates.anyWithPredicate
public inline fun CharSequence.any(predicate: (Char) -> Boolean): Boolean {
    for (element in this) if (predicate(element)) return true
    return false
}

```

Returns the length of this char sequence.

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.count(): Int {
    return length
}

```

Returns the number of characters matching the given [predicate].

```

public inline fun CharSequence.count(predicate: (Char) -> Boolean): Int {
    var count = 0
    for (element in this) if (predicate(element)) ++count
    return count
}

```

Accumulates value starting with [initial] value and applying [operation] from left to right to current accumulator value and each character.

Returns the specified [initial] value if the char sequence is empty.

@param [operation] function that takes current accumulator value and a character, and calculates the next accumulator value.

```

public inline fun <R> CharSequence.fold(initial: R, operation: (acc: R, Char) -> R): R {
    var accumulator = initial
    for (element in this) accumulator = operation(accumulator, element)
    return accumulator
}

```

Accumulates value starting with [initial] value and applying [operation] from left to right to current accumulator value and each character with its index in the original char sequence.

Returns the specified [initial] value if the char sequence is empty.

@param [operation] function that takes the index of a character, current accumulator value and the character itself, and calculates the next accumulator value.

```

public inline fun <R> CharSequence.foldIndexed(initial: R, operation: (index: Int, acc: R, Char) -> R): R {
    var index = 0
    var accumulator = initial
    for (element in this) accumulator = operation(index++, accumulator, element)
    return accumulator
}

```

Accumulates value starting with [initial] value and applying [operation] from right to left to each character and current accumulator value.

Returns the specified [initial] value if the char sequence is empty.

@param [operation] function that takes a character and current accumulator value, and calculates the next accumulator value.

```

public inline fun <R> CharSequence.foldRight(initial: R, operation: (Char, acc: R) -> R): R {
    var index = lastIndex
    var accumulator = initial
    while (index >= 0) {
        accumulator = operation(get(index--), accumulator)
    }
    return accumulator
}

```

Accumulates value starting with [initial] value and applying [operation] from right to left to each character with its index in the original char sequence and current accumulator value.

Returns the specified [initial] value if the char sequence is empty.

@param [operation] function that takes the index of a character, the character itself and current accumulator value, and calculates the next accumulator value.

```

public inline fun <R> CharSequence.foldRightIndexed(initial: R, operation: (index: Int, Char, acc: R) -> R): R {
    var index = lastIndex
    var accumulator = initial
    while (index >= 0) {
        accumulator = operation(index, get(index), accumulator)
        --index
    }
    return accumulator
}

```

Performs the given [action] on each character.

```

public inline fun CharSequence.forEach(action: (Char) -> Unit): Unit {
    for (element in this) action(element)
}

```

Performs the given [action] on each character, providing sequential index with the character.

@param [action] function that takes the index of a character and the character itself and performs the action on the character.

```

public inline fun CharSequence.forEachIndexed(action: (index:

```

version of split which receives single non-empty delimiter and offers better performance
String used as delimiter
@param ignoreCase `true` to ignore character case when matching a delimiter. By
default `false`.
@param limit The maximum number of substrings to return.
private fun
CharSequence.split(delimiter: String, ignoreCase: Boolean, limit: Int): List<String> {
    requireNonNegativeLimit(limit)
    var currentOffset = 0
    var nextIndex = indexOf(delimiter, currentOffset, ignoreCase)
    if (nextIndex == -1 ||
        limit == 1) {
        return listOf(this.toString())
    }
    val isLimited = limit > 0
    val result =
        ArrayList<String>(if (isLimited) limit.coerceAtMost(10) else 10)
    do {
        result.add(substring(currentOffset,
            nextIndex))
        currentOffset = nextIndex + delimiter.length
        // Do not search for next occurrence if we're
        reaching limit
        if (isLimited && result.size == limit - 1) break
        nextIndex = indexOf(delimiter,
            currentOffset, ignoreCase)
    } while (nextIndex != -1)
    result.add(substring(currentOffset, length))
    return result
}

Splits this char sequence to a list of strings around matches of the given regular expression.
@param limit Non-negative value specifying the maximum number of substrings to return.
Zero by default
means no limit is set.
@kotlin.internal.InlineOnly
public inline fun CharSequence.split(regex: Regex, limit: Int = 0): List<String> =
    regex.split(this, limit)

Splits this char sequence to a sequence of strings around matches of the given regular expression.
@param limit Non-negative value specifying the maximum number of substrings to return.
Zero by default means no limit is
set.
@sample samples.text.Strings.splitToSequence
@SinceKotlin("1.6")
@WasExperimental(ExperimentalStdlibApi::class)
@kotlin.internal.InlineOnly
public inline fun CharSequence.splitToSequence(regex: Regex, limit: Int = 0): Sequence<String> =
    regex.splitToSequence(this, limit)

Splits this char sequence to a sequence of lines delimited by any of the
following character sequences: CRLF, LF or CR.
The lines returned do not include terminating line
separators.
public fun CharSequence.lineSequence(): Sequence<String> = splitToSequence("\\r\\n", "\\n",
    "\\r")

Splits this char
sequence to a list of lines delimited by any of the following character sequences: CRLF, LF or CR.
The
lines returned do not include terminating line separators.
public fun CharSequence.lines(): List<String> =
    lineSequence().toList()

Returns `true` if the contents of this char sequence are equal to the contents of the
specified [other],
i.e. both char sequences contain the same number of the same characters in the same order.
@sample samples.text.Strings.contentEquals
@SinceKotlin("1.5")
public expect infix fun
CharSequence?.contentEquals(other: CharSequence?): Boolean

