Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

#### GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the

notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt

otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made

generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

#### NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF

MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>  
Copyright (C) 19yy <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) 19yy name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.
```

The hypothetical commands ``show w'` and ``show c'` should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than ``show w'` and ``show c'`; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the program
`Gnomovision' (which makes passes at compilers) written by James Hacker.
```

```
<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice
```

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

## 1.494 findutils 4.5.11-6.el7

### 1.494.1 Available under license :

GNU GENERAL PUBLIC LICENSE  
Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. <<http://fsf.org/>>  
Everyone is permitted to copy and distribute verbatim copies  
of this license document, but changing it is not allowed.

Preamble

The GNU General Public License is a free, copyleft license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains

in future versions  
of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.

## TERMS AND CONDITIONS

### 0. Definitions.

"This License" refers to version 3 of the GNU General Public License.

"Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

"The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you". "Licensees" and "recipients" may be individuals or organizations.

To

"modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

A "covered work" means either the unmodified Program or a work based on the Program.

To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To "convey" a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays "Appropriate

## Legal Notices"

to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

### 1. Source Code.

The "source code" for a work means the preferred form of the work for making modifications to it. "Object code" means any non-source form of a work.

A "Standard Interface" means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The "System Libraries" of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A "Major Component", in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The "Corresponding Source" for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding

Source.

The Corresponding Source for a work in source code form is that same work.

## 2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content,

constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

## 3. Protecting Users'

Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

#### 4. Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

#### 5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

- a) The work must carry prominent notices stating that you modified it, and giving a relevant date.
- b) The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to "keep intact all notices".
- c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.
- d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an "aggregate" if the compilation and

its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

#### 6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

c) Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge.

You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the

Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute

modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information

does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

## 7. Additional Terms.

"Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

- a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or
- b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or
- c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or

- d) Limiting the use for publicity purposes of names of licensors or authors of the material; or
- e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or
- f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered "further restrictions" within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

## 8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

#### 9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

#### 10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not

impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

#### 11. Patents.

A "contributor" is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's "contributor version".

A contributor's "essential patent claims" are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, "control" includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a "patent license" is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To "grant" such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. "Knowingly relying" means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that

country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is "discriminatory" if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

#### 12. No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

#### 13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed

under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

#### 14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

#### 15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

#### 16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

#### 17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

#### END OF TERMS AND CONDITIONS

#### How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively state the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>

Copyright (C) <year> <name of author>

This program is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 3 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License

along with this program. If not, see <<http://www.gnu.org/licenses/>>.

Also add information on how to contact you by electronic and paper mail.

If the program does terminal interaction, make it output a short notice like this when it starts in an interactive mode:

```
<program> Copyright (C) <year> <name of author>
This program comes with
ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.
```

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, your program's commands might be different; for a GUI interface, you would use an "about box".

You should also get your employer (if you work as a programmer) or school, if any, to sign a "copyright disclaimer" for the program, if necessary. For more information on this, and how to apply and follow the GNU GPL, see <<http://www.gnu.org/licenses/>>.

The GNU General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License. But first, please read <<http://www.gnu.org/philosophy/why-not-lgpl.html>>. @c The GNU Free Documentation License. @center Version 1.3, 3 November 2008

@c This file is intended to be included within another document, @c hence no sectioning command or @node.

@enumerate 0  
@item  
PREAMBLE

The purpose of this License is to make a manual, textbook, or other

functional and useful document @dfn{free} in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondly, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of ``copyleft'', which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

@item

#### APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The ``Document'', below, refers

to any such manual or work. Any member of the public is a licensee, and is addressed as ``you''. You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A ``Modified Version'' of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A ``Secondary Section'' is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political

position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

The "Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A "Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not "Transparent" is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means

the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

The "publisher" means any person or entity that distributes copies of the Document to the public.

A section "Entitled XYZ" means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as "Acknowledgements", "Dedications", "Endorsements", or "History".) To "Preserve the Title" of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

@item

#### VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

@item

#### COPYING IN QUANTITY

If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify

you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

@item

## MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

@enumerate A

@item

Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same

title as a previous version  
if the original publisher of that version gives permission.

@item

List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.

@item

State on the Title page the name of the publisher of the Modified Version, as the publisher.

@item

Preserve all the copyright notices of the Document.

@item

Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.

@item

Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.

@item

Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.

@item

Include an unaltered copy of this License.

@item

Preserve the section Entitled ``History'', Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled ``History'' in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.

@item

Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the ``History'' section.

You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.

@item

For any

section Entitled ``Acknowledgements" or ``Dedications", Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.

@item

Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.

@item

Delete any section Entitled ``Endorsements". Such a section may not be included in the Modified Version.

@item

Do not retitle any existing section to be Entitled ``Endorsements" or to conflict in title with any Invariant Section.

@item

Preserve any Warranty Disclaimers.

@end enumerate

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant

Sections in the Modified Version's license notice.

These titles must be distinct from any other section titles.

You may add a section Entitled ``Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties---for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or

by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

@item

## COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number.

Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections Entitled ``History" in the various original documents, forming one section Entitled ``History"; likewise combine any sections Entitled ``Acknowledgements", and any sections Entitled ``Dedications". You must delete all sections Entitled ``Endorsements."

@item

## COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License

into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

@item

## AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an ``aggregate" if the copyright resulting from the compilation is not used to limit the legal rights of the compilation's users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document's Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form.

Otherwise they must appear on printed covers that bracket the whole aggregate.

@item

## TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

If a section in the Document is Entitled ``Acknowledgements", ``Dedications", or ``History", the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

@item

## TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, or distribute it is void, and will automatically terminate your rights under this License.

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, receipt of a copy of some or all of the same material does not give you any rights to use it.

@item

#### FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See @uref{<http://www.gnu.org/copyleft/>}.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License ``or any later version'' applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation. If the Document specifies that a proxy can decide which future versions of this License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the

Document.

@item

RELICENSING

``Massive Multiauthor Collaboration Site" (or ``MMC Site") means any World Wide Web server that publishes copyrightable works and also provides prominent facilities for anybody to edit those works. A public wiki that anybody can edit is an example of such a server. A ``Massive Multiauthor Collaboration" (or ``MMC") contained in the site means any set of copyrightable works thus published on the MMC site.

``CC-BY-SA" means the Creative Commons

Attribution-Share Alike 3.0

license published by Creative Commons Corporation, a not-for-profit corporation with a principal place of business in San Francisco, California, as well as future copyleft versions of that license published by that same organization.

``Incorporate" means to publish or republish a Document, in whole or in part, as part of another Document.

An MMC is ``eligible for relicensing" if it is licensed under this License, and if all works that were first published under this License somewhere other than this MMC, and subsequently incorporated in whole or in part into the MMC, (1) had no cover texts or invariant sections, and (2) were thus incorporated prior to November 1, 2008.

The operator of an MMC Site may republish an MMC contained in the site under CC-BY-SA on the same site at any time before August 1, 2009, provided the MMC is eligible for relicensing.

@page

@heading ADDENDUM: How to use this License for your documents

To use this License

in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

@smallexample

@group

Copyright (C) @var{year} @var{your name}.

Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.3

or any later version published by the Free Software Foundation;  
with no Invariant Sections, no Front-Cover Texts, and no Back-Cover  
Texts. A copy of the license is included in the section entitled ``GNU  
Free Documentation License".

@end group

@end smallexample

If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts,  
replace the ``with@dots{ }Texts."@: line with this:

@smallexample

@group

with the Invariant Sections being @var{list their titles}, with  
the Front-Cover Texts being @var{list}, and with the Back-Cover Texts  
being @var{list}.

@end group

@end smallexample

If you have Invariant  
Sections without Cover Texts, or some other  
combination of the three, merge those two alternatives to suit the  
situation.

If your document contains nontrivial examples of program code, we  
recommend releasing these examples in parallel under your choice of  
free software license, such as the GNU General Public License,  
to permit their use in free software.

# 1.495 python-paramiko 2.1.1-9.el7

## 1.495.1 Available under license :

GNU LESSER GENERAL PUBLIC LICENSE

Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.

51 Franklin Street, Suite 500, Boston, MA 02110-1335 USA

Everyone is permitted to copy and distribute verbatim copies  
of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts  
as the successor of the GNU Library Public License, version 2, hence  
the version number 2.1.]

## Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

## GNU LESSER GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's

complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves,

then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based

on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or

linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License.

Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6.

Any

executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

- a) Accompany the work with the complete corresponding machine-readable

source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed

under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or

distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot

distribute

so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by

the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

#### NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

#### END OF TERMS AND CONDITIONS

##### How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively

convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the library's name and a brief idea of what it does.>  
Copyright (C) <year> <name of author>

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Suite 500, Boston, MA 02110-1335 USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library `Frob' (a library for tweaking knobs) written by James Random Hacker.

<signature of Ty Coon>, 1 April 1990  
Ty Coon, President of Vice

That's all there is to it!

### 1.496.1 Available under license :

GNU LESSER GENERAL PUBLIC LICENSE  
Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.  
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA  
Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

## Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is

modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and

is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the

reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in

non-free programs enables many more people to use the whole GNU

operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

#### GNU LESSER GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code"

for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from

such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) The modified work must itself be a software library.
- b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.
- c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.
- d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for

that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the

source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the

Library even though the source code is not.

Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work

during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

- a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)
- b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.
- c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.
- d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.
- e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided

that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library

subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein.

You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but

may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

#### NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

#### END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the library's name and a brief idea of what it does.>  
Copyright (C) <year> <name of author>

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library 'Frob' (a library for tweaking knobs) written by James Random Hacker.

<signature of Ty Coon>, 1 April 1990  
Ty Coon, President of Vice

That's all there is to it!

## 1.498.1 Available under license :

GNU LESSER GENERAL PUBLIC LICENSE

Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.  
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA  
Everyone is permitted to copy and distribute verbatim copies  
of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts  
as the successor of the GNU Library Public License, version 2, hence  
the version number 2.1.]

### Preamble

The licenses for most software are designed to take away your  
freedom to share and change it. By contrast, the GNU General Public  
Licenses are intended to guarantee your freedom to share and change  
free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some  
specially designated software  
packages--typically libraries--of the  
Free Software Foundation and other authors who decide to use it. You  
can use it too, but we suggest you first think carefully about whether  
this license or the ordinary General Public License is the better  
strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use,  
not price. Our General Public Licenses are designed to make sure that  
you have the freedom to distribute copies of free software (and charge  
for this service if you wish); that you receive source code or can get  
it if you want it; that you can change the software and use pieces of  
it in new free programs; and that you are informed that you can do  
these things.

To protect your rights, we need to make restrictions that forbid  
distributors to deny you these rights or to ask you to surrender these

rights. These restrictions translate to certain responsibilities for  
you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that

there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and

is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages

are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU

operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

## GNU LESSER GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the

Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code"

for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) The modified work must itself be a software library.
- b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.
- c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for

that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the

Library even though the source code is not.

Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

- a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)
- b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.
- c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library

subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

#### NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

#### END OF TERMS AND CONDITIONS

#### How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the library's name and a brief idea of what it does.>  
Copyright (C) <year> <name of author>

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library 'Frob' (a library for tweaking knobs) written by James Random Hacker.

<signature of Ty Coon>, 1 April 1990  
Ty Coon, President of Vice

That's all there is to it!

## 1.500.1 Available under license :

GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.,  
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies  
of this license document, but changing it is not allowed.

### Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Lesser General Public License instead.)

You can apply it to  
your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients  
all the rights that  
you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

## GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under

the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete

machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a

special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License.

However, parties who have received copies, or rights, from you under

this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that

system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author

to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

#### NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH

YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

#### END OF TERMS AND CONDITIONS

#### How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the program's name and a brief idea of what it does.>  
Copyright (C) <year> <name of author>
```

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type 'show w'.
This
is free software, and you are welcome to redistribute it
under certain conditions; type 'show c' for details.
```

The hypothetical commands 'show w' and 'show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the program
'Gnomovision' (which makes passes at compilers) written by James Hacker.
```

```
<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice
```

This General

Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License.

# 1.501 perl-socket 2.010-5.el7

## 1.501.1 Available under license :

GNU GENERAL PUBLIC LICENSE

Version 1, February 1989

Copyright (C) 1989 Free Software Foundation, Inc.

51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

### Preamble

The license agreements of most software companies try to keep users at the mercy of those companies. By contrast, our General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. The General Public License applies to the Free Software Foundation's software and to any other program whose authors commit to using it. You can use it for your programs, too.

When we speak of free software, we are referring to freedom, not price. Specifically, the General Public License is designed to make sure that you have the freedom to give away or sell copies of free software, that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free

programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of a such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must tell them their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

The precise terms and conditions for copying, distribution and modification follow.

## GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any work containing the Program or a portion of it, either verbatim or with modifications. Each licensee is addressed as "you".

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this General Public License and to the absence of any warranty; and give any other recipients of the Program a copy of this General Public License along with the Program. You may charge a fee for the physical act of transferring a copy.

2. You may modify your copy or copies of the Program or any portion of it, and copy and distribute such modifications under the terms of Paragraph 1 above, provided that you also do the following:

a) cause the modified files to carry prominent notices stating that you changed the files and the date of any change; and

b) cause the whole of any work that you distribute or publish, that in whole or in part contains the Program or any part thereof, either with or without modifications, to be licensed at no charge to all third parties under the terms of this General Public License (except that you may choose to grant warranty protection to some or all third parties, at your option).

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the simplest and most usual way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this General Public License.

d) You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

Mere aggregation of another independent work with the Program (or its derivative) on a volume of a storage or distribution medium does not bring the other work under the scope of these terms.

3. You may copy and distribute the Program (or a portion or derivative of it, under Paragraph 2) in object code or executable form under the terms of Paragraphs 1 and 2 above provided that you also do one of the following:

a) accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Paragraphs 1 and 2 above; or,

b) accompany it with a written offer, valid for at least three years, to give any third party free (except for a nominal charge for the cost of distribution) a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Paragraphs 1 and 2 above; or,

c) accompany it with the information you received as to where the

corresponding source code may be obtained. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form alone.)

Source code for a work means the preferred form of the work for making modifications to it. For an executable file, complete source code means all the source code for all modules it contains; but, as a special exception, it need not include source code for modules which are standard libraries that accompany the operating system on which the executable file runs, or for standard header files or definitions files that accompany that operating system.

4. You may not copy, modify, sublicense, distribute or transfer the Program except as expressly provided under this General Public License. Any attempt otherwise to copy, modify, sublicense, distribute or transfer the Program is void, and will automatically terminate your rights to use the Program under this License. However, parties who have received copies, or rights to use copies, from you under this General Public License will not have their licenses terminated so long as such parties remain in full compliance.

5. By copying, distributing or modifying the Program (or any work based on the Program) you indicate your acceptance of this license to do so, and all its terms and conditions.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein.

7. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of the license which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the license, you may choose any version ever published by the Free Software Foundation.

8. If you wish to incorporate parts of the Program into other free

programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

#### NO WARRANTY

9. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE

THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

10. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

#### END OF TERMS AND CONDITIONS

##### Appendix: How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to humanity, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>

Copyright (C) 19yy <name of author>

This program is free software; you can redistribute it and/or modify

it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 1, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) 19xx name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type 'show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type 'show c' for details.
```

The hypothetical commands 'show w' and 'show c' should show the appropriate parts of the General Public License.

Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the
program 'Gnomovision' (a program to direct compilers to make passes
at assemblers) written by James Hacker.
```

```
<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice
```

That's all there is to it!

## The "Artistic License"

### Preamble

The intent of this document is to state the conditions under which a Package may be copied, such that the Copyright Holder maintains some semblance of artistic control over the development of the package, while giving the users of the package the right to use and distribute the Package in a more-or-less customary fashion, plus the right to make reasonable modifications.

### Definitions:

"Package" refers to the collection of files distributed by the Copyright Holder, and derivatives of that collection of files created through textual modification.

"Standard Version" refers to such a Package if it has not been modified, or has been modified in accordance with the wishes of the Copyright Holder as specified below.

"Copyright Holder" is whoever is named in the copyright or copyrights for the package.

"You" is you, if you're thinking about copying or distributing this Package.

"Reasonable copying fee" is whatever you can justify on the basis of media cost, duplication charges, time of people involved, and so on. (You will not be required to justify it to the Copyright Holder, but only to the computing community at large as a market that must bear the fee.)

"Freely Available" means that no fee is charged for the item itself, though there may be fees involved in handling the item. It also means that recipients of the item may redistribute it under the same conditions they received it.

1. You may make and give away verbatim copies of the source form of the Standard Version of this Package without restriction, provided that you duplicate all of the original copyright notices and associated disclaimers.
2. You may apply bug fixes, portability fixes and other modifications derived from the Public Domain or from the Copyright Holder. A Package modified in such a way shall still be considered the Standard Version.
3. You may otherwise modify your copy of this Package in any way, provided

that you insert a prominent notice in each changed file stating how and when you changed that file, and provided that you do at least ONE of the following:

a) place your modifications in the Public Domain or otherwise make them Freely Available, such as by posting said modifications to Usenet or an equivalent medium, or placing the modifications on a major archive site such as uunet.uu.net, or by allowing the Copyright Holder to include your modifications in the Standard Version of the Package.

b) use the modified Package only within your corporation or organization.

c) rename any non-standard executables so the names do not conflict with standard executables, which must also be provided, and provide a separate manual page for each non-standard executable that clearly documents how it differs from the Standard Version.

d) make other distribution arrangements with the Copyright Holder.

4. You may distribute the programs of this Package in object code or executable form, provided that you do at least ONE of the following:

a) distribute a Standard Version of the executables and library files, together with instructions (in the manual page or equivalent) on where to get the Standard Version.

b) accompany the distribution with the machine-readable source of the Package with your modifications.

c) give non-standard executables non-standard names, and clearly document the differences in manual pages (or equivalent), together with instructions on where to get the Standard Version.

d) make other distribution arrangements with the Copyright Holder.

5. You may charge a reasonable copying fee for any distribution of this Package. You may charge any fee you choose for support of this Package. You may not charge a fee for this Package itself. However, you may distribute this Package in aggregate with other (possibly commercial) programs as part of a larger (possibly commercial) software distribution provided

that you do not advertise this Package as a product of your own. You may embed this Package's interpreter within an executable of yours (by linking); this shall be construed as a mere form of aggregation, provided that the complete Standard Version of the interpreter is so embedded.

6. The scripts and library files supplied as input to or produced as output from the programs of this Package do not automatically fall under the copyright of this Package, but belong to whoever generated them, and may be sold commercially, and may be aggregated with this Package. If such scripts or library files are aggregated with this Package via the so-called "undump" or "unexec" methods of producing a binary executable image, then distribution of such an image shall neither be construed as a distribution of this Package nor shall it fall under the restrictions of Paragraphs 3 and 4, provided that you do not represent such an executable image as a Standard Version of this Package.

7. C subroutines

(or comparably compiled subroutines in other languages) supplied by you and linked into this Package in order to emulate subroutines and variables of the language defined by this Package shall not be considered part of this Package, but are the equivalent of input as in Paragraph 6, provided these subroutines do not change the language in any way that would cause it to fail the regression tests for the language.

8. Aggregation of this Package with a commercial distribution is always permitted provided that the use of this Package is embedded; that is, when no overt attempt is made to make this Package's interfaces visible to the end user of the commercial distribution. Such use shall not be construed as a distribution of this Package.

9. The name of the Copyright Holder may not be used to endorse or promote products derived from this software without specific prior written permission.

10. THIS PACKAGE IS PROVIDED "AS IS" AND WITHOUT ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

The End

This code was extracted from the Perl 5 core at perl 5.15.5.

The original licence reads as follows:

This program is free software; you can redistribute it and/or modify it under the terms of either:

- a) the GNU General Public License as published by the Free Software Foundation; either version 1, or (at your option) any later version, or

b) the "Artistic License" which comes with this Kit.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See either the GNU General Public License or the Artistic License for more details.

You should have received a copy of the Artistic License with this Kit, in the file named "Artistic". If not, I'll be glad to provide one.

You should also have received a copy of the GNU General Public License along with this program in the file named "Copying". If not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA or visit their web page on the internet at <http://www.gnu.org/copyleft/gpl.html>.

## 1.502 iprutils 2.4.17.1-3.el7\_7

### 1.502.1 Available under license :

Common Public License Version 1.0

THE ACCOMPANYING PROGRAM IS PROVIDED UNDER THE TERMS OF THIS COMMON PUBLIC LICENSE ("AGREEMENT"). ANY USE, REPRODUCTION OR DISTRIBUTION OF THE PROGRAM CONSTITUTES RECIPIENT'S ACCEPTANCE OF THIS AGREEMENT.

#### 1. DEFINITIONS

"Contribution" means:

a) in the case of the initial Contributor, the initial code and documentation distributed under this Agreement, and

b) in the case of each subsequent Contributor:

i) changes to the Program, and

ii) additions to the Program;

where such changes and/or additions to the Program originate from and are distributed by that particular Contributor. A Contribution 'originates' from a Contributor if it was added to the Program by such Contributor itself or anyone acting on such Contributor's behalf. Contributions do not include additions to the Program which: (i) are separate modules of software distributed in conjunction with the Program under their own license agreement, and (ii) are not derivative works of the Program.

"Contributor"

means any person or entity that distributes the Program.

"Licensed Patents " mean patent claims licensable by a Contributor which are necessarily infringed by the use or sale of its Contribution alone or when combined with the Program.

"Program" means the Contributions distributed in accordance with this Agreement.

"Recipient" means anyone who receives the Program under this Agreement, including all Contributors.

## 2. GRANT OF RIGHTS

a) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free copyright license to reproduce, prepare derivative works of, publicly display, publicly perform, distribute and sublicense the Contribution of such Contributor, if any, and such derivative works, in source code and object code form.

b) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free patent license under Licensed Patents to make, use, sell, offer to sell, import and otherwise transfer the Contribution of such Contributor, if any, in source code and object code form. This patent license shall apply to the combination of the Contribution and the Program if, at the time the Contribution is added by the Contributor, such addition of the Contribution causes such combination to be covered by the Licensed Patents. The patent license shall not apply to any other combinations which include the Contribution. No hardware per se is licensed hereunder.

c) Recipient understands that although each Contributor grants the licenses to its Contributions set forth herein, no assurances are provided by any Contributor that the Program does not infringe the patent or other intellectual property rights of any other entity. Each Contributor disclaims any liability to Recipient for claims brought by any other entity based on infringement of intellectual property rights or otherwise. As a condition to exercising the rights and licenses granted hereunder, each Recipient hereby assumes sole responsibility to secure any other intellectual property rights needed, if any. For example, if a third party patent license is required to allow Recipient to distribute the Program, it is Recipient's responsibility to acquire that license before distributing the Program.

d) Each Contributor represents that to its knowledge it has sufficient copyright rights in its Contribution, if any, to grant the copyright license set forth

in this Agreement.

### 3. REQUIREMENTS

A Contributor may choose to distribute the Program in object code form under its own license agreement, provided that:

- a) it complies with the terms and conditions of this Agreement; and
- b) its license agreement:
  - i) effectively disclaims on behalf of all Contributors all warranties and conditions, express and implied, including warranties or conditions of title and non-infringement, and implied warranties or conditions of merchantability and fitness for a particular purpose;
  - ii) effectively excludes on behalf of all Contributors all liability for damages, including direct, indirect, special, incidental and consequential damages such as lost profits;
  - iii) states that any provisions which differ from this Agreement are offered by that Contributor alone and not by any other party; and
  - iv) states that source code for the Program is available from such Contributor, and informs licensees how to obtain it in a reasonable manner on or through a medium customarily used for software exchange.

When the Program is made available in source code form:

- a) it must be made available under this Agreement; and
- b) a copy of this Agreement must be included with each copy of the Program.

Contributors may not remove or alter any copyright notices contained within the Program.

Each Contributor must identify itself as the originator of its Contribution, if any, in a manner that reasonably allows subsequent Recipients to identify the originator of the Contribution.

### 4. COMMERCIAL DISTRIBUTION

Commercial distributors of software may accept certain responsibilities with respect to end users, business partners and the like. While this license is intended to facilitate the commercial use of the Program, the Contributor who includes the Program in a commercial product offering should do so in a manner

which does not create potential liability for other Contributors. Therefore, if a Contributor includes the Program in a commercial product offering, such Contributor ("Commercial Contributor") hereby agrees to defend and indemnify every other Contributor ("Indemnified Contributor") against any losses, damages and costs (collectively "Losses") arising from claims, lawsuits and other legal actions brought by a third party against the Indemnified Contributor to the extent caused by the acts or omissions of such Commercial Contributor in connection with its distribution of the Program in a commercial product offering. The obligations in this section do not apply to any claims or Losses relating to any actual or alleged intellectual property infringement. In order to qualify, an Indemnified Contributor must:

- a) promptly notify the Commercial Contributor in writing of such claim, and
- b) allow the Commercial Contributor to control, and cooperate with the Commercial Contributor in, the defense and any related settlement negotiations. The Indemnified Contributor may participate in any such claim at its own expense.

For example, a Contributor might include the Program in a commercial product offering, Product X. That Contributor is then a Commercial Contributor. If that Commercial Contributor then makes performance claims, or offers warranties related to Product X, those performance claims and warranties are such Commercial Contributor's responsibility alone. Under this section, the Commercial Contributor would have to defend claims against the other Contributors related to those performance claims and warranties, and if a court requires any other Contributor to pay any damages as a result, the Commercial Contributor must pay those damages.

## 5. NO WARRANTY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, THE PROGRAM IS PROVIDED ON AN "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, EITHER EXPRESS OR IMPLIED INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OR CONDITIONS OF TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Each Recipient is solely responsible for determining the appropriateness of using and distributing the Program and assumes all risks associated with its exercise of rights under this Agreement, including but not limited to the risks and costs of program errors, compliance with applicable laws, damage to or loss of data, programs or equipment, and unavailability or interruption of operations.

## 6. DISCLAIMER OF LIABILITY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, NEITHER RECIPIENT NOR ANY CONTRIBUTORS SHALL HAVE ANY LIABILITY FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING WITHOUT LIMITATION

LOST PROFITS), HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OR DISTRIBUTION OF THE PROGRAM OR THE EXERCISE OF ANY RIGHTS GRANTED HEREUNDER, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

## 7. GENERAL

If any provision of this Agreement is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this Agreement, and without further action by the parties hereto, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

If Recipient institutes patent litigation against a Contributor with respect to a patent applicable to software (including a cross-claim or counterclaim in a lawsuit), then any patent licenses granted by that Contributor to such Recipient under this Agreement shall terminate as of the date such litigation is filed. In addition, if Recipient institutes patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Program itself (excluding combinations of the Program with other software or hardware) infringes such Recipient's patent(s), then such Recipient's rights granted under Section 2(b) shall terminate as of the date such litigation is filed.

All Recipient's rights under this Agreement shall terminate if it fails to comply with any of the material terms or conditions of this Agreement and does not cure such failure in a reasonable period of time after becoming aware of such noncompliance. If all Recipient's rights under this Agreement terminate, Recipient agrees to cease use and distribution of the Program as soon as reasonably practicable. However, Recipient's obligations under this Agreement and any licenses granted by Recipient relating to the Program shall continue and survive.

Everyone is permitted to copy and distribute copies of this Agreement, but in order to avoid inconsistency the Agreement is copyrighted and may only be modified in the following manner. The Agreement Steward reserves the right to publish new versions (including revisions) of this Agreement from time to time. No one other than the Agreement Steward has the right to modify this Agreement. IBM is the initial Agreement Steward. IBM may assign the responsibility to serve as the Agreement Steward to a suitable separate entity. Each new version of the Agreement will be given a distinguishing version number. The Program (including Contributions) may always be distributed subject to the version of the Agreement under which it was received. In addition, after a new version of the Agreement is published, Contributor may elect to distribute the Program (including its Contributions)

under the

new version. Except as expressly stated in Sections 2(a) and 2(b) above, Recipient receives no rights or licenses to the intellectual property of any Contributor under this Agreement, whether expressly, by implication, estoppel or otherwise. All rights in the Program not expressly granted under this Agreement are reserved.

This Agreement is governed by the laws of the State of New York and the intellectual property laws of the United States of America. No party to this Agreement will bring a legal action under this Agreement more than one year after the cause of action arose. Each party waives its rights to a jury trial in any resulting litigation.

### 1.503.1 Available under license :

GNU LIBRARY GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1991 Free Software Foundation, Inc.

59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the library GPL. It is numbered 2 because it goes with version 2 of the ordinary GPL.]

#### Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Library General Public License, applies to some specially designated Free Software Foundation software, and to any other libraries whose authors decide to use it. You can use it for your libraries, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library, or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link a program with the library, you must provide complete object files to the recipients so that they can relink them with the library, after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

Our method of protecting your rights has two steps: (1) copyright the library, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the library.

Also, for each distributor's protection, we want to make certain that everyone understands that there is no warranty for this free library. If the library is modified by someone else and passed on, we want its recipients to know that what they have is not the original version, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that companies distributing free software will individually obtain patent licenses, thus in effect transforming the program into proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which was designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don't assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without changing the library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better.

However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, while the latter only works together with the library.

Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

## GNU LIBRARY GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of

its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also compile or

link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

c) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

d) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the

executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein.

You are not responsible for enforcing compliance by third parties to this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not

distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system;

it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Library General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or

concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

#### NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the library's name and a brief idea of what it does.>  
Copyright (C) <year>  
<name of author>
```

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Library General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Library General Public License for more details.