Returns `true` if the contents of this char
sequence are equal to the contents of the specified [other], optionally ignoring case difference.
@param
ignoreCase `true` to ignore character case when comparing contents.
@sample
samples.text.Strings.contentEquals
@SinceKotlin("1.5")
public expect fun
CharSequence?.contentEquals(other: CharSequence?,
    ignoreCase: Boolean): Boolean

internal fun CharSequence?.contentEqualsIgnoreCaseImpl(other:
    CharSequence?): Boolean {
    if (this is String && other is String) {
        return this.equals(other, ignoreCase =
            true)
    }
    if (this === other) return true
    if (this == null || other == null || this.length != other.length) return
    false
    for (i in 0 until length) {
        if (!this[i].equals(other[i], ignoreCase = true)) {
            return false
        }
    }
    return true
}

internal fun CharSequence?.contentEqualsImpl(other: CharSequence?): Boolean {
    if (this is String && other is String) {
        return this == other
    }
    if (this === other) return true
    if (this
        == null || other == null || this.length != other.length) return false
    for (i in 0 until length) {
        if (this[i] !=
            other[i]) {
            return false
        }
    }
    return true
}

Returns `true` if the content of this
string
is equal to the word `true`, `false` if it is equal to `false`,
and throws an exception otherwise.
There is
also a lenient version of the function available on nullable String, [String?.toBoolean].
Note that this function is
case-sensitive.
@sample samples.text.Strings.toBooleanStrict
@SinceKotlin("1.5")
public fun
String.toBooleanStrict(): Boolean = when (this) {
    "true" -> true
    "false" -> false
    else -> throw
    IllegalArgumentException("The string doesn't represent a boolean value: $this")
}

Returns `true` if the

```

```

content of this string is equal to the word `true`, `false` if it is equal to `false`, `null` otherwise.
There is also a lenient version of the function available on nullable String, [String?.toBoolean].
Note that this function is case-sensitive.

Returns a random element from this range, or `null` if this
range is empty.

@SinceKotlin("1.5")@WasExperimental(ExperimentalStdlibApi::class,
ExperimentalUnsignedTypes::class)@kotlin.internal.InlineOnly
public inline fun ULongRange.randomOrNull():
ULong? {
    return randomOrNull(Random)
}

Returns a random element from this range using the
specified source of randomness, or `null` if this range is empty.

@SinceKotlin("1.5")@WasExperimental(ExperimentalStdlibApi::class,
ExperimentalUnsignedTypes::class)
public fun UIntRange.randomOrNull(random:
Random): UInt? {
    if (isEmpty())
        return null
    return random.nextUInt(this)
}

Returns a
random element from this range using the specified source of randomness, or `null` if this range is empty.

@SinceKotlin("1.5")@WasExperimental(ExperimentalStdlibApi::class,
ExperimentalUnsignedTypes::class)
public fun ULongRange.randomOrNull(random: Random): ULong? {
    if
(isEmpty())
        return null
    return random.nextULong(this)
}

Returns `true` if this range contains
the specified [element].

* Always returns `false` if the [element] is `null`.

@SinceKotlin("1.5")@WasExperimental(ExperimentalUnsignedTypes::class)@kotlin.internal.InlineOnly
public inline operator fun UIntRange.contains(element: UInt?): Boolean {
    return element != null &&
contains(element)
}

Returns `true` if this range contains the specified [element].

* Always returns
`false` if the [element] is `null`.

@SinceKotlin("1.5")@WasExperimental(ExperimentalUnsignedTypes::class)@kotlin.internal.InlineOnly
public
inline operator fun ULongRange.contains(element: ULong?): Boolean {
    return element != null &&
contains(element)
}

Checks if the specified [value] belongs to this range.

@SinceKotlin("1.5")@WasExperimental(ExperimentalUnsignedTypes::class)
public operator fun
UIntRange.contains(value: UByte): Boolean {
    return contains(value.toInt())
}

Checks if the
specified [value] belongs to this range.

@SinceKotlin("1.5")@WasExperimental(ExperimentalUnsignedTypes::class)
public operator fun
ULongRange.contains(value: UByte): Boolean {
    return contains(value.toULong())
}

Checks if the
specified [value] belongs to this range.

@SinceKotlin("1.5")@WasExperimental(ExperimentalUnsignedTypes::class)
public operator fun
ULongRange.contains(value: UInt): Boolean {
    return contains(value.toULong())
}

Checks
if the specified [value] belongs to this range.

@SinceKotlin("1.5")@WasExperimental(ExperimentalUnsignedTypes::class)
public operator fun
UIntRange.contains(value: ULong): Boolean {
    return (value shr UInt.SIZE_BITS) == 0uL &&
contains(value.toInt())
}

Checks if the specified [value] belongs to this range.

@SinceKotlin("1.5")@WasExperimental(ExperimentalUnsignedTypes::class)
public operator fun
UIntRange.contains(value: UShort): Boolean {
    return contains(value.toInt())
}

Checks if the
specified [value] belongs to this range.

@SinceKotlin("1.5")@WasExperimental(ExperimentalUnsignedTypes::class)
public operator fun
ULongRange.contains(value: UShort): Boolean {
    return contains(value.toULong())
}

Returns a
progression from this value down to the specified [to] value with the step -1.

* The [to] value should be less
than or equal to `this` value.

* If the [to] value is greater than `this` value the
returned progression is empty.

```

A collection that holds pairs of objects (keys and values) and supports efficiently retrieving the value corresponding to each key. Map keys are unique; the map holds only one value for each key. Methods in this interface support only read-only access to the map; read-write access is supported through the [MutableMap] interface.

@param K the type of map keys. The map is invariant in its key type, as it can accept key as a parameter (of [containsKey] for example) and return it in [keys] set.

@param V the type of map values. The map is covariant in its value type.