=head1 EXAMPLE

This is an example showing how you can extract links from a document received using LWP:

```
use LWP::UserAgent;
use HTML::LinkExtor;
use URI::URL;

$url = "http://www.perl.org/"; # for instance
$sua = LWP::UserAgent->new;

# Set up a callback that collect image links
my @imgs = ();
sub callback {
    my($tag, %attr) = @_ ;
    return if $tag ne 'img'; # we only look closer at <img ...>
    push(@imgs, values %attr);
}

# Make the parser. Unfortunately, we don't know the base yet
# (it might be different from $url)
$p = HTML::LinkExtor->new(\&callback);
```

```
# Request document and parse it as it arrives
$res = $ua->request(HTTP::Request->new(GET => $url),
    sub { $p->parse($_[0])});
```

```
# Expand all image URLs to absolute ones
my $base = $res->base;
@imgs = map { $_ = url($_, $base)->abs; } @imgs;
```

```
# Print them out
print join("\n", @imgs), "\n";
```

```

=head1 NAME
```

HTML::Parser - HTML parser class

```
=head1 SYNOPSIS
```

```
use HTML::Parser ();
```

```
# Create parser object
$p = HTML::Parser->new( api_version => 3,
    start_h => [ \&start, "tagname", attr"],
    end_h   => [ \&end, "tagname"],
    marked_sections => 1,
);
```

```
# Parse document text chunk by chunk
$p->parse($chunk1);
$p->parse($chunk2);
#...
$p->eof;          # signal end of document
```

```
# Parse directly from file
$p->parse_file("foo.html");
# or
open(my $fh, "<:utf8", "foo.html") || die;
$p->parse_file($fh);
```

=head1 DESCRIPTION

Objects of the C<HTML::Parser> class will recognize markup and separate it from plain text (alias data content) in HTML documents. As different kinds of markup and text are recognized, the corresponding event handlers are invoked.

C<HTML::Parser> is not a generic SGML parser. We have tried to make it able to deal with the HTML that is actually "out there", and it normally parses as closely as possible to the way the popular web browsers do it instead of strictly following one of the many HTML specifications from W3C. Where there is disagreement, there is often an option that you can enable to get the official behaviour.

The document to be parsed may be supplied in arbitrary chunks. This makes on-the-fly parsing as documents are received from the network possible.

If event driven parsing does not feel right for your application, you might want to use C<HTML::PullParser>. This is an C<HTML::Parser> subclass that allows a more conventional program structure.

=head1 METHODS

The following method is used to construct a new C<HTML::Parser> object:

=over

```
=item $p = HTML::Parser->new( %options_and_handlers )
```

This class method creates a new C<HTML::Parser> object and returns it. Key/value argument pairs may be provided to assign event

handlers or initialize parser options. The handlers and parser options can also be set or modified later by the method calls described below.

If a top level key is in the form "<event>\_h" (e.g., "text\_h") then it assigns a handler to that event, otherwise it initializes a parser option. The event handler specification value must be an array reference. Multiple handlers may also be assigned with the 'handlers => [%handlers]' option. See examples below.

If new() is called without any arguments, it will create a parser that uses callback methods compatible with version 2 of C<HTML::Parser>. See the section on "version 2 compatibility" below for details.

The special constructor option 'api\_version => 2' can be used to initialize version 2 callbacks while still setting other options and handlers. The 'api\_version => 3' option can be used if you don't want to set any options and don't want to fall back to v2 compatible mode.

Examples:

```
$p = HTML::Parser->new(api_version => 3,  
                      text_h => [ sub { ... }, "dtext" ] );
```

This creates a new parser object with a text event handler subroutine that receives the original text with general entities decoded.

```
$p = HTML::Parser->new(api_version => 3,  
                      start_h => [ 'my_start', "self,tokens" ] );
```

This creates a new parser object with a start event handler method that receives the \$p and the tokens array.

```
$p = HTML::Parser->new(api_version => 3,  
                      handlers => { text => [ \@array, "event,text" ],  
                                    comment => [ \@array, "event,text" ],  
                      });
```

This creates a new parser object that stores the event type and the original text in @array for text and comment events.

=back

The following methods feed the HTML document to the C<HTML::Parser> object:

=over

=item `$p->parse( $string )`

Parse `$string` as the next chunk of the HTML document. Handlers invoked should not attempt to modify the `$string` in-place until `$p->parse` returns.

If an invoked event handler aborts parsing by calling `$p->eof`, then `$p->parse()` will return a `FALSE` value. Otherwise the return value is a reference to the parser object (`$p`).

=item `$p->parse( $code_ref )`

If a code reference is passed as the argument to be parsed, then the chunks to be parsed are obtained by invoking this function repeatedly. Parsing continues until the function returns an empty (or undefined) result. When this happens `$p->eof` is automatically signaled.

Parsing will also abort if one of the event handlers calls `$p->eof`.

The effect of this is the same as:

```
while (1) {
    my $chunk = &$code_ref();
    if (!defined($chunk) || !length($chunk)) {
        $p->eof;
        return $p;
    }
    $p->parse($chunk) || return undef;
}
```

But it is more efficient as this loop runs internally in XS code.

=item `$p->parse_file( $file )`

Parse text directly from a file. The `$file` argument can be a filename, an open file handle, or a reference to an open file handle.

If `$file` contains a filename and the file can't be opened, then the method returns an undefined value and `#!` tells why it failed. Otherwise the return value is a reference to the parser object.

If a file handle is passed as the `$file` argument, then the file will normally be read until EOF, but not closed.

If an invoked event handler aborts parsing by calling `$p->eof`,

then `$p->parse_file()` may not have read the entire file.

On systems with multi-byte line terminators, the values passed for the offset and length argspecs may be too low if `parse_file()` is called on a file handle that is not in binary mode.

If a filename is passed in, then `parse_file()` will open the file in binary mode.

=item `$p->eof`

Signals the end of the HTML document. Calling the `$p->eof` method outside a handler callback will flush any remaining buffered text (which triggers the `C<text>` event if there is any remaining text).

Calling `$p->eof` inside a handler will terminate parsing at that point and cause `$p->parse` to return a `FALSE` value. This also terminates parsing by `$p->parse_file()`.

After `$p->eof` has been called, the `parse()` and `parse_file()` methods can be invoked to feed new documents with the parser object.

The return value from `eof()` is a reference to the parser object.

=back

Most parser options are controlled by boolean attributes. Each boolean attribute is enabled by calling the corresponding method with a `TRUE` argument and disabled with a `FALSE` argument. The attribute value is left unchanged if no argument is given. The return value from each method is the old attribute value.

Methods that can be used to get and/or set parser options are:

=over

=item `$p->attr_encoded`

=item `$p->attr_encoded( $bool )`

By default, the `C<attr>` and `C<@attr>` argspecs will have general entities for attribute values decoded. Enabling this attribute leaves entities alone.

=item `$p->backquote`

=item \$p->backquote( \$bool )

By default,

only ' and " are recognized as quote characters around attribute values. MSIE also recognizes backquotes for some reason. Enabling this attribute provides compatibility with this behaviour.

=item \$p->boolean\_attribute\_value( \$val )

This method sets the value reported for boolean attributes inside HTML start tags. By default, the name of the attribute is also used as its value. This affects the values reported for C<tokens> and C<attr> argspecs.

=item \$p->case\_sensitive

=item \$p->case\_sensitive( \$bool )

By default, tagnames and attribute names are down-cased. Enabling this attribute leaves them as found in the HTML source document.

=item \$p->closing\_plaintext

=item \$p->closing\_plaintext( \$bool )

By default, "plaintext" element can never be closed. Everything up to the end of the document is parsed in CDATA mode. This historical behaviour is what at least MSIE does. Enabling this attribute makes closing "</plaintext>" tag effective and the parsing process will resume after seeing this tag. This emulates early gecko-based browsers.

=item \$p->empty\_element\_tags

=item \$p->empty\_element\_tags( \$bool )

By default, empty element tags are not recognized as such and the "/" before ">" is just treated like a normal name character (unless C<strict\_names> is enabled). Enabling this attribute make C<HTML::Parser> recognize these tags.

Empty element tags look like start tags, but end with the character sequence ">" instead of ">". When recognized by C<HTML::Parser> they cause an artificial end event in addition to the start event. The C<text> for the artificial end event will be empty and the C<tokenpos> array will be undefined even though the the token array will have one element containing the tag name.

=item \$p->marked\_sections

=item \$p->marked\_sections( \$bool )

By default, section markings like `<![CDATA[...]]>` are treated like ordinary text. When this attribute is enabled section markings are honoured.

There are currently no events associated with the marked section markup, but the text can be returned as `C<skipped_text>`.

=item \$p->strict\_comment

=item \$p->strict\_comment( \$bool )

By default, comments are terminated by the first occurrence of `-->`. This is the behaviour of most popular browsers (like Mozilla, Opera and MSIE), but it is not correct according to the official HTML standard. Officially, you need an even number of `--` tokens before the closing `>` is recognized and there may not be anything but whitespace between an even and an odd `--`.

The official behaviour is enabled by enabling this attribute.

Enabling of 'strict\_comment' also disables recognizing these forms as comments:

```
</ comment>
```

```
<! comment>
```

=item \$p->strict\_end

=item \$p->strict\_end( \$bool )

By default, attributes and other junk are allowed to be present on end tags in a manner that emulates MSIE's behaviour.

The official behaviour is enabled with this attribute. If enabled, only whitespace is allowed between the tagname and the final `>`.

=item

\$p->strict\_names

=item \$p->strict\_names( \$bool )

By default, almost anything is allowed in tag and attribute names.

This is the behaviour of most popular browsers and allows us to parse some broken tags with invalid attribute values like:

```
<IMG SRC=newprevlstGr.gif ALT=[PREV LIST] BORDER=0>
```

By default, "LIST]" is parsed as a boolean attribute, not as part of the ALT value as was clearly intended. This is also what Mozilla sees.

The official behaviour is enabled by enabling this attribute. If enabled, it will cause the tag above to be reported as text since "LIST]" is not a legal attribute name.

```
=item $p->unbroken_text
```

```
=item $p->unbroken_text( $bool )
```

By default, blocks of text are given to the text handler as soon as possible (but the parser takes care always to break text at a boundary between whitespace and non-whitespace so single words and entities can always be decoded safely). This might create breaks that make it hard to do transformations on the text. When this attribute is enabled, blocks of text are always reported in one piece. This will delay the text event until the following (non-text) event has been recognized by the parser.

Note that the C<offset> argspec will give you the offset of the first segment of text and C<length> is the combined length of the segments. Since there might be ignored tags in between, these numbers can't be used to directly index in the original document file.

```
=item $p->utf8_mode
```

```
=item $p->utf8_mode( $bool )
```

Enable this option when parsing raw undecoded UTF-8. This tells the parser that the entities expanded for strings reported by C<attr>, C<@attr> and C<dtext> should be expanded as decoded UTF-8 so they end up compatible with the surrounding text.

If C<utf8\_mode> is enabled then it is an error to pass strings containing characters with code above 255 to the parse() method, and the parse() method will croak if you try.

Example: The Unicode character "\x{2665}" is "\xE2\x99\xA5" when UTF-8 encoded. The

character can also be represented by the entity  
"&hearts;" or "&#x2665". If we feed the parser:

```
$p->parse("\xE2\x99\xA5&hearts;");
```

then `C<dtex>` will be reported as `"\xE2\x99\xA5{x{2665}"` without  
`C<utf8_mode>` enabled, but as `"\xE2\x99\xA5\xE2\x99\xA5"` when enabled.  
The later string is what you want.

This option is only available with perl-5.8 or better.

```
=item $p->xml_mode
```

```
=item $p->xml_mode( $bool )
```

Enabling this attribute changes the parser to allow some XML  
constructs. This enables the behaviour controlled by individually by  
the `C<case_sensitive>`, `C<empty_element_tags>`, `C<strict_names>` and  
`C<xml_pic>` attributes and also suppresses special treatment of  
elements that are parsed as CDATA for HTML.

```
=item $p->xml_pic
```

```
=item $p->xml_pic( $bool )
```

By default, `I<processing instructions>` are terminated by `">"`. When  
this attribute is enabled, processing instructions are terminated by  
`"?>"` instead.

```
=back
```

As markup and text is recognized, handlers are invoked. The following  
method

is used to set up handlers for different events:

```
=over
```

```
=item $p->handler( event => \&subroutine, $argspec )
```

```
=item $p->handler( event => $method_name, $argspec )
```

```
=item $p->handler( event => \@accum, $argspec )
```

```
=item $p->handler( event => "" );
```

```
=item $p->handler( event => undef );
```

```
=item $p->handler( event );
```

This method assigns a subroutine, method, or array to handle an event.

Event is one of C<text>, C<start>, C<end>, C<declaration>, C<comment>, C<process>, C<start\_document>, C<end\_document> or C<default>.

The C<\&subroutine> is a reference to a subroutine which is called to handle the event.

The C<\$method\_name> is the name of a method of \$p which is called to handle the event.

The C<@accum> is an array that will hold the event information as sub-arrays.

If the second argument is "", the event is ignored.  
If it is undef, the default handler is invoked for the event.

The C<\$argspec> is a string that describes the information to be reported for the event. Any requested information that does not apply to a specific event is passed as C<undef>. If argspec is omitted, then it is left unchanged.

The return value from \$p->handler is the old callback routine or a reference to the accumulator array.

Any return values from handler callback routines/methods are always ignored. A handler callback can request parsing to be aborted by invoking the \$p->eof method. A handler callback is not allowed to invoke the \$p->parse() or \$p->parse\_file() method. An exception will be raised if it tries.

Examples:

```
$p->handler(start => "start", 'self, attr, attrseq, text');
```

This causes the "start" method of object \$p to be called for 'start' events. The callback signature is \$p->start(\%attr, \@attr\_seq, \$text).

```
$p->handler(start => \&start, 'attr, attrseq, text');
```

This causes subroutine start() to be called for 'start' events. The callback signature is start(\%attr, \@attr\_seq, \$text).

```
$p->handler(start => \@accum, "S", attr, attrseq, text');
```

This

causes 'start' event information to be saved in @accum.  
The array elements will be ['S', \%attr, \@attr\_seq, \$text].

```
$p->handler(start => "");
```

This causes 'start' events to be ignored. It also suppresses invocations of any default handler for start events. It is in most cases equivalent to `$p->handler(start => sub { })`, but is more efficient. It is different from the empty-sub-handler in that `C<skipped_text>` is not reset by it.

```
$p->handler(start => undef);
```

This causes no handler to be associated with start events. If there is a default handler it will be invoked.

=back

Filters based on tags can be set up to limit the number of events reported. The main bottleneck during parsing is often the huge number of callbacks made from the parser. Applying filters can improve performance significantly.

The following methods control filters:

=over

```
=item $p->ignore_elements( @tags )
```

Both the `C<start>` event and the `C<end>` event as well as any events that would be reported in between are suppressed. The ignored elements can contain nested occurrences of itself. Example:

```
$p->ignore_elements(qw(script style));
```

The `C<script>` and `C<style>` tags will always nest properly since their content is parsed in CDATA mode. For most other tags `C<ignore_elements>` must be used with caution since HTML is often not I<well formed>.

```
=item $p->ignore_tags( @tags )
```

Any `C<start>` and `C<end>` events involving any of the tags given are suppressed. To reset the filter (i.e. don't suppress any `C<start>` and `C<end>` events), call `C<ignore_tags>` without an argument.

```
=item $p->report_tags( @tags )
```

Any C<start> and C<end> events involving any of the tags I<not> given are suppressed. To reset the filter (i.e. report all C<start> and C<end> events), call C<report\_tags> without an argument.

=back

Internally, the system has two filter lists, one for C<report\_tags> and one for C<ignore\_tags>, and both filters are applied. This effectively gives C<ignore\_tags> precedence over C<report\_tags>.

Examples:

```
$p->ignore_tags(qw(style));  
$p->report_tags(qw(script style));
```

results in only C<script> events being reported.

=head2 Argspec

Argspec is a string containing a comma-separated list that describes the information reported by the event. The following argspec identifier names can be used:

=over

=item C<attr>

Attr causes a reference to a hash of attribute name/value pairs to be passed.

Boolean attributes' values are either the value set by \$p->boolean\_attribute\_value, or the attribute name if no value has been set by \$p->boolean\_attribute\_value.

This passes undef except for C<start> events.

Unless C<xml\_mode> or C<case\_sensitive> is enabled, the attribute names are forced to lower case.

General entities are decoded in the attribute values and one layer of matching quotes enclosing the attribute values is removed.

The Unicode character set is assumed for entity decoding.

=item C<@attr>

Basically the same as C<attr>, but keys and values are passed as

individual

arguments and the original sequence of the attributes is kept. The parameters passed will be the same as the @attr calculated here:

```
@attr = map { $_ => $attr->{$_} } @Attrseq;
```

assuming \$attr and \$Attrseq here are the hash and array passed as the result of C<attr> and C<attrseq> argspecs.

This passes no values for events besides C<start>.

=item C<attrseq>

Attrseq causes a reference to an array of attribute names to be passed. This can be useful if you want to walk the C<attr> hash in the original sequence.

This passes undef except for C<start> events.

Unless C<xml\_mode> or C<case\_sensitive> is enabled, the attribute names are forced to lower case.

=item C<column>

Column causes the column number of the start of the event to be passed. The first column on a line is 0.

=item C<dtext>

Dtext causes the decoded text to be passed. General entities are automatically decoded unless the event was inside a CDATA section or was between literal start and end tags (C<script>, C<style>, C<xmp>, C<iframe>, C<title>, C<textarea> and C<plaintext>).

The Unicode character set is assumed for entity decoding. With Perl version 5.6 or earlier only the Latin-1 range is supported, and entities for characters outside the range 0..255 are left unchanged.

This passes undef except for C<text> events.

=item C<event>

Event causes the event name to be passed.

The event name is one of C<text>, C<start>, C<end>, C<declaration>, C<comment>, C<process>, C<start\_document> or C<end\_document>.

=item C<is\_cdata>

Is\_cdata causes a TRUE value to be passed if the event is inside a CDATA section or between literal start and end tags (C<script>, C<style>, C<xmp>, C<iframe>, C<title>, C<textarea> and C<plaintext>).

if the flag is FALSE for a text event, then you should normally either use C<dtxt> or decode the entities yourself before the text is processed further.

=item C<length>

Length causes the number of bytes of the source text of the event to be passed.

=item C<line>

Line

causes the line number of the start of the event to be passed. The first line in the document is 1. Line counting doesn't start until at least one handler requests this value to be reported.

=item C<offset>

Offset causes the byte position in the HTML document of the start of the event to be passed. The first byte in the document has offset 0.

=item C<offset\_end>

Offset\_end causes the byte position in the HTML document of the end of the event to be passed. This is the same as C<offset> + C<length>.

=item C<self>

Self causes the current object to be passed to the handler. If the handler is a method, this must be the first element in the argspec.

An alternative to passing self as an argspec is to register closures that capture \$self by themselves as handlers. Unfortunately this creates circular references which prevent the HTML::Parser object from being garbage collected. Using the C<self> argspec avoids this problem.

=item C<skipped\_text>

Skipped\_text returns the

concatenated text of all the events that have been skipped since the last time an event was reported. Events might be skipped because no handler is registered for them or because some filter applies. Skipped text also includes marked section markup, since there are no events that can catch it.

If an C<"">-handler is registered for an event, then the text for this event is not included in C<skipped\_text>. Skipped text both before and after the C<"">-event is included in the next reported C<skipped\_text>.

=item C<tag>

Same as C<tagname>, but prefixed with "/" if it belongs to an C<end> event and "!" for a declaration. The C<tag> does not have any prefix for C<start> events, and is in this case identical to C<tagname>.

=item C<tagname>

This is the element name (or I<generic identifier> in SGML jargon) for start and end tags. Since HTML is case insensitive, this name is forced to lower case to ease string matching.

Since XML is case sensitive, the tagname case is not changed when C<xml\_mode> is enabled. The same happens if the C<case\_sensitive> attribute is set.

The declaration type of declaration elements is also passed as a tagname, even if that is a bit strange.

In fact, in the current implementation tagname is identical to C<token0> except that the name may be forced to lower case.

=item C<token0>

Token0 causes the original text of the first token string to be passed. This should always be the same as \$tokens->[0].

For C<declaration> events, this is the declaration type.

For C<start> and C<end> events, this is the tag name.

For C<process> and non-strict C<comment> events, this is everything inside the tag.

This passes undef if there are no tokens in the event.

=item C<tokenpos>

Tokenpos causes a reference to an array of token positions to be passed. For each string that appears in C<tokens>, this array contains two numbers. The first number is the offset of the start of the token in the original C<text> and the second number is the length of the token.

Boolean attributes in a C<start> event will have (0,0) for the attribute value offset and length.

This passes undef if there are no tokens in the event (e.g., C<text>) and for artificial C<end> events triggered by empty element tags.

If you are using these offsets and lengths to modify C<text>, you should either work from right to left, or be very careful to calculate the changes to the offsets.

=item C<tokens>

Tokens causes a reference to an array of token strings to be passed. The strings are exactly as they were found in the original text, no decoding or case changes are applied.

For C<declaration> events, the array contains each word, comment, and delimited string starting with the declaration type.

For C<comment> events, this contains each sub-comment. If \$p->strict\_comments is disabled, there will be only one sub-comment.

For C<start> events, this contains the original tag name followed by the attribute name/value pairs. The values of boolean attributes will be either the value set by \$p->boolean\_attribute\_value, or the attribute name if no value has been set by \$p->boolean\_attribute\_value.

For C<end> events, this contains the original tag name (always one token).

For C<process> events, this contains the process instructions (always one token).

This passes C<undef> for C<text> events.

=item C<text>

Text causes the source text (including markup element delimiters) to be passed.

=item C<undef>

Pass an undefined value. Useful as padding where the same handler routine is registered for multiple events.

=item C<'... '>

A literal string of 0 to 255 characters enclosed in single (') or double (") quotes is passed as entered.

=back

The whole argspec string can be wrapped up in C<'@{...}'> to signal that the resulting event array should be flattened. This only makes a difference if an array reference is used as the handler target.

Consider this example:

```
$p->handler(text => [], 'text');  
$p->handler(text => [], '@{text}');
```

With

two text events; C<"foo">, C<"bar">; then the first example will end up with [["foo"], ["bar"]] and the second with ["foo", "bar"] in the handler target array.

=head2 Events

Handlers for the following events can be registered:

=over

=item C<comment>

This event is triggered when a markup comment is recognized.

Example:

```
<!-- This is a comment -- -- So is this -->
```

=item C<declaration>

This event is triggered when a I<markup declaration> is recognized.

For typical HTML documents, the only declaration you are likely to find is <!DOCTYPE ...>.

Example:

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01//EN"
"http://www.w3.org/TR/html4/strict.dtd">
```

DTDs inside <!DOCTYPE ...> will confuse HTML::Parser.

=item C<default>

This event is triggered for events that do not have a specific handler. You can set up a handler for this event to catch stuff you did not want to catch explicitly.

=item C<end>

This event is triggered when an end tag is recognized.

Example:

```
</A>
```

=item  
C<end\_document>

This event is triggered when \$p->eof is called and after any remaining text is flushed. There is no document text associated with this event.

=item C<process>

This event is triggered when a processing instructions markup is recognized.

The format and content of processing instructions are system and application dependent.

Examples:

```
<? HTML processing instructions >  
<? XML processing instructions ?>
```

=item C<start>

This event is triggered when a start tag is recognized.

Example:

```
<A HREF="http://www.perl.com/">
```

=item C<start\_document>

This event is triggered before any other events for a new document. A handler for it can be used to initialize stuff. There is no document text associated with this event.

=item C<text>

This event is triggered when plain text (characters) is recognized. The text may contain multiple lines. A sequence of text may be broken between several text events unless `$p->unbroken_text` is enabled.

The parser will make sure that it does not break a word or a sequence of whitespace between two text events.

=back

=head2 Unicode

`C<HTML::Parser>` can parse Unicode strings when running under perl-5.8 or better. If Unicode is passed to `$p->parse()` then chunks of Unicode will be reported to the handlers. The offset and length argspecs will also report their position in terms of characters.

It is safe to parse raw undecoded UTF-8 if you either avoid decoding entities and make sure to not use `I<argspecs>` that do, or enable the `C<utf8_mode>` for the parser. Parsing of undecoded UTF-8 might be useful when parsing from a file where you need the reported offsets and lengths to match the byte offsets in the file.

If a filename is passed to `$p->parse_file()` then the file will be read in binary mode. This will be fine if the file contains only ASCII or Latin-1 characters. If the file contains UTF-8 encoded text then care must be taken when decoding entities as described in the previous paragraph, but better is to open the file with the UTF-8 layer so that it is decoded properly:

```
open(my $fh, "<:utf8", "index.html") || die "...: $!";
$p->parse_file($fh);
```

If the file contains text encoded in a charset besides ASCII, Latin-1 or UTF-8 then decoding will always be needed.

=head1 VERSION 2 COMPATIBILITY

When an `C<HTML::Parser>` object is constructed with no arguments, a set

of handlers is automatically provided that is compatible with the old HTML::Parser version 2 callback methods.

This is equivalent to the following method calls:

```
$p->handler(start => "start", "self, tagname, attr, attrseq, text");
$p->handler(end => "end", "self, tagname, text");
$p->handler(text => "text", "self, text, is_cdata");
$p->handler(process => "process", "self, token0, text");
$p->handler(comment =>
    sub {
        my($self, $tokens) = @_ ;
        for (@$tokens) {$self->comment($_)}},
    "self, tokens");
$p->handler(declaration =>
    sub {
        my $self = shift;
        $self->declaration(substr($_[0], 2, -1));},
    "self, text");
```

Setting up these handlers can also be requested with the "api\_version => 2" constructor option.

## =head1 SUBCLASSING

The C<HTML::Parser> class is subclassable. Parser objects are plain hashes and C<HTML::Parser> reserves only hash keys that start with "\_hparser". The parser state can be set up by invoking the init() method, which takes the same arguments as new().

## =head1 EXAMPLES

The first simple example shows how you might strip out comments from an HTML document. We achieve this by setting up a comment handler that does nothing and a default handler that will print out anything else:

```
use HTML::Parser;
HTML::Parser->new(default_h => [sub { print shift }, 'text'],
    comment_h => [""],
    )->parse_file(shift || die) || die $!;
```

An alternative implementation is:

```
use HTML::Parser;
HTML::Parser->new(end_document_h => [sub { print shift },
```

```
'skipped_text'],
  comment_h => [""],
)->parse_file(shift || die) || die $!;
```

This will in most cases be much more efficient since only a single callback will be made.

The next example prints out the text that is inside the <title> element of an HTML document. Here we start by setting up a start handler. When it sees the title start tag it enables a text handler that prints any text found and an end handler that will terminate parsing as soon as the title end tag is seen:

```
use HTML::Parser ();

sub start_handler
{
  return if shift ne "title";
  my $self = shift;
  $self->handler(text => sub { print shift }, "dtext");
  $self->handler(end => sub { shift->eof if shift eq "title"; },
    "tagname,self");
}

my $p = HTML::Parser->new(api_version => 3);
$p->handler( start => \&start_handler, "tagname,self");
$p->parse_file(shift || die) || die $!;
print "\n";
```

More examples are found in the [F<eg/>](#) directory of the [C<HTML-Parser>](#) distribution: the program [C<hrefsub>](#) shows how you can edit all links found in a document; the program [C<htextsub>](#) shows how to edit the text only; the program [C<hstrip>](#) shows how you can strip out certain tags/elements and/or attributes; and the program [C<htext>](#) show how to obtain the plain text, but not any script/style content.

You can browse the [F<eg/>](#) directory online from the [I<\[Browse\]>](#) link on the <http://search.cpan.org/~gaas/HTML-Parser/> page.

=head1 BUGS

The <style> and <script> sections do not end with the first "</", but need the complete corresponding end tag. The standard behaviour is not really practical.

When the [I<strict\\_comment>](#) option is enabled, we still recognize comments where there is something other than whitespace between even

and odd "--" markers.

Once `$p->boolean_attribute_value` has been set, there is no way to restore the default behaviour.

There is currently no way to get both quote characters into the same literal argspec.

Empty

tags, e.g. "`<>`" and "`</>`", are not recognized. SGML allows them to repeat the previous start tag or close the previous start tag respectively.

NET tags, e.g. "`code/.../`" are not recognized. This is SGML shorthand for "`<code>...</code>`".

Unclosed start or end tags, e.g. "`<tt<b>...</b</tt>`" are not recognized.

=head1 DIAGNOSTICS

The following messages may be produced by `HTML::Parser`. The notation in this listing is the same as used in `L<perldiag>`:

=over

=item Not a reference to a hash

(F) The object blessed into or subclassed from `HTML::Parser` is not a hash as required by the `HTML::Parser` methods.

=item Bad signature in parser state object at %p

(F) The `_hparser_xs_state` element does not refer to a valid state structure. Something must have changed the internal value stored in this hash element, or the memory has been overwritten.

=item `_hparser_xs_state` element is not a reference

(F) The `_hparser_xs_state` element has been destroyed.

=item Can't find '`_hparser_xs_state`' element in `HTML::Parser` hash

(F) The `_hparser_xs_state` element is missing from the parser hash. It was either deleted, or not created when the object was created.

=item API version %s not supported by `HTML::Parser` %s

(F) The constructor option 'api\_version' with an argument greater than or equal to 4 is reserved for future extensions.

=item Bad constructor option '%s'

(F) An unknown constructor option key was passed to the new() or init() methods.

=item Parse loop not allowed

(F) A handler invoked the parse() or parse\_file() method. This is not permitted.

=item marked sections not supported

(F) The \$p->marked\_sections() method was invoked in a HTML::Parser module that was compiled without support for marked sections.

=item Unknown boolean attribute (%d)

(F) Something is wrong with the internal logic that set up aliases for boolean attributes.

=item Only code or array references allowed as handler

(F) The second argument for \$p->handler must be either a subroutine reference,  
then name of a subroutine or method, or a reference to an array.

=item No handler for %s events

(F) The first argument to \$p->handler must be a valid event name; i.e. one of "start", "end", "text", "process", "declaration" or "comment".

=item Unrecognized identifier %s in argspec

(F) The identifier is not a known argspec name.  
Use one of the names mentioned in the argspec section above.

=item Literal string is longer than 255 chars in argspec

(F) The current implementation limits the length of literals in an argspec to 255 characters. Make the literal shorter.

=item Backslash reserved for literal string in argspec

(F) The backslash character "\" is not allowed in argspec literals. It is reserved to permit quoting inside a literal in a later version.

=item Unterminated literal string in argspec

(F) The terminating quote character for a literal was not found.

=item Bad argspec (%s)

(F) Only identifier names, literals, spaces and commas are allowed in argspecs.

=item

Missing comma separator in argspec

(F) Identifiers in an argspec must be separated with ",".

=item Parsing of undecoded UTF-8 will give garbage when decoding entities

(W) The first chunk parsed appears to contain undecoded UTF-8 and one or more argspecs that decode entities are used for the callback handlers.

The result of decoding will be a mix of encoded and decoded characters for any entities that expand to characters with code above 127. This is not a good thing.

The recommended solution is to apply Encode::decode\_utf8() on the data before feeding it to the \$p->parse(). For \$p->parse\_file() pass a file that has been opened in ":utf8" mode.

The alternative solution is to enable the C<utf8\_mode> and not decode before passing strings to \$p->parse(). The parser can process raw undecoded UTF-8 sanely if the C<utf8\_mode> is enabled, or if the "attr", "@attr" or "dtext" argspecs are avoided.

=item Parsing string decoded with wrong endianness

(W) The first character in the document is U+FFFE. This is not a legal Unicode character but a byte swapped BOM. The result of parsing will likely be garbage.

=item Parsing of undecoded UTF-32

(W) The parser found the Unicode UTF-32 BOM signature at the start of the document. The result of parsing will likely be garbage.

=item Parsing of undecoded UTF-16

(W) The parser found the Unicode UTF-16 BOM signature at the start of the document. The result of parsing will likely be garbage.

=head1 NAME

HTML::TokenParser - Alternative HTML::Parser interface

=head1 SYNOPSIS

```
require HTML::TokenParser;
```

```
$p = HTML::TokenParser->new("index.html") ||
```

```
    die "Can't open: $!";
```

```
$p->empty_element_tags(1); # configure its behaviour
```

```
while (my $token = $p->get_token) {
```

```
    #...
```

```
}
```

=head1 DESCRIPTION

The C<HTML::TokenParser> is an alternative interface to the C<HTML::Parser> class. It is an C<HTML::PullParser> subclass with a predeclared set of token types. If you wish the tokens to be reported differently you probably want to use the C<HTML::PullParser> directly.

The following methods are available:

=over 4

```
=item $p = HTML::TokeParser->new( $filename, %opt );
```

```
=item $p = HTML::TokeParser->new( $filehandle, %opt );
```

```
=item $p = HTML::TokeParser->new( \ $document, %opt );
```

The object constructor argument is either a file name, a file handle object, or the complete document to be parsed. Extra options can be provided as key/value pairs and are processed as documented by the base classes.

If the argument is a plain scalar, then it is taken as the name of a file to be opened and parsed. If the file can't be opened for reading, then the constructor will return C<undef> and \$! will tell you why it failed.

If the argument is a reference to a plain scalar, then this scalar is taken to be the literal document to parse. The value of this scalar should not be changed before all tokens have been extracted.

Otherwise the argument is taken to be some object that the C<HTML::TokeParser> can read() from when it needs more data. Typically it will be a filehandle of some kind. The stream will be read() until EOF, but not closed.

A newly constructed C<HTML::TokeParser> differ from its base classes by having the C<unbroken\_text> attribute enabled by default. See L<HTML::Parser> for a description of this and other attributes that influence how the document is parsed. It is often a good idea to enable C<empty\_element\_tags> behaviour.

Note that the parsing result will likely not be valid if raw undecoded UTF-8 is used as a source. When parsing UTF-8 encoded files turn on UTF-8 decoding:

```
open(my $fh, "<:utf8", "index.html") || die "Can't open 'index.html': $!";
my $p = HTML::TokeParser->new( $fh );
# ...
```

If a \$filename is passed to the constructor the file will be opened in raw mode and the parsing result will only be valid if its content is Latin-1 or pure ASCII.

If parsing from an UTF-8 encoded string buffer decode it first:

```
utf8::decode($document);  
my $p = HTML::TokeParser->new( \ $document );  
# ...
```

```
=item $p->get_token
```

This method will return the next I<token> found in the HTML document, or C<undef> at the end of the document. The token is returned as an array reference. The first element of the array will be a string denoting the type of this token: "S" for start tag, "E" for end tag, "T" for text, "C" for comment, "D" for declaration, and "PI" for process instructions. The rest of the token array depend on the type like this:

```
["S", $tag, $attr, $attrseq, $text]  
["E", $tag, $text]  
["T", $text, $is_data]  
["C", $text]  
["D", $text]  
["PI", $token0, $text]
```

where \$attr is a hash reference, \$attrseq is an array reference and the rest are plain scalars. The L<HTML::Parser/Argspec> explains the details.

```
=item $p->unget_token( @tokens )
```

If you find you have read too many tokens you can push them back, so that they are returned the next time \$p->get\_token is called.

```
=item $p->get_tag
```

```
=item $p->get_tag( @tags )
```

This method returns the next start or end tag (skipping any other tokens), or C<undef> if there are no more tags in the document. If one or more arguments are given, then we skip tokens until one of the specified tag types is found. For example:

```
$p->get_tag("font", "/font");
```

will find the next start or end tag for a font-element.

The tag information is returned as an array reference in the same form

as

for `$p->get_token` above, but the type code (first element) is missing. A start tag will be returned like this:

```
[$tag, $attr, $attrseq, $text]
```

The tagname of end tags are prefixed with `"/"`, i.e. end tag is returned like this:

```
["/$tag", $text]
```

```
=item $p->get_text
```

```
=item $p->get_text( @endtags )
```

This method returns all text found at the current position. It will return a zero length string if the next token is not text. Any entities will be converted to their corresponding character.

If one or more arguments are given, then we return all text occurring before the first of the specified tags found. For example:

```
$p->get_text("p", "br");
```

will return the text up to either a paragraph or linebreak element.

The text might span tags that should be `I<textified>`. This is controlled by the `$p->{textify}` attribute, which is a hash that defines how certain tags can be treated as text. If the name of a start tag matches a key in this hash then this tag is converted to text. The hash value is used to specify which tag attribute to obtain the text from. If this tag attribute is missing, then the upper case name of the tag enclosed in brackets is returned, e.g. `"[IMG]"`. The hash value can also be a subroutine reference. In this case the routine is called with the start tag token content as its argument and the return value is treated as the text.

The default `$p->{textify}` value is:

```
{img => "alt", applet => "alt" }
```

This means that `<IMG>` and `<APPLET>` tags are treated as text, and that the text to substitute can be found in the ALT attribute.

```
=item $p->get_trimmed_text
```

```
=item $p->get_trimmed_text( @endtags )
```

Same as `$p->get_text` above, but will collapse any sequences of white space to a single space character. Leading and trailing white space is removed.

```
=item $p->get_phrase
```

This will return all text found at the current position ignoring any phrasal-level tags. Text is extracted until the first non phrasal-level tag. Textification of tags is the same as for `get_text()`. This method will collapse white space in the same way as `get_trimmed_text()` does.

The definition of `<i>phrasal-level tags</i>` is obtained from the `HTML::Tagset` module.

```
=back
```

```
=head1 EXAMPLES
```

This example extracts all links from a document. It will print one line for each link, containing the URL and the textual description between the `<A>...</A>` tags:

```
use HTML::TokeParser;
$p = HTML::TokeParser->new(shift||"index.html");

while (my $token = $p->get_tag("a")) {
    my $url = $token->[1]{href} || "-";
    my $text = $p->get_trimmed_text("/a");
    print "$url\t$text\n";
}
```

This example extract the `<TITLE>` from the document:

```
use HTML::TokeParser;
$p = HTML::TokeParser->new(shift||"index.html");
if ($p->get_tag("title")) {
    my $title = $p->get_trimmed_text;
    print "Title: $title\n";
}
```

=head1 NAME

HTML::PullParser - Alternative HTML::Parser interface

=head1 SYNOPSIS

use HTML::PullParser;

```
$p = HTML::PullParser->new(file => "index.html",  
    start => 'event, tagname, @attr',  
    end => 'event, tagname',  
    ignore_elements => [qw(script style)],  
    ) || die "Can't open: $!";
```

```
while (my $token = $p->get_token) {  
    #...do something with $token  
}
```

=head1 DESCRIPTION

The `HTML::PullParser` is an alternative interface to the `HTML::Parser` class. It basically turns the `HTML::Parser` inside out. You associate a file (or any `IO::Handle` object or string) with the parser at construction time and then repeatedly call `$parser->get_token` to obtain the tags and text found in the parsed document.

The following methods are provided:

=over 4

=item \$p = `HTML::PullParser->new( file => $file, %options )`

=item \$p  
= `HTML::PullParser->new( doc => \ $doc, %options )`

A `C<HTML::PullParser>` can be made to parse from either a file or a literal document based on whether the `C<file>` or `C<doc>` option is passed to the parser's constructor.

The `C<file>` passed in can either be a file name or a file handle object. If a file name is passed, and it can't be opened for reading, then the constructor will return an undefined value and `#!` will tell you why it failed. Otherwise the argument is taken to be some object that the `C<HTML::PullParser>` can `read()` from when it needs more data. The stream will be `read()` until EOF, but not closed.

A `C<doc>` can be passed plain or as a reference to a scalar. If a reference is passed then the value of this scalar should not be changed before all tokens have been extracted.

Next the information to be returned for the different token types must be set up. This is done by simply associating an `argspec` (as defined in `L<HTML::Parser>`) with the events you have an interest in.

For instance, if you want `C<start>` tokens to be reported as the string `C<'S'>` followed by the tagname and the attributes you might pass an `C<start>`-option like this:

```
$p = HTML::PullParser->new(  
    doc => $document_to_parse,  
    start => "'S'", tagname, @attr,  
    end => "'E'", tagname',
```

);

At last other C<HTML::Parser> options, like C<ignore\_tags>, and C<unbroken\_text>, can be passed in. Note that you should not use the I<event>\_h options to set up parser handlers. That would confuse the inner logic of C<HTML::PullParser>.

=item \$token = \$p->get\_token

This method will return the next I<token> found in the HTML document, or C<undef> at the end of the document. The token is returned as an array reference. The content of this array match the argspec set up during C<HTML::PullParser> construction.

=item \$p->unget\_token( @tokens )

If you find out you have read too many tokens you can push them back, so that they are returned again the next time \$p->get\_token is called.

=back

=head1 EXAMPLES

The 'eg/hform' script shows how we might parse the form section of HTML::Documents using HTML::PullParser.

=head1 NAME

HTML::Filter - Filter HTML text through the parser

=head1 NOTE

B<This module is deprecated.> The C<HTML::Parser> now provides the functionality of C<HTML::Filter> much more efficiently with the the C<default> handler.

=head1 SYNOPSIS

```
require HTML::Filter;
$p = HTML::Filter->new->parse_file("index.html");
```

=head1 DESCRIPTION

C<HTML::Filter> is an HTML parser that by default prints the original text of each HTML element (a slow version of cat(1) basically). The callback methods may be overridden to modify the filtering for some HTML elements and you can override output() method which is called to print the HTML text.

C<HTML::Filter> is a subclass of C<HTML::Parser>. This means that the document should be given to the parser by calling the \$p->parse() or \$p->parse\_file() methods.

=head1 EXAMPLES

The first example is a filter that will remove all comments from an HTML file. This is achieved by simply overriding the comment method to do nothing.