```

public interface Map<K, out V> {
    // Query Operations
    /**
     * Returns the number of key/value pairs in the map.
     */
    public val size: Int
    /**
     * Returns `true` if the map is empty (contains no elements), `false` otherwise.
     */
    public fun isEmpty(): Boolean
    /**
     * Returns `true` if the map contains the specified [key].
     */
    public fun containsKey(key: K): Boolean
    /**
     * Returns `true` if the map maps one or more keys to the specified [value].
     */
    public fun containsValue(value: @UnsafeVariance V): Boolean
    /**
     * Returns the value corresponding to the given [key], or `null` if such a key is not present in the map.
     */
    public operator fun get(key: K): V?
    /**
     * Returns the value corresponding to the given [key], or [defaultValue] if such a key is not present in the map.
     * @since JDK 1.8
     */
    @SinceKotlin("1.1")
    @PlatformDependent
    public fun getOrDefault(key: K, defaultValue: @UnsafeVariance V): V {
        // See default implementation in JDK sources
        throw NotImplementedError()
    }
    // Views
    /**
     * Returns a read-only [Set] of all keys in this map.
     */

```

produces mangled names for functions with parameters, which is unnatural for usual JavaScript developer.

You can put `@JsName(...)` on functions you want to be available from JavaScript. For some reason you want to rename declaration, e.g. there's common term in JavaScript for a concept provided by the declaration, which is uncommon in Kotlin. Example:

```
kotlin
class Person(val name: String) {
    fun hello() {
        println("Hello $name!")
    }
}
@JsName("helloWithGreeting")
fun hello(greeting: String) {
    println("$greeting $name!")
}
```

`@property name` the name which compiler uses both for declaration itself and for all references to the declaration. It's required to denote a valid JavaScript identifier.

```
@Retention(AnnotationRetention.BINARY)
@Target(CLASS, FUNCTION, PROPERTY, CONSTRUCTOR,
PROPERTY_GETTER, PROPERTY_SETTER)
public actual annotation class JsName(actual val name:
```

```
String)
Denotes an 'external' declaration that must be imported from native JavaScript library.
```

The compiler produces the code relevant for the target module system, for example, in case of CommonJS, it will import the declaration via the `require(...)` function. The annotation can be used on top-level external declarations (classes, properties, functions) and files. In case of file (which can't be 'external') the following rule applies: all the declarations in the file must be 'external'. By applying `@JsModule(...)` on a file you tell the compiler to import a

```
JavaScript object that contain all the declarations from the file.
Example:
kotlin
@JsModule("jquery")
external abstract class JQuery() {
    // some declarations here
}
@JsModule("jquery")
external fun JQuery(element: Element): JQuery
@property import name
of a module to import declaration from.
It is not interpreted by the Kotlin compiler, it's passed as is
directly to the target module system. @see JsNonModule
```

```
@Retention(AnnotationRetention.BINARY)
@Target(CLASS, PROPERTY, FUNCTION, FILE)
public
annotation class JsModule(val import: String)
Denotes an 'external' declaration that can be used without
module system. By default, an 'external' declaration is available regardless your target module system.
However, by applying [JsModule] annotation you can make a declaration unavailable to 'plain' module system.
Some JavaScript libraries are distributed both as
```

a standalone downloadable piece of JavaScript and as a module available as an npm package. To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation. For example:

```
kotlin
@JsModule("jquery")
@JsNonModule
@JsName("$")
external
abstract class JQuery() {
    // some declarations here
}
@JsModule("jquery")
@JsNonModule
@JsName("$")
external fun JQuery(element: Element): JQuery
@see JsModule
@Retention(AnnotationRetention.BINARY)
@Target(CLASS, PROPERTY, FUNCTION, FILE)
public
annotation class JsNonModule
Adds prefix to 'external' declarations in a source file.
JavaScript
does not have concept of packages (namespaces). They are usually emulated by nested objects.
The compiler
turns references to 'external' declarations either to plain unprefix names (in case of 'plain' modules) or to
plain imports.
However,
```

if a JavaScript library provides its declarations in packages, you won't be satisfied with this. You can tell the compiler to generate additional prefix before references to 'external' declarations using the `@JsQualifier(...)` annotation.

Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-'external' declarations. Example:

```
@file:JsQualifier("my.jsPackageName")
package
some.kotlinPackage
external fun foo(x: Int)
external fun bar(): String
@property value
the qualifier to add to the declarations in the generated code.
It must be a sequence of valid JavaScript
identifiers separated by the `.` character.
Examples of valid qualifiers are: `foo`, `bar.Baz`, `_.$.f`
```

```
@see JsModule
@Retention(AnnotationRetention.BINARY)
@Target(AnnotationTarget.FILE)
public
annotation class JsQualifier(val value: String)
Exports top-level declaration
```

on JS platform. Compiled module exposes declarations that are marked with this annotation without name mangling. This annotation can be applied to either files or top-level declarations. It is currently prohibited to export the following kinds of declarations: `*`expect` declarations`, `* inline functions with`

```

reified type parameters\n * * suspend functions\n * * secondary constructors without `@JsName`\n * *