```
package CommentStripper;
require HTML::Filter;
@ISA=qw(HTML::Filter);
sub comment { } # ignore comments
```

The second example shows a filter that will remove any E<lt>TABLE>s found in the HTML file. We specialize the start() and end() methods to count table tags and then make output not happen when inside a table.

```
package TableStripper;
require HTML::Filter;
@ISA=qw(HTML::Filter);
sub start
{
    my $self = shift;
```

```

$self->{table_seen}++ if $_[0] eq "table";
$self->SUPER::start(@_);
}

sub end
{
    my $self = shift;
    $self->SUPER::end(@_);
    $self->{table_seen}-- if $_[0] eq "table";
}

sub output
{
    my $self = shift;
    unless ($self->{table_seen}) {
        $self->SUPER::output(@_);
    }
}

```

If you want to collect the parsed text internally you might want to do something like this:

```

package FilterIntoString;
require HTML::Filter;
@ISA=qw(HTML::Filter);
sub output { push(@{$_[0]->{fhtml}},
    $_[1]) }
sub filtered_html { join("", @{$_[0]->{fhtml}}) }

```

```

OVERVIEW

The HTML-Parser distribution is a collection of modules that parse and extract information from HTML documents. The modules present in this collection are:

HTML::Parser - The parser base class. It receives arbitrary sized chunks of the HTML text, recognizes markup elements, and separates them from the plain text. As different kinds of markup and text are recognized, the corresponding event handlers are invoked.

HTML::Entities - Provides functions to encode and decode text with embedded HTML &lt;entities&gt;.

HTML::HeadParser - A lightweight HTML::Parser subclass that extracts information from the <HEAD> section of an HTML document.

HTML::LinkExtr - An HTML::Parser subclass that extracts links from an HTML document.

HTML::PullParser - An alternative interface to the basic parser that does not require event driven programming.

HTML::TokenParser - An HTML::PullParser subclass with fixed token setup and methods for extracting text. Many simple parsing needs are probably best attacked with this module.

In addition take a look at the HTML-Tree package that build on HTML::Parser to create and extract information from HTML syntax trees (similar to HTML DOM).

## PREREQUISITES

In order to install and use this package you will need Perl version 5.8 or better. The HTML::Tagset module should be installed.

If you intend to use the HTML::HeadParser you probably want to install libwww-perl too.

## INSTALLATION

Just follow the usual procedure:

```
perl Makefile.PL
make
make test
```

make install

## REPORTING BUGS

Bug reports and issues for discussion about these modules can be sent to the <libwww@perl.org> mailing list.

=encoding utf8

=head1 NAME

HTML::Entities - Encode or decode strings with HTML entities

=head1 SYNOPSIS

```
use HTML::Entities;
```

```
$a = "V&aring;re norske tegn b&oslash;r &#230res";
decode_entities($a);
encode_entities($a, "\200-\377");
```

For example, this:

```
$input = "vis-à-vis Beyoncé's naïve\npapier-mâché résumé";
print encode_entities($input), "\n"
```

Prints this out:

```
vis-à-vis Beyoncé's naïve
papier-mâché; r&eacute;sumé;
```

=head1 DESCRIPTION

This module deals with encoding and decoding of strings with HTML character entities. The module provides the following functions:

=over 4

=item decode\_entities( \$string, ... )

This routine replaces HTML entities found in the \$string with the corresponding Unicode character. Unrecognized entities are left alone.

If multiple strings are provided as argument they are each decoded separately and the same number of strings are returned.

If

called in void context the arguments are decoded in-place.

This routine is exported by default.

=item \_decode\_entities( \$string, \%entity2char )

=item \_decode\_entities( \$string, \%entity2char, \$expand\_prefix )

This will in-place replace HTML entities in \$string. The %entity2char hash must be provided. Named entities not found in the %entity2char hash are left alone. Numeric entities are expanded unless their value overflow.

The keys in %entity2char are the entity names to be expanded and their values are what they should expand into. The values do not have to be single character strings. If a key has ";" as suffix, then occurrences in \$string are only expanded if properly terminated with ";". Entities without ";" will be expanded regardless of how they are terminated for compatibility with how common browsers treat entities in the Latin-1 range.

If \$expand\_prefix is TRUE then entities without trailing ";" in %entity2char will even be expanded as a prefix of a longer unrecognized name. The longest matching name in %entity2char will be used. This is mainly present for compatibility with an MSIE misfeature.

```
$string = "foo&nbsp;bar";  
_decode_entities($string, { nb => "@", nbsp => "\xA0" }, 1);  
print $string; # will print "foo bar"
```

This routine is exported by default.

```
=item encode_entities( $string )
```

```
=item encode_entities( $string, $unsafe_chars )
```

This routine replaces unsafe characters in `$string` with their entity representation. A second argument can be given to specify which characters to consider unsafe. The unsafe characters is specified using the regular expression character class syntax (what you find within brackets in regular expressions).

The default set of characters to encode are control chars, high-bit chars, and the `<<< >>>`, `<<< & >>`, `<<< > >>`, `<<< ' >>` and `<<< " >>` characters. But this, for example, would encode `I<just>` the `<<< >>>`, `<<< & >>`, `<<< > >>`, and `<<< " >>` characters:

```
$encoded = encode_entities($input, '<>&"');
```

and

```
this would only encode non-plain ascii:
```

```
$encoded = encode_entities($input, '^\\n\\x20-\\x25\\x27-\\x7e');
```

This routine is exported by default.

```
=item encode_entities_numeric( $string )
```

```
=item encode_entities_numeric( $string, $unsafe_chars )
```

This routine works just like `encode_entities`, except that the replacement entities are always `<&#xI<hexnum>;>` and never `<&I<entname>;>`. For example, `<encode_entities("r\\xF4le")>` returns `"r&ocirc;le"`, but `<encode_entities_numeric("r\\xF4le")>` returns `"r&#xF4;le"`.

This routine is `I<not>` exported by default. But you can always export it with `<use HTML::Entities qw(encode_entities_numeric);>` or even `<use HTML::Entities qw(:DEFAULT encode_entities_numeric);>`

```
=back
```

All these routines modify the string passed as the first argument, if called in a void context. In scalar and array contexts, the encoded or decoded string is returned (without changing the input string).

If you prefer not to import these routines into your namespace, you can call them as:

```
use HTML::Entities ();
$decoded = HTML::Entities::decode($a);
$encoded = HTML::Entities::encode($a);
$encoded = HTML::Entities::encode_numeric($a);
```

The module can also export the %char2entity and the %entity2char hashes, which contain the mapping from all characters to the corresponding entities (and vice versa, respectively).

=head1 NAME

Digest - Modules that calculate message digests

=head1 SYNOPSIS

```
$md5 = Digest->new("MD5");  
$sha1 = Digest->new("SHA-1");  
$sha256 = Digest->new("SHA-256");  
$sha384 = Digest->new("SHA-384");  
$sha512 = Digest->new("SHA-512");  
  
$hmac = Digest->HMAC_MD5($key);
```

=head1 DESCRIPTION

The C<Digest::> modules calculate digests, also called "fingerprints" or "hashes", of some data, called a message. The digest is (usually) some small/fixed size string. The actual size of the digest depend of the algorithm used. The message is simply a sequence of arbitrary bytes or bits.

An important property of the digest algorithms is that the digest is I<likely> to change if the message change in some way. Another property is that digest functions are one-way functions, that is it should be I<hard> to find a message that correspond to some given digest. Algorithms differ in how "likely" and how "hard", as well as how efficient they are to compute.

Note that the properties of the algorithms change over time, as the algorithms are analyzed and machines grow faster. If your application for instance depends on it being "impossible" to generate the same digest for a different message it is wise to make it easy to plug in stronger algorithms as the one used grow weaker. Using the interface documented here should make it easy to change algorithms later.

All C<Digest::> modules provide the same programming interface. A functional interface for simple use, as well as an object oriented interface that can handle messages of arbitrary length and which can read files directly.

The digest can be delivered in three formats:

=over 8

=item I<binary>

This is the most compact form, but it is not well suited for printing or embedding in places that can't handle arbitrary data.

=item I<hex>

A twice as long string of lowercase hexadecimal digits.

=item I<base64>

A string of portable printable characters.

This is the base64 encoded representation of the digest with any trailing padding removed. The string will be about 30% longer than the binary version. L<MIME::Base64> tells you more about this encoding.

=back

The functional interface is simply importable functions with the same name as the algorithm. The functions take the message as argument and return the digest. Example:

```
use Digest::MD5 qw(md5);
$digest = md5($message);
```

There are also versions of the functions with "\_hex" or "\_base64" appended to the name, which returns the digest in the indicated form.

=head1 OO INTERFACE

The following methods are available for all C<Digest::> modules:

=over 4

=item \$ctx = Digest->XXX(\$arg,...)

```
=item $ctx = Digest->new(XXX => $arg,...)
```

```
=item $ctx = Digest::XXX->new($arg,...)
```

The constructor returns some object that encapsulate the state of the message-digest algorithm. You can add data to the object and finally ask for the digest. The "XXX" should of course be replaced by the proper name of the digest algorithm you want to use.

The two first forms are simply syntactic sugar which automatically load the right module on first use. The second form allow you to use algorithm names which contains letters which are not legal perl identifiers, e.g. "SHA-1". If no implementation for the given algorithm can be found, then an exception is raised.

If new() is called as an instance method (i.e. \$ctx->new) it will just reset the state the object to the state of a newly created object. No new object is created in this case, and the return value is the reference to the object (i.e. \$ctx).

```
=item $other_ctx = $ctx->clone
```

The clone method creates a copy of the digest state object and returns a reference to the copy.

```
=item $ctx->reset
```

This is just an alias for \$ctx->new.

```
=item $ctx->add( $data )
```

```
=item $ctx->add( $chunk1, $chunk2, ... )
```

The string value of the \$data provided as argument is appended to the message we calculate the digest for. The return value is the \$ctx object itself.

If more arguments are provided then they are all appended to the message, thus all these lines will have the same effect on the state of the \$ctx object:

```
$ctx->add("a"); $ctx->add("b"); $ctx->add("c");  
$ctx->add("a")->add("b")->add("c");  
$ctx->add("a", "b", "c");  
$ctx->add("abc");
```

Most algorithms are only defined for strings of bytes and this method might therefore croak if the provided arguments contain chars with ordinal number above 255.

```
=item $ctx->addfile( $io_handle )
```

The `$io_handle` is read until EOF and the content is appended to the message we calculate the digest for. The return value is the `$ctx` object itself.

The `addfile()` method will croak() if it fails reading data for some reason. If it croaks it is unpredictable what the state of the `$ctx` object will be in. The `addfile()` method might have been able to read the file partially before it failed. It is probably wise to discard or reset the `$ctx` object if this occurs.

In most cases you want to make sure that the `$io_handle` is in "binmode" before you pass it as argument to the `addfile()` method.

```
=item $ctx->add_bits( $data, $nbits )
```

```
=item $ctx->add_bits( $bitstring )
```

The `add_bits()` method is an alternative to `add()` that allow partial bytes to be appended to the message. Most users should just ignore this method as partial bytes is very unlikely to be of any practical use.

The two argument form of `add_bits()` will add the first `$nbits` bits from `$data`. For the last potentially partial byte only the high order `C<<< $nbits % 8 >>>` bits are used. If `$nbits` is greater than `C<<< length($data) * 8 >>>`, then this method would do the same as `C<<< $ctx->add($data) >>>`.

The one argument form of `add_bits()` takes a `$bitstring` of "1" and "0" chars as argument. It's a shorthand for `C<<< $ctx->add_bits(pack("B*", $bitstring), length($bitstring)) >>>`.

The return value is the `$ctx` object itself.

This example shows two calls that should have the same effect:

```
$ctx->add_bits("111100001010");  
$ctx->add_bits("\xF0\xA0", 12);
```

Most digest algorithms are byte based and for these it is not possible to add bits that are not a multiple of 8, and the `add_bits()` method

will croak if you try.

=item \$ctx->digest

Return the binary digest for the message.

Note that the C<digest> operation is effectively a destructive, read-once operation. Once it has been performed, the \$ctx object is automatically C<reset> and can be used to calculate another digest value. Call \$ctx->clone->digest if you want to calculate the digest without resetting the digest state.

=item \$ctx->hexdigest

Same as \$ctx->digest, but will return the digest in hexadecimal form.

=item \$ctx->b64digest

Same as \$ctx->digest, but will return the digest as a base64 encoded string.