radians.\n *
Special cases:\n * - `asin(x)` is `NaN`, when `abs(x) > 1` or x is `NaN`\n */\n\n@SinceKotlin("1.2")\n@InlineOnly\npublic actual inline fun asin(x: Double): Double =
```

`nativeMath.asin(x)` Computes the arc cosine of the value  $[x]$ ; the returned value is an angle in the range from  $0.0$  to  $\text{PI}$  radians. Special cases: `acos(x)` is `NaN`, when `abs(x) > 1` or `x` is `NaN`.
   
`nativeMath.acos(x)` Computes the arc tangent of the value  $[x]$ ; the returned value is an angle in the range from  $-\text{PI}/2$  to  $\text{PI}/2$  radians. Special cases: `atan(NaN)` is `NaN`.
   
`nativeMath.atan(x)` Returns the angle  $\theta$  of the polar coordinates  $(r, \theta)$  that correspond to the rectangular coordinates  $(x, y)$  by computing the arc tangent of the value  $[y] / [x]$ ; the returned value is an angle in the range from  $-\text{PI}$  to  $\text{PI}$  radians. Special cases: `atan2(0.0, 0.0)` is `0.0`; `atan2(0.0, x)` is `0.0` for  $x > 0$  and  $\text{PI}$  for  $x < 0$ ; `atan2(-0.0, x)` is `-0.0` for  $x > 0$  and  $-\text{PI}$  for  $x < 0$ ; `atan2(y, +Inf)` is `0.0` for  $0 < y < +\text{Inf}$  and `-0.0` for  $-\text{Inf} < y < 0$ ; `atan2(y, -Inf)` is  $\text{PI}$  for  $0 < y < +\text{Inf}$  and  $-\text{PI}$  for  $-\text{Inf} < y < 0$ ; `atan2(y, 0.0)` is  $\text{PI}/2$  for  $y > 0$  and  $-\text{PI}/2$  for  $y < 0$ ; `atan2(+Inf, x)` is  $\text{PI}/2$  for finite  $x$ ; `atan2(-Inf, x)` is  $-\text{PI}/2$  for finite  $x$ ; `atan2(NaN, x)` and `atan2(y, NaN)` is `NaN`.
   
`nativeMath.atanh(x)` Computes the inverse hyperbolic sine of the value  $[x]$ . Special cases: `asinh(NaN)` is `NaN`; `asinh(+Inf)` is `+Inf`; `asinh(-Inf)` is `-Inf`.
   
`nativeMath.cosh(x)` Computes the hyperbolic cosine of the value  $[x]$ . Special cases: `cosh(NaN)` is `NaN`; `cosh(+Inf)` is `+Inf`; `cosh(-Inf)` is `+Inf`.
   
`nativeMath.cosh(x)` Computes the hyperbolic tangent of the value  $[x]$ . Special cases: `tanh(NaN)` is `NaN`; `tanh(+Inf)` is `1.0`; `tanh(-Inf)` is `-1.0`.
   
`nativeMath.tanh(x)` Computes the inverse hyperbolic sine of the value  $[x]$ . The returned value is  $y$  such that  $\sinh(y) = x$ . Special cases: `asinh(NaN)` is `NaN`; `asinh(+Inf)` is `+Inf`; `asinh(-Inf)` is `-Inf`.
   
`nativeMath.acosh(x)` Computes the inverse hyperbolic cosine of the value  $[x]$ . The returned value is positive  $y$  such that  $\cosh(y) = x$ . Special cases: `acosh(NaN)` is `NaN`; `acosh(x)` is `NaN` when  $x < 1$ ; `acosh(+Inf)` is `+Inf`.
   
`nativeMath.atanh(x)` Computes the inverse hyperbolic tangent of the value  $[x]$ . The returned value is  $y$  such that  $\tanh(y) = x$ . Special cases: `atanh(NaN)` is `NaN`; `atanh(x)` is `NaN` when  $x > 1$  or  $x < -1$ ; `atanh(1.0)` is `+Inf`; `atanh(-1.0)` is `-Inf`.
   
`nativeMath.hypot(x, y)` Computes  $\sqrt{x^2 + y^2}$  without intermediate overflow or underflow. Special cases: returns `+Inf` if any of arguments is infinite; returns `NaN` if any of arguments is `NaN` and the other is not infinite.
   
`nativeMath.sqrt(x)` Computes the positive square root of the value  $[x]$ . Special cases: `sqrt(x)` is `NaN` when  $x < 0$  or  $x$  is `NaN`.
   
`nativeMath.exp(x)` Computes Euler's number  $e$  raised to the power of the value  $[x]$ . Special cases: `exp(NaN)` is `NaN`; `exp(+Inf)` is `+Inf`; `exp(-Inf)` is `0.0`.
   
`nativeMath.expm1(x)` Computes  $\exp(x) - 1$ . This function can be implemented to produce more precise result for  $[x]$  near zero. Special cases: `expm1(NaN)` is `NaN`; `expm1(+Inf)` is `+Inf`; `expm1(-Inf)` is `-1.0`.
   
`nativeMath.log(x)` Computes the logarithm of the value  $[x]$  to the

given [base].  
Special cases:  
 $\log(x, b)$  is NaN if either  $x$  or  $b$  are NaN  
 $\log(x, b)$  is NaN when  $x < 0$  or  $b \leq 0$  or  $b == 1.0$   
 $\log(+Inf, +Inf)$  is NaN  
 $\log(+Inf, b)$  is  $+Inf$  for  $b > 1$  and  $-Inf$  for  $b < 1$   
 $\log(0.0, b)$  is  $-Inf$  for  $b > 1$  and  $+Inf$  for  $b < 1$   
See also logarithm functions for common fixed bases: [ln], [log10] and [log2].  
@SinceKotlin("1.2")  
public actual fun log(x: Double, base: Double): Double {  
if (base <= 0.0 || base == 1.0) return Double.NaN  
return nativeMath.log(x) / nativeMath.log(base)  
}  
Computes the natural logarithm (base 'E') of the value [x].  
Special cases:  
 $\ln(NaN)$  is NaN  
 $\ln(x)$  is NaN when  $x < 0.0$   
 $\ln(+Inf)$  is  $+Inf$   
 $\ln(0.0)$  is  $-Inf$   
@SinceKotlin("1.2")  
@InlineOnly  
public actual inline fun ln(x: Double): Double = nativeMath.log(x)  
Computes the common logarithm (base 10) of the value [x].  
@see [ln] function for special cases.  
@SinceKotlin("1.2")  
@InlineOnly  
public actual inline fun log10(x: Double): Double = nativeLog10(x)  
Computes the binary logarithm (base 2) of the value [x].  
@see [ln] function for special cases.  
@SinceKotlin("1.2")  
@InlineOnly  
public actual inline fun log2(x: Double): Double = nativeLog2(x)  
Computes  $\ln(x + 1)$ .  
This function can be implemented to produce more precise result for [x] near zero.  
Special cases:  
 $\ln1p(NaN)$  is NaN  
 $\ln1p(x)$  is NaN where  $x < -1.0$   
 $\ln1p(-1.0)$  is  $-Inf$   
 $\ln1p(+Inf)$  is  $+Inf$   
@see [ln] function  
@see [expm1] function  
@SinceKotlin("1.2")  
@InlineOnly  
public actual inline fun ln1p(x: Double): Double = nativeLog1p(x)  
Rounds the given value [x] to an integer towards positive infinity.  
@return the smallest double value that is greater than or equal to the given value [x] and is a mathematical integer.  
Special cases:  
 $\text{ceil}(x)$  is  $x$  where  $x$  is NaN or  $+Inf$  or  $-Inf$  or already a mathematical integer.  
@SinceKotlin("1.2")  
@InlineOnly  
public actual inline fun ceil(x: Double): Double = nativeMath.ceil(x)  
Rounds the given value [x] to an integer towards negative infinity.  
@return the largest double value that is smaller than or equal to the given value [x] and is a mathematical integer.  
Special cases:  
 $\text{floor}(x)$  is  $x$  where  $x$  is NaN or  $+Inf$  or  $-Inf$  or already a mathematical integer.  
@SinceKotlin("1.2")  
@InlineOnly  
public actual inline fun floor(x: Double): Double = nativeMath.floor(x)  
Rounds the given value [x] to an integer towards zero.  
@return the value [x] having its fractional part truncated.  
Special cases:  
 $\text{truncate}(x)$  is  $x$  where  $x$  is NaN or  $+Inf$  or  $-Inf$  or already a mathematical integer.  
@SinceKotlin("1.2")  
@InlineOnly  
public actual inline fun truncate(x: Double): Double = nativeTrunc(x)  
Rounds the given value [x] towards the closest integer with ties rounded towards even integer.  
Special cases:  
 $\text{round}(x)$  is  $x$  where  $x$  is NaN or  $+Inf$  or  $-Inf$  or already a mathematical integer.  
@SinceKotlin("1.2")  
public actual fun round(x: Double): Double {  
if (x % 0.5 != 0.0) {  
return nativeMath.round(x)  
} else {  
val floor = floor(x)  
return if (floor % 2 == 0.0) floor else ceil(x)  
}  
}  
Returns the absolute value of the given value [x].  
Special cases:  
 $\text{abs}(NaN)$  is NaN  
@see absoluteValue extension property for [Double]  
@SinceKotlin("1.2")  
@InlineOnly  
public actual inline fun abs(x: Double): Double = nativeMath.abs(x)  
Returns the sign of the given value [x]:  
 $-1.0$  if the value is negative,  
zero if the value is zero,  
 $1.0$  if the value is positive  
Special case:  
 $\text{sign}(NaN)$  is NaN  
@SinceKotlin("1.2")  
@InlineOnly  
public actual inline fun sign(x: Double): Double = nativeSign(x)  
Returns the smaller of two values.  
If either value is NaN, then the result is NaN.  
@SinceKotlin("1.2")  
@InlineOnly  
public actual inline fun min(a: Double, b: Double): Double = nativeMath.min(a, b)  
Returns the greater of two values.  
If either value is NaN, then the result is NaN.  
@SinceKotlin("1.2")  
@InlineOnly  
public actual inline fun max(a: Double, b: Double): Double = nativeMath.max(a, b)  
Returns the cube root of [x]. For any  $x$ ,  $\text{cbrt}(-x) == -\text{cbrt}(x)$ ; that is, the cube root of a negative value is the negative of the cube root of that value's magnitude.  
Special cases:  
If the argument is NaN, then the result is NaN.  
If the argument is infinite, then the result is an infinity with the same sign as the argument.  
If the argument is zero, then the result is a zero with the same sign as the argument.  
@SinceKotlin("1.8")

kotlin.annotation.AnnotationTarget.*\n\nimport kotlin.experimental.ExperimentalTypeInference\n\n\n/**\n * Allows to
infer generic type arguments of a function from the calls in the annotated function parameter of that function.\n * \n *
When this annotation is placed on a generic function parameter of a function,\n * it enables to infer the type
arguments of that generic function from the lambda body passed to that parameter.\n * \n * The calls that affect
inference are either members of the receiver type of an annotated function parameter or\n * extensions for that type.
The extensions must be themselves annotated with `@BuilderInference`.\n * \n * Example: we declare\n * ```\n * fun
<T> sequence(@BuilderInference block: suspend SequenceScope<T>().->Unit): Sequence<T>\n * ```\n * and use
it like\n * ```\n * val result = sequence { yield("result") }\n * ```\n * Here the type argument of the resulting
sequence is inferred to `String` from\n * the argument of the [SequenceScope.yield] function, that is called inside
the lambda passed to [sequence].\n * \n * Note: this annotation is experimental, see [ExperimentalTypeInference] on
how to opt-in for it.\n * \n *@Target(VALUE_PARAMETER, FUNCTION,
PROPERTY)\n@Retention(AnnotationRetention.BINARY)\n@SinceKotlin("1.3")\n@ExperimentalTypeInferenc
e\n\npublic annotation class BuilderInference\n\n\n/**\n * Enables overload selection based on the type of the value
returned from lambda argument.\n * \n * When two or more function overloads have otherwise the same parameter
lists that differ only in the return type\n * of a functional parameter, this annotation enables overload selection by
the type of the value returned from\n * the lambda function passed to this functional parameter.\n * \n * Example:\n *
```
*\n * @OverloadResolutionByLambdaReturnType\n * fun create(intProducer: () -> Int): Int\n * \n * fun

```