=back

=head1 Digest speed

This table should give some indication on the relative speed of different algorithms. It is sorted by throughput based on a benchmark done with of some implementations of this API:

| Algorithm | Size | Implementation           | MB/s  |
|-----------|------|--------------------------|-------|
| MD4       | 128  | Digest::MD4 v1.3         | 165.0 |
| MD5       | 128  | Digest::MD5 v2.33        | 98.8  |
| SHA-256   | 256  | Digest::SHA2 v1.1.0      | 66.7  |
| SHA-1     | 160  | Digest::SHA v4.3.1       | 58.9  |
| SHA-1     | 160  | Digest::SHA1 v2.10       | 48.8  |
| SHA-256   | 256  | Digest::SHA v4.3.1       | 41.3  |
| Haval-256 | 256  | Digest::Haval256 v1.0.4  | 39.8  |
| SHA-384   | 384  | Digest::SHA2 v1.1.0      | 19.6  |
| SHA-512   | 512  | Digest::SHA2 v1.1.0      | 19.3  |
| SHA-384   | 384  | Digest::SHA v4.3.1       | 19.2  |
| SHA-512   | 512  | Digest::SHA v4.3.1       | 19.2  |
| Whirlpool | 512  | Digest::Whirlpool v1.0.2 | 13.0  |
| MD2       | 128  | Digest::MD2 v2.03        | 9.5   |
| Adler-32  | 32   | Digest::Adler32 v0.03    | 1.3   |
| CRC-16    | 16   | Digest::CRC v0.05        | 1.1   |

|           |     |                        |     |  |
|-----------|-----|------------------------|-----|--|
| CRC-32    | 32  | Digest::CRC            |     |  |
| v0.05     |     | 1.1                    |     |  |
| MD5       | 128 | Digest::Perl::MD5 v1.5 | 1.0 |  |
| CRC-CCITT | 16  | Digest::CRC v0.05      | 0.8 |  |

These numbers was achieved Apr 2004 with ActivePerl-5.8.3 running under Linux on a P4 2.8 GHz CPU. The last 5 entries differ by being pure perl implementations of the algorithms, which explains why they are so slow.

The XFree86/Xorg encoding files are in the public domain.

Most of these encoding files were generated by me in the winter of 1998/1998 from publicly available sources (notably from data files provided by the Unicode Consortium) using a throw-away program written in Common Lisp. Over

the years, a number of people have kindly added new encoding files to the collection.

If you want to add a copyright statement to an encoding file, you need your brain examined.

Compress-Raw-Zlib

Version 2.061

19th May 2013

Copyright (c) 2005-2013 Paul Marquess. All rights reserved.

This program is free software; you can redistribute it and/or modify it under the same terms as Perl itself.

The directory `zlib-src` contains a subset of the source files copied directly from `zlib` version 1.2.8.

These files are Copyright(C) 1995-2012

Jean-loup Gailly and Mark Adler.

Full source for the `zlib` library is available at

<http://www.zlib.org>

DESCRIPTION

-----

This module provides a Perl interface to the zlib compression library.

## PREREQUISITES

-----

Before you can build Compress-Raw-Zlib you need to have the following installed on your system:

- \* A C compiler
  
- \* Perl 5.006 or better.

By

default, Compress-Raw-Zlib will build its own private copy of the zlib library. If you want to use a different version of zlib, follow the instructions in the section called "Controlling the version of zlib used by Compress-Raw-Zlib" later in this document.

## BUILDING THE MODULE

-----

Assuming you have met all the prerequisites, the module can now be built using this sequence of commands:

```
perl Makefile.PL
make
make test
```

## INSTALLATION

-----

To install Compress-Raw-Zlib, run the command below:

```
make install
```

Controlling the version of zlib used by Compress-Raw-Zlib

-----

Compress-Raw-Zlib interfaces to the zlib compression library. There are three options available to control which version/instance of the zlib library is used:

1. Build a private copy of the zlib library using the zlib library source that is included with this module. This is the default and recommended

option.

2. Build a private copy of the zlib library using a standard zlib source distribution.
3. Use a pre-built zlib library.

Note that if you intend to use either Option 2 or 3, you need to have zlib version 1.2.0 or better.

The contents of the file `config.in` are used to control which of the three options is actually used. This file is read during the

```
perl Makefile.PL
```

step of the build, so remember to make any required changes to `config.in` before building this module.

#### Option 1

-----

For option 1, edit the file `config.in` and set the variables in it as follows:

```
BUILD_ZLIB = True
INCLUDE    = ./zlib-src
LIB        = ./zlib-src
OLD_ZLIB   = False
GZIP_OS_CODE = AUTO_DETECT
```

#### Option 2

-----

For option 2, fetch a copy of the zlib source distribution from <http://www.zlib.org> and unpack it into the `Compress-Raw-Zlib` source directory. Assuming you have fetched zlib 1.2.8, it will create a directory called `zlib-1.2.8`.

Now set the variables in the file `config.in` as follows (if the version you have fetched isn't 1.2.8, change the `INCLUDE` and `LIB` variables appropriately):

```
BUILD_ZLIB = True
INCLUDE    = ./zlib-1.2.8
LIB        = ./zlib-1.2.8
OLD_ZLIB   = False
```

GZIP\_OS\_CODE = AUTO\_DETECT

### Option 3

-----

For option 3, you need to find out where zlib is stored on your system. There are two parts to this.

First, find the directory where the zlib library is stored (some common names for the library are libz.a and libz.so). Set the LIB variable in the config.in file to that directory.

Secondly, find the directory where the file zlib.h is stored. Now set the INCLUDE variable in the config.in file to that directory.

Next set BUILD\_ZLIB to False.

Finally, if you are running zlib 1.0.5 or older, set the OLD\_ZLIB variable to True. Otherwise set it to False.

As an example, if the zlib library on your system is in /usr/local/lib, zlib.h is in /usr/local/include and zlib is more recent than version 1.0.5, the variables in config.in should be set as follows:

```
BUILD_ZLIB = False
INCLUDE    = /usr/local/include
LIB        = /usr/local/lib
OLD_ZLIB   = False
GZIP_OS_CODE = AUTO_DETECT
```

### Setting the Gzip OS Code

-----

Every gzip stream stores a byte in its header to identify the Operating System that was used to create the gzip stream. When you build Compress-Raw-Zlib it will attempt to determine the value that is correct for your Operating System. This will then be used by IO::Compress::Gzip as the default value for the OS byte in all gzip headers it creates.

The variable GZIP\_OS\_CODE in the config.in file controls the setting of this value when building Compress-Raw-Zlib. If GZIP\_OS\_CODE is set to AUTO\_DETECT, Compress-Raw-Zlib will attempt to determine the correct value for your Operating System.

Alternatively,  
you can override auto-detection of the default OS code and explicitly set it yourself. Set the GZIP\_OS\_CODE variable in the config.in file to be a number between 0 and 255. For example

```
GZIP_OS_CODE = 3
```

See RFC 1952 for valid OS codes that can be used.

If you are running one of the less popular Operating Systems, it is possible that the default value picked by this module is incorrect or the default value (3) is used when there is a better value available. When Compress-Raw-Zlib cannot determine what operating system you are running, it will use the default value 3 for the OS code.

If you find you have to change this value, because you think the value auto detected is incorrect, please take a few moments to contact the author of this module.

## TROUBLESHOOTING

-----

Undefined Symbol gzsetparams

-----

If you get the error shown below when you run the Compress-Raw-Zlib test harness it probably means you are running a copy of zlib that is version 1.0.5 or older.

```
t/01version.....Can't load 'blib/arch/auto/Compress/Zlib/Zlib.so' for
      module Compress::Raw::Zlib: blib/arch/auto/Compress/Raw/Zlib/Zlib.so:
      undefined symbol: gzsetparams at ...
```

There are two ways to fix this problem:

1. Upgrade to the latest version of zlib.
2. Edit config.in and set the OLD\_ZLIB variable to True.

Test Harness 01version fails

-----

If the 01version test harness fails, and the problem isn't covered by the scenario above, it probably means that you have two versions of zlib installed on your system.

Run the command below to see if this is indeed the case

```
make test TEST_VERBOSE=1 TEST_FILES=t/01version.t
```

Try removing the one you don't want to use and rebuild.

Solaris build fails with "language optional software package not installed"

-----

If you are trying to build this module under Solaris and you get an error message like this

```
/usr/ucb/cc: language optional software package not installed
```

it means that Perl cannot find the C compiler on your system. The cryptic message is just Sun's way of telling you that you haven't bought their C compiler.

When you build a Perl module that needs a C compiler, the Perl build system tries to use the same C compiler that was used to build perl itself. In this case your Perl binary was built with a C compiler that lived in /usr/ucb.

To continue with building this module, you need to get a C compiler, or tell Perl where your C compiler is, if you already have one.

Assuming you have now got a C compiler, what you do next will be dependent on what C compiler you have installed. If you have just installed Sun's C compiler, you shouldn't have to do anything. Just try rebuilding this module.

If you have installed another C compiler, say gcc, you have to tell perl how to use it instead of /usr/ucb/cc.

This set of options seems to work if you want to use gcc. Your mileage may vary.

```
perl Makefile.PL CC=gcc CCCDLFLAGS=-fPIC OPTIMIZE=" "  
make test
```

If that doesn't work for you, it's time to make changes to the Makefile by hand. Good luck!

Solaris build fails with "gcc: unrecognized option `-KPIC'"

-----

You are running Solaris and you get an error like this when you try to build this Perl module

gcc: unrecognized option '-KPIC'

This symptom usually means that you are using a Perl binary that has been built with the Sun C compiler, but you are using gcc to build this module.

When Perl builds modules that need a C compiler, it will attempt to use the same C compiler and command line options that was used to build perl itself. In this case "-KPIC" is a valid option for the Sun C compiler, but not for gcc. The equivalent option for gcc is "-fPIC".

The solution is either:

1. Build both Perl and this module with the same C compiler, either by using the Sun C compiler for both or gcc for both.
2. Try generating the Makefile for this module like this perl

```
perl Makefile.PL CC=gcc CCCDLFLAGS=-fPIC OPTIMIZE="" LD=gcc
make test
```

This second option seems to work when mixing a Perl binary built with the Sun C compiler and this module built with gcc. Your mileage may vary.

#### HP-UX Notes

-----

I've had a report that when building Compress-Raw-Zlib under HP-UX that it is necessary to have first built the zlib library with the -fpic option.

#### Linux Notes

-----

Although most Linux distributions already come with zlib, some people report getting this error when they try to build this module:

```
$ make
cp Zlib.pm blib/lib/Compress/Zlib.pm
AutoSplitting blib/lib/Compress/Zlib.pm (blib/lib/auto/Compress/Zlib)
/usr/bin/perl -I/usr/lib/perl5/5.6.1/i386-linux -I/usr/lib/perl5/5.6.1 /usr/lib/perl5/5.6.1/ExtUtils/xsubpp -typemap
/usr/lib/perl5/5.6.1/ExtUtils/typemap -typemap
typemap Zlib.xs > Zlib.xsc && mv Zlib.xsc Zlib.c
gcc -c -I/usr/local/include -fno-strict-aliasing -I/usr/local/include -O2 -march=i386 -mcpu=i686 -
DVERSION="1.16" -DXS_VERSION="1.16" -fPIC -I/usr/lib/perl5/5.6.1/i386-linux/CORE Zlib.c
Zlib.xs:25:19: zlib.h: No such file or directory
make: *** [Zlib.o] Error 1
```

This usually means that you have not installed the development RPM for zlib. Check for an RPM that start with "zlib-devel" in your Linux distribution.

#### Win32 Notes

-----

If you are running Activestate Perl (from <http://www.activestate.com>), it ships with a pre-compiled version of Compress-Raw-Zlib. To check if a newer version of Compress-Raw-Zlib is available run this from the command prompt

```
C:\> ppm verify -upgrade Compress-Raw-Zlib
```

If you are not running Activestate Perl and you don't have access to a C compiler, you will not be able to build and install this module.

#### Win32 & Cygwin Notes

-----

It is not possible to install Compress-Raw-Zlib using the CPAN shell.

This is because the Compress-Raw-Zlib DLL is itself used by the CPAN shell and it is impossible to remove a DLL while it is already loaded under Windows.

The workaround is to install Compress-Raw-Zlib manually using the instructions given at the start of this file.

#### FEEDBACK

-----

How to report a problem with Compress-Raw-Zlib.

To help me help you, I need all of the following information:

1. The Versions of everything relevant.

This includes:

a. The *\*complete\** output from running this

```
perl -V
```

Do not edit the output in any way.

Note, I want you to run "perl -V" and NOT "perl -v".

If your perl does not understand the "-V" option it is too

old. This module needs Perl version 5.004 or better.

b. The version of Compress-Raw-Zlib you have.

If you have successfully installed Compress-Raw-Zlib, this one-liner will tell you:

```
perl -MCompress::Raw::Zlib -e  
'print qq[ver $Compress::Raw::Zlib::VERSION\n]
```

If you are running windows use this

```
perl -MCompress::Raw::Zlib -e "print qq[ver $Compress::Raw::Zlib::VERSION\n]"
```

If you haven't installed Compress-Raw-Zlib then search Compress::Raw::Zlib.pm for a line like this:

```
$VERSION = "2.061" ;
```

c. The version of zlib you have used.

If you have successfully installed Compress-Raw-Zlib, this one-liner will tell you:

```
perl -MCompress::Raw::Zlib -e "print q[zlib ver ]. Compress::Raw::Zlib::ZLIB_VERSION.qq[\n]"
```

If not, look at the beginning of the file zlib.h.