```

create(doubleProducer: () -> Double): Double
 * The annotation being applied to one of overloads allows to
 * resolve this ambiguity by analyzing what value is returned
 * from the lambda function. This annotation is
 * also used to discriminate the annotated overloads in case if overload selection still cannot
 * choose one of them
 * even taking in account the result of lambda parameter analysis. In that case a warning is reported.
 * Note: this
 * annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.

 *
 * Signals that the annotated annotation class is a marker of an API that requires an explicit opt-in.
 * Call sites
 * of any declaration that is either annotated with such a marker or mentions in its signature any
 * other declaration
 * that requires opt-in should opt in to the API either by using [OptIn],
 * or by being annotated with that marker
 * themselves, effectively causing further propagation of the opt-in requirement.
 * The intended uses of opt-in
 * markers include, but are not limited to the following:
 * - Experimental API for public preview that might change
 * its semantics or affect binary compatibility.
 * - Internal declarations that should not be used outside the declaring
 * library, but are `public` for technical reasons.
 * - Fragile or delicate API that needs a lot of expertise to use and
 * thus require an explicit opt-in.
 *
 * ## Contagiousness
 *
 * When a declaration is marked with an opt-in
 * requirement, it is considered to be contagious,
 * meaning that all its uses
 * or mentions in other declarations will require an explicit opt-in.
 * A rule of thumb for
 * propagating is the following: if the marked declaration ceases to exist, only
 * the places with explicit opt-in (or the
 * corresponding warning) will break. This rule does not imply transitivity,
 * e.g. the propagation does not propagate
 * opt-in through inlining, making it the responsibility of the function author
 * to mark it properly.
 *
 * ##
 * Type scopes
 *
 * A type is considered requiring opt-in if it is marked with an opt-in marker, or the outer
 * declaration (class or interface) requires opt-in.
 * Any use of any declaration that mentions such type in its

```

signature will require an explicit opt-in, even if it is not used directly on the call site, and even if such declarations do not require opt-in directly.

For example, consider the following declarations that are marked with non-propagating opt-in:

```

@UnstableApi class
Unstable {
    @OptIn(UnstableApi::class) fun foo(): Unstable = Unstable()
    @OptIn(UnstableApi::class) fun bar(arg: Unstable = Unstable()) {}
    @OptIn(UnstableApi::class) fun
Unstable?.baz() {}
}

```

and their respective call sites:

```

fun outerFun() {
    val s = foo()
    bar()
    null.baz()
}

```

Even though call sites do not mention `Unstable` type directly, the corresponding opt-in warning or error will be triggered in each call site due to propagation contagiousness. Note that the propagation is not transitive, i.e. calls to `outerFun` itself would not trigger any further opt-in requirements.

### Lexical scopes

If a type requires an opt-in, such requirement is propagated to its lexical scope and all its nested declarations. For example, for the following scope:

```

@UnstableApi class Unstable {
    fun memberFun() = ...
    class NestedClass {
        fun nestedFun() = ...
    }
}

```

Any use of `Unstable`, `NestedClass`, or their member functions will require an explicit opt-in.

### Overridden declarations

Opt-in markers are also propagated through the inheritance and interface implementation. If the base declaration requires an opt-in, overriding it requires either an explicit opt-in or propagating the opt-in requirement.

See also [Kotlin language documentation](https://kotlinlang.org/docs/opt-in-requirements.html) for more information.

@property message message to be reported on usages of API without an explicit opt-in, or empty string for the default message.

The default message is: `"This declaration is experimental and its usage should be marked with 'Marker' or '@OptIn(Marker::class)'"`, where `Marker` is the opt-in requirement marker.

@property level specifies how usages of API without an explicit opt-in are reported in code.

```

@Target(ANNOTATION_CLASS)@Retention(BINARY)@SinceKotlin("1.3")public annotation class
RequiresOptIn(val message: String = "", val level: Level = Level.ERROR) {
    /** Severity of the diagnostic that should be reported on usages which did not explicitly opted into the API either by using [OptIn] or by being annotated with the corresponding marker annotation.
    * @see RequiresOptIn for a detailed description of opt-in semantics and propagation rules.
    */
    public enum class Level {
        /** Specifies that a warning should be reported on incorrect usages of this API.
        * @see RequiresOptIn for a detailed description of opt-in semantics and propagation rules.
        */
        WARNING,
        /** Specifies that a compilation error should be reported on incorrect usages of this API.
        * @see RequiresOptIn for a detailed description of opt-in semantics and propagation rules.
        */
        ERROR,
    }
}

```

Allows to use the API denoted by the given markers in the annotated file, declaration, or expression. If a declaration is annotated with `[OptIn]`, its usages are **not** required to opt in to that API.

[markerClass] specifies marker annotations that require explicit opt-in. The marker annotation is not required to be itself marked with `[RequiresOptIn]` to enable gradual migration of API from requiring opt-in to the regular one, yet declaring such `OptIn` yields a compilation warning.

See also [Kotlin language documentation](https://kotlinlang.org/docs/opt-in-requirements.html) for more information.

@property markerClass specifies marker annotations that require explicit opt-in. @see RequiresOptIn for a detailed description of opt-in semantics and propagation rules.

```

@Target(CLASS, PROPERTY, LOCAL_VARIABLE, VALUE_PARAMETER, CONSTRUCTOR, FUNCTION, PROPERTY_GETTER, PROPERTY_SETTER, EXPRESSION, FILE, TYPEALIAS)@Retention(SOURCE)@SinceKotlin("1.3")public annotation class OptIn(
    vararg val markerClass: KClass<out Annotation>)

```

This annotation marks the experimental preview of the language feature `[SubclassOptInRequired]`.

> Note that this API is in a preview state and has a chance of being changed in the future.

Do not use it if you develop a library since your library can become source incompatible with the future versions of Kotlin.

```

@Target(CLASS)@Retention(BINARY)@SinceKotlin("1.8")public annotation class ExperimentalSubclassOptIn

```

Annotation that marks open for subclassing classes and interfaces, and makes implementation and extension of such declarations as requiring an explicit opt-in.

When applied, any attempt to subclass the target declaration will trigger an opt-in with the corresponding level and message.

The intended uses of subclass opt-in markers include, but are not limited to the following API:

- Stable to use, but unstable to implement due to its further evolution.
- Stable to use, but closed for

3rd-part implementations due to internal or technical reasons.\n \* - Stable to use, but delicate or fragile to implement.\n \* - Stable to use, but with a contract that may be weakened in the future in a backwards-incompatible\n

\* manner for external implementations.\n \*\n \* Contrary to regular [RequiresOptIn], there are three ways to opt-in into the subclassing requirement:\n \* - Annotate declaration with the marker annotation, making it propagating.\n \* - Annotate declaration with [OptIn] in order to opt in into the provided guarantees in a non-propagating manner.\n \* - Annotate declaration with [SubclassOptInRequired] with the same marker class, making it further propagating only for subclassing.\n \*\n \* Uses of this annotation are limited to open and abstract classes, and non-`fun` interfaces.\n \* Any other uses allowed by `CLASS` annotation target yield a compilation error.\n \*\n \* @property markerClass specifies marker annotation that require explicit opt-in.\n \* @see RequiresOptIn for a detailed description of opt-in semantics and propagation rules.\n

*\n\n@file:kotlin.jvm.JvmName(\"IntrinsicsKt\")\n@file:kotlin.jvm.JvmMultifileClass\n\npackage
kotlin.coroutines.intrinsics\n\nimport kotlin.contracts.*\nimport kotlin.coroutines.*\nimport
kotlin.internal.InlineOnly\n\n/**\n * Obtains the current continuation instance inside suspend functions and either
suspends\n * currently running
coroutine or returns result immediately without suspension.\n * \n * If the [block] returns the special
[CoroutineContext.SUSPENDED] value, it means that suspend function did suspend the execution and will\n * not
return any result immediately. In this case, the [Continuation] provided to the [block] shall be\n * resumed by
invoking [Continuation.resumeWith] at some moment in the\n * future when the result becomes available to resume
the computation.\n * \n * Otherwise, the return value of the [block] must have a type assignable to [T] and represents
the result of this suspend function.\n * It means that the execution was not suspended and the [Continuation]
provided to the [block] shall not be invoked.\n * As the result type of the [block] is declared as `Any?` and cannot be
correctly type-checked,\n * its proper return type remains on the conscience of the suspend function's author.\n * \n * Invocation of [Continuation.resumeWith] resumes coroutine directly in the invoker's thread without

```

going through the `[ContinuationInterceptor]` that might be present in the coroutine's `[CoroutineContext]`. It is the invoker's responsibility to ensure that a proper invocation context is established. `[Continuation.intercepted]` can be used to acquire the intercepted continuation. Note that it is not recommended to call either `[Continuation.resume]` nor `[Continuation.resumeWithException]` functions synchronously in the same stackframe where suspension function is run. Use `[suspendCoroutine]` as a safer way to obtain current continuation instance.

```

@SinceKotlin("1.3")@InlineOnly@Suppress("UNUSED_PARAMETER",
"RedundantSuspendModifier")
public suspend inline fun <T>
suspendCoroutineUninterceptedOrReturn(crossinline block: (Continuation<T> -> Any?): T {
    contract {
        callsInPlace(block, InvocationKind.EXACTLY_ONCE)
    }
    throw NotImplementedError("Implementation of
suspendCoroutineUninterceptedOrReturn is intrinsic")
}

```

This value is used as a return value of `[suspendCoroutineUninterceptedOrReturn]` `block` argument to state that the execution was suspended and will not return any result immediately. Note: this value should not be used in general code. Using it outside of the context of `[suspendCoroutineUninterceptedOrReturn]` function return value (including, but not limited to, storing this value in other properties, returning it from other functions, etc) can lead to unspecified behavior of the code.

It is implemented as property with getter to avoid ProGuard `<clinit>` problem with multifile `IntrinsicsKt` class.

```

@SinceKotlin("1.3")
public val COROUTINE_SUSPENDED:
Any get() = CoroutineSingletons.COROUTINE_SUSPENDED

```

Using enum here ensures two important properties:

1. It makes `SafeContinuation` serializable with all kinds of serialization frameworks (since all of them natively support enums).
2. It improves debugging experience, since you clearly see `toString()` value of those objects and what package they come from.

```

@SinceKotlin("1.3")@PublishedApi // This class is
Published API via serialized representation of SafeContinuation, don't rename/move
internal enum class
CoroutineSingletons { COROUTINE_SUSPENDED, UNDECIDED, RESUMED }

```

Copyright 2010-2022 JetBrains s.r.o. and Kotlin Programming Language contributors. Use of this source code is governed by the Apache 2.0 license that can be found in the `license/LICENSE.txt` file.

```

package kotlin.enums
import
kotlin.jvm.Volatile

```

A specialized immutable implementation of `[List]` interface that contains all enum entries of the specified enum type `[E]`. `[EnumEntries]` contains all enum entries in the order they are declared in the source code, consistently with the corresponding `[Enum.ordinal]` values. An instance of this interface can only be obtained from `EnumClass.entries` property.

```

@ExperimentalStdlibApi@SinceKotlin("1.8")
public sealed
interface EnumEntries<E : Enum<E>> :
List<E>
@PublishedApi@ExperimentalStdlibApi@SinceKotlin("1.8") // Used by JVM compiler
internal
fun <E : Enum<E>> enumEntries(entriesProvider: () -> Array<E>): EnumEntries<E> =
EnumEntriesList(entriesProvider)
@PublishedApi@ExperimentalStdlibApi@SinceKotlin("1.8") // Used by
Native/JS compilers and Java serialization
internal
fun <E : Enum<E>> enumEntries(entries: Array<E>):
EnumEntries<E> = EnumEntriesList { entries }.also {
    /* Here we are enforcing initialization of _entries
property. It is required because of two reasons.
1. In old Native mm the object will be frozen after
creation, so it must be immutable
2. Native doesn't support @Volatile for now, so this initialization is not
generally safe, if done after object is published.
This is very implementation-dependent hack,
and it should be removed when/if both reasons above are gone.
it.size
*/
}

```

For enum class `E`, this class is instantiated in the following manner (NB it's pseudocode that does not reflect code generation strategy precisely):

```

class E extends Enum<E> {
    private static final E[] $VALUES
    private static final EnumEntries[] $ENTRIES
    static {
        $VALUES = $values();
        val
supplier = #invokedynamic ..args.. values;
        $ENTRIES = new EnumEntriesList(supplier);
    }
    public static EnumEntries<MyEnum> getEntries() {
        return $ENTRIES;
    }
    private synthetic
static E[] $values() {
        return new E[] { ... };
    }
}

```

This machinery is required as a workaround for a long-standing issue when people do reflectively change `$VALUES` of enums in order to workaround project-specific issues. We allow racy initialization (e.g. `entriesProvider` can be invoked multiple times), but the resulting array is safely published, preventing

```

any read races after the initialization.\n *\n@SinceKotlin("1.8")\n@ExperimentalStdlibApi\nprivate class

package kotlin.experimental

The experimental marker for type inference augmenting annotations. Any usage of a declaration annotated with `@ExperimentalTypeInference` must be accepted either by annotating that usage with the `[OptIn]` annotation, e.g. `@OptIn(ExperimentalTypeInference::class)` or by using the compiler argument `-opt-in=kotlin.experimental.ExperimentalTypeInference`.

`@RequiresOptIn(level = RequiresOptIn.Level.ERROR)` `@MustBeDocumented` `@Retention(AnnotationRetention.BINARY)` `@Target(AnnotationTarget.ANNOTATION_CLASS)` `@SinceKotlin("1.3")` public annotation class ExperimentalTypeInference

Copyright 2010-2018 JetBrains s.r.o. and Kotlin Programming Language contributors. Use of this source code is governed by the Apache 2.0 license that can be found in the license/LICENSE.txt file.

package kotlin.internal

Specifies that the corresponding type should be ignored during type inference.

`@Target(AnnotationTarget.TYPE)` `@Retention(AnnotationRetention.BINARY)` internal annotation class NoInfer

Specifies that the constraint built for the type during type inference should be an equality one.

`@Target(AnnotationTarget.TYPE)` `@Retention(AnnotationRetention.BINARY)` internal annotation class Exact

Specifies that a corresponding member has the lowest priority in overload resolution.

`@Target(AnnotationTarget.FUNCTION, AnnotationTarget.PROPERTY, AnnotationTarget.CONSTRUCTOR)` `@Retention(AnnotationRetention.BINARY)` internal annotation class LowPriorityInOverloadResolution

Specifies that the corresponding member has the highest priority in overload resolution. Effectively this means that an extension annotated with this annotation will win in overload resolution over a member with the same signature.

`@Target(AnnotationTarget.FUNCTION, AnnotationTarget.PROPERTY)` `@Retention(AnnotationRetention.BINARY)` internal annotation class HidesMembers

The value of this type parameter should be mentioned in input types (argument types, receiver type or expected type).

`@Target(AnnotationTarget.TYPE_PARAMETER)` `@Retention(AnnotationRetention.BINARY)` internal annotation class OnlyInputTypes

Specifies that this function should not be called directly without inlining.

`@Target(AnnotationTarget.FUNCTION, AnnotationTarget.PROPERTY, AnnotationTarget.PROPERTY_GETTER, AnnotationTarget.PROPERTY_SETTER)` `@Retention(AnnotationRetention.BINARY)` internal annotation class InlineOnly

Specifies that this declaration can have dynamic receiver type.

`@Target(AnnotationTarget.FUNCTION, AnnotationTarget.PROPERTY)` `@Retention(AnnotationRetention.BINARY)` internal annotation class DynamicExtension

The value of this parameter should be a property reference expression (`this::foo`), referencing a `lateinit` property, the backing field of which is accessible at the point where the corresponding argument is passed.

`@Target(AnnotationTarget.VALUE_PARAMETER)` `@Retention(AnnotationRetention.BINARY)` `@SinceKotlin("1.2")` internal annotation class AccessibleLateinitPropertyLiteral

Specifies that this declaration is only completely supported since the specified version.

The Kotlin compiler of an earlier version is going to report a diagnostic on usages of this declaration.

The diagnostic message can be specified with [message], or via [errorCode] (takes less space, but might not be immediately clear to the user). The diagnostic severity can be specified with [level]: WARNING/ERROR

mean that either a warning or an error is going to be reported, HIDDEN means that the declaration is going to be removed from resolution completely.

[versionKind] specifies which version should be compared with the [version] value, when compiling the usage of the annotated declaration.

Note that prior to 1.2, only

[RequireKotlinVersionKind.LANGUAGE\_VERSION] was supported, so the Kotlin compiler before 1.2 is going to treat any [RequireKotlin] as if it requires the language version. Since 1.2, the Kotlin compiler supports [RequireKotlinVersionKind.LANGUAGE\_VERSION], [RequireKotlinVersionKind.COMPILER\_VERSION] and [RequireKotlinVersionKind.API\_VERSION]. If the actual value of [versionKind] is something different (e.g. a new version kind, added in future versions of Kotlin), Kotlin 1.2 is going to ignore this [RequireKotlin] altogether, whereas Kotlin before 1.2 is going to treat this as a requirement on the language version.

This

```
annotation is erased at compile time; its arguments are stored in a more compact form in the Kotlin metadata.

/**
 * An extension operator that allows delegating a mutable property of type [V]
 * to a property reference to a mutable property of the same type [V].
 * @receiver A property reference to a mutable property of type [V].
 * The reference is without a receiver, i.e. it either references a top-level property or
 * has the receiver bound to it.
 * Example:
 * ```
 * class Login(val username: String, var incorrectAttemptCounter: Int = 0) {
 *     val defaultLogin = Login("Admin")
 *     var defaultLoginAttempts by defaultLogin::incorrectAttemptCounter
 * // equivalent to
 * var defaultLoginAttempts: Int
 * get() = defaultLogin.incorrectAttemptCounter
 * set(value) { defaultLogin.incorrectAttemptCounter = value }
 * ```
 */
@SinceKotlin("1.4")
@kotlin.internal.InlineOnly
public inline operator fun <V> KMutableProperty0<V>.setValue(thisRef: Any?, property: KProperty<*>, value: V) {
    set(value)
}

/**
 * An extension operator that allows delegating a read-only member or extension property of type [V]
 * to a property reference to a member or extension property of type [V] or its subtype.
 * @receiver A property reference to a read-only or mutable property of type [V] or its subtype.
 * The reference has an unbound receiver of type [T].
 * Example:
 * ```
 * class Login(val username: String) {
 *     val Login.user by Login::username
 * // equivalent to
 * val Login.user get() = this.username
 * ```
 */

```

```

reading value can be advanced by the specified duration amount with the operator [plusAssign]:\n \* \n \* val timeSource = TestTimeSource()\n \* timeSource += 10.seconds\n \* \n \* Implementation note: the current reading value is stored as a [Long] number of nanoseconds,\n \* thus it's capable to represent a time range of approximately \u00b1292 years.\n \* Should the reading value overflow as the result of [plusAssign] operation, an [IllegalStateException] is thrown.\n

```