2. If you are having problems building Compress-Raw-Zlib, send me a complete log of what happened. Start by unpacking the Compress-Raw-Zlib module into a fresh directory and keep a log of all the steps

```
[edit config.in, if necessary]  
perl Makefile.PL  
make  
make test TEST_VERBOSE=1
```

=head1 NAME

Compress::Raw::Zlib - Low-Level Interface to zlib compression library

=head1 SYNOPSIS

```
use Compress::Raw::Zlib ;
```

```
($d, $status) = new Compress::Raw::Zlib::Deflate( [OPT] ) ;
```

```
$status = $d->deflate($input, $output) ;
```

```
$status = $d->flush($output [, $flush_type]) ;
```

```
$d->deflateReset() ;
```

```

$d->deflateParams(OPTS) ;
$d->deflateTune(OPTS) ;
$d->dict_adler() ;
$d->crc32() ;
$d->adler32() ;
$d->total_in() ;
$d->total_out() ;
$d->msg() ;
$d->get_Strategy();
$d->get_Level();
$d->get_BufSize();

```

```

($i, $status) = new Compress::Raw::Zlib::Inflate( [OPT] ) ;
$status = $i->inflate($input, $output [, $eof] ) ;
$status = $i->inflateSync($input) ;
$i->inflateReset() ;
$i->dict_adler() ;
$d->crc32() ;
$d->adler32() ;
$i->total_in() ;
$i->total_out() ;
$i->msg() ;
$d->get_BufSize();

```

```

$src = adler32($buffer [, $src] ) ;
$src = crc32($buffer [, $src] ) ;

```

```

$src = adler32_combine($src1, $src2, $len2)l
$src = crc32_combine($adler1, $adler2, $len2)

```

```

my $version = Compress::Raw::Zlib::zlib_version();
my $flags = Compress::Raw::Zlib::zlibCompileFlags();

```

## =head1 DESCRIPTION

The `Compress::Raw::Zlib` module provides a Perl interface to the `zlib` compression library (see [L</AUTHOR>](#) for details about where to get `zlib`).

## =head1 Compress::Raw::Zlib::Deflate

This section defines an interface that allows in-memory compression using the `deflate` interface provided by `zlib`.

Here is a definition of the interface available:

```
=head2 B<($d, $status) = new Compress::Raw::Zlib::Deflate( [OPT] ) >
```

Initialises a deflation object.

If you are familiar with the I<zlib> library, it combines the features of the I<zlib> functions C<deflateInit>, C<deflateInit2> and C<deflateSetDictionary>.

If successful, it will return the initialised deflation object, C<\$d> and a C<\$status> of C<Z\_OK> in a list context.

In scalar context it returns the deflation object, C<\$d>, only.

If not successful, the returned deflation object, C<\$d>, will be I<undef> and C<\$status> will hold the a I<zlib> error code.

The function optionally takes a number of named options specified as C<< Name => value >> pairs. This allows individual options to be tailored without having to specify them all in the parameter list.

For backward compatibility, it is also possible to pass the parameters as a reference to a hash containing the name=>value pairs.

Below is a list of the valid options:

=over 5

=item B<-Level>

Defines the compression level. Valid values are 0 through 9, C<Z\_NO\_COMPRESSION>, C<Z\_BEST\_SPEED>, C<Z\_BEST\_COMPRESSION>, and C<Z\_DEFAULT\_COMPRESSION>.

The default is C<Z\_DEFAULT\_COMPRESSION>.

=item B<-Method>

Defines the compression method. The only valid value at present (and the default) is C<Z\_DEFLATED>.

=item B<-WindowBits>

To compress an RFC 1950 data stream, set C<WindowBits> to a positive number between 8 and 15.

To compress an RFC 1951 data stream, set C<WindowBits> to C<-MAX\_WBITS>.

To compress an RFC 1952 data stream (i.e. gzip), set C<WindowBits> to C<WANT\_GZIP>.

For a definition of the meaning and valid values for C<WindowBits> refer to the I<zlib> documentation for I<deflateInit2>.

Defaults to C<MAX\_WBITS>.

=item B<-MemLevel>

For a definition of the meaning and valid values for C<MemLevel> refer to the I<zlib> documentation for I<deflateInit2>.

Defaults to MAX\_MEM\_LEVEL.

=item B<-Strategy>

Defines the strategy used to tune the compression. The valid values are C<Z\_DEFAULT\_STRATEGY>, C<Z\_FILTERED>, C<Z\_RLE>, C<Z\_FIXED> and C<Z\_HUFFMAN\_ONLY>.

The default is C<Z\_DEFAULT\_STRATEGY>.

=item B<-Dictionary>

When a dictionary is specified I<Compress::Raw::Zlib> will automatically call C<deflateSetDictionary> directly after calling C<deflateInit>. The Adler32 value for the dictionary can be obtained by calling the method C<\$d-E<gt>dict\_adler()>.

The default is  
no dictionary.

=item B<-Bufsize>

Sets the initial size for the output buffer used by the C<\$d-E<gt>deflate> and C<\$d-E<gt>flush> methods. If the buffer has to be reallocated to increase the size, it will grow in increments of C<Bufsize>.

The default buffer size is 4096.

=item B<-AppendOutput>

This option controls how data is written to the output buffer by the C<\$d-E<gt>deflate> and C<\$d-E<gt>flush> methods.

If the C<AppendOutput> option is set to false, the output buffers in the C<\$d-E<gt>deflate> and C<\$d-E<gt>flush> methods will be truncated before uncompressed data is written to them.

If the option is set to true, uncompressed data will be appended to the output buffer in the C<\$d-E<gt>deflate> and C<\$d-E<gt>flush> methods.

This option defaults to false.

=item B<-CRC32>

If set to true, a crc32 checksum of the uncompressed data will be calculated. Use the C<\$d-E<gt>crc32> method to retrieve this value.

This option defaults to false.

=item B<-ADLER32>

If set to true, an Adler32 checksum of the uncompressed data will be calculated. Use the C<\$d-E<gt>adler32> method to retrieve this value.

This option defaults to false.

=back

Here is an example of using the C<Compress::Raw::Zlib::Deflate> optional parameter list to override the default buffer size and compression level. All other options will take their default values.

```
my $d = new Compress::Raw::Zlib::Deflate ( -Bufsize => 300,  
                                           -Level  => Z_BEST_SPEED );
```

=head2 B<\$status = \$d-E<gt>deflate(\$input, \$output)>

Deflates the contents of C<\$input> and writes the compressed data to C<\$output>.

The C<\$input> and C<\$output> parameters can be either scalars or scalar references.

When finished, C<\$input> will be completely processed (assuming there were no errors). If the deflation was successful it writes the deflated data to C<\$output> and returns a status value of C<Z\_OK>.

On error, it returns a I<zlib> error code.

If the C<AppendOutput> option is set to true in the constructor for the C<\$d> object, the compressed data will be appended to C<\$output>. If it is false, C<\$output> will be truncated before any compressed data is

written to it.

**Note:** This method will not necessarily write compressed data to C<\$output> every time it is called. So do not assume that there has been an error if the contents of C<\$output> is empty on returning from this method. As long as the return code from the method is C<Z\_OK>, the deflate has succeeded.

```
=head2 B<$status = $d-E<gt>flush($output [, $flush_type]) >
```

Typically used to finish the deflation. Any pending output will be written to C<\$output>.

Returns C<Z\_OK> if successful.

Note that flushing can seriously degrade the compression ratio, so it should only be used to terminate a decompression (using C<Z\_FINISH>) or when you want to create a I<full flush point> (using C<Z\_FULL\_FLUSH>).

By default the C<flush\_type> used is C<Z\_FINISH>. Other valid values for C<flush\_type> are C<Z\_NO\_FLUSH>, C<Z\_PARTIAL\_FLUSH>, C<Z\_SYNC\_FLUSH> and C<Z\_FULL\_FLUSH>. It is strongly recommended that you only set the C<flush\_type> parameter if you fully understand the implications of what it does. See the C<zlib> documentation for details.

If the C<AppendOutput> option is set to true in the constructor for the C<\$d> object, the compressed data will be appended to C<\$output>. If it is false, C<\$output> will be truncated before any compressed data is written to it.

```
=head2 B<$status = $d-E<gt>deflateReset() >
```

This method will reset the deflation object C<\$d>. It can be used when you are compressing multiple data streams and want to use the same object to compress each of them. It should only be used once the previous data stream has been flushed successfully, i.e. a call to C<< \$d->flush(Z\_FINISH) >> has returned C<Z\_OK>.

Returns C<Z\_OK> if successful.

```
=head2 B<$status = $d-E<gt>deflateParams([OPT])>
```

Change settings for the deflate object C<\$d>.

The list of the valid options is shown below.

Options not specified  
will remain unchanged.

=over 5

=item B<-Level>

Defines the compression level. Valid values are 0 through 9, C<Z\_NO\_COMPRESSION>, C<Z\_BEST\_SPEED>, C<Z\_BEST\_COMPRESSION>, and C<Z\_DEFAULT\_COMPRESSION>.

=item B<-Strategy>

Defines the strategy used to tune the compression. The valid values are C<Z\_DEFAULT\_STRATEGY>, C<Z\_FILTERED> and C<Z\_HUFFMAN\_ONLY>.

=item B<-BufSize>

Sets the initial size for the output buffer used by the C<\$d-E<gt>deflate> and C<\$d-E<gt>flush> methods. If the buffer has to be reallocated to increase the size, it will grow in increments of C<Bufsize>.

=back

=head2 B<\$status = \$d-E<gt>deflateTune(\$good\_length, \$max\_lazy, \$nice\_length, \$max\_chain)>

Tune the internal settings for the deflate object C<\$d>. This option is only available if you are running zlib 1.2.2.3 or better.

Refer to the documentation in zlib.h for instructions on how to fly C<deflateTune>.

=head2 B<\$d-E<gt>dict\_adler()>

Returns the Adler32 value for the dictionary.

=head2

B<\$d-E<gt>crc32()>

Returns the CRC32 value for the uncompressed data to date.

If the C<CRC32> option is not enabled in the constructor for this object, this method will always return 0;

=head2 B<\$d-E<gt>adler32()>

Returns the Adler32 value for the uncompressed data to date.

=head2 B<\$d-E<gt>msg()>

Returns the last error message generated by zlib.

```
=head2 B<$d-E<gt>total_in(>
```

Returns the total number of bytes uncompressed bytes input to deflate.

```
=head2 B<$d-E<gt>total_out(>
```

Returns the total number of compressed bytes output from deflate.

```
=head2 B<$d-E<gt>get_Strategy(>
```

Returns the deflation strategy currently used. Valid values are C<Z\_DEFAULT\_STRATEGY>, C<Z\_FILTERED> and C<Z\_HUFFMAN\_ONLY>.

```
=head2 B<$d-E<gt>get_Level(>
```

Returns the compression level being used.

```
=head2 B<$d-E<gt>get_BufSize(>
```

Returns the buffer size used to carry out the compression.

```
=head2 Example
```

Here is a trivial example of using C<deflate>. It simply reads standard input, deflates it and writes it to standard output.

```
use strict ;
use warnings ;

use Compress::Raw::Zlib ;

binmode STDIN;
binmode STDOUT;
my $x = new Compress::Raw::Zlib::Deflate
    or die "Cannot create a deflation stream\n" ;

my ($output, $status) ;
while (<>)
{
    $status = $x->deflate($_, $output) ;

    $status == Z_OK
        or die "deflation failed\n" ;
```

```

    print $output ;
}

$status = $x->flush($output) ;

$status == Z_OK
    or die "deflation failed\n" ;

print $output ;

```

```
=head1 Compress::Raw::Zlib::Inflate
```

This section defines an interface that allows in-memory uncompression using the I<inflate> interface provided by zlib.

Here is a definition of the interface:

```
=head2 B<($i, $status) = new Compress::Raw::Zlib::Inflate( [OPT] ) >
```

Initialises an inflation object.

In a list context it returns the inflation object, C<\$i>, and the I<zlib> status code (C<\$status>). In a scalar context it returns the inflation object only.

If successful, C<\$i> will hold the inflation object and C<\$status> will be C<Z\_OK>.

If not successful, C<\$i> will be I<undef> and C<\$status> will hold the I<zlib> error code.

The function optionally takes a number of named options specified as C<< -Name => value >> pairs. This allows individual options to be tailored without having to specify them all in the parameter list.

For backward compatibility, it is also possible to pass the parameters as a reference to a hash containing the C<< name=>value >> pairs.

Here is a list of the valid options:

```
=over 5
```

```
=item B<-WindowBits>
```

To uncompress an RFC 1950 data stream, set C<WindowBits> to a positive number between 8 and 15.

To uncompress an RFC 1951 data stream, set C<WindowBits> to C<-MAX\_WBITS>.

To uncompress an RFC 1952 data stream (i.e. gzip), set C<WindowBits> to C<WANT\_GZIP>.

To auto-detect and uncompress an RFC 1950 or RFC 1952 data stream (i.e. gzip), set C<WindowBits> to C<WANT\_GZIP\_OR\_ZLIB>.

For

a full definition of the meaning and valid values for C<WindowBits> refer to the I<zlib> documentation for I<inflateInit2>.

Defaults to C<MAX\_WBITS>.

=item B<-Bufsize>

Sets the initial size for the output buffer used by the C<\${i-E}<gt;inflate> method. If the output buffer in this method has to be reallocated to increase the size, it will grow in increments of C<Bufsize>.

Default is 4096.

=item B<-Dictionary>

The default is no dictionary.

=item B<-AppendOutput>

This option controls how data is written to the output buffer by the C<\${i-E}<gt;inflate> method.

If the option is set to false, the output buffer in the C<\${i-E}<gt;inflate> method will be truncated before uncompressed data is written to it.

If the option is set to true, uncompressed data will be appended to the output buffer by the C<\${i-E}<gt;inflate> method.

This option defaults to false.

=item B<-CRC32>

If set to true, a crc32 checksum of the uncompressed data will be calculated. Use the C<\${i-E}<gt;crc32> method to retrieve this value.

This option defaults to false.

=item B<-ADLER32>

If set to true, an Adler32 checksum of the uncompressed data will be calculated. Use the `C<$.E>adler32` method to retrieve this value.

This option defaults to false.

=item B<-ConsumeInput>

If set to true, this option will remove compressed data from the input buffer of the `C<< $i->inflate >>` method as the inflate progresses.

This option can be useful when you are processing compressed data that is embedded in another file/buffer. In this case the data that immediately follows the compressed stream will be left in the input buffer.

This option defaults to true.

=item B<-LimitOutput>

The `C<LimitOutput>` option changes the behavior of the `C<< $i->inflate >>` method so that the amount of memory used by the output buffer can be limited.

When `C<LimitOutput>` is used the size of the output buffer used will either be the value of the `C<Bufsize>` option or the amount of memory already allocated to `C<$output>`, whichever is larger. Predicting the output size available is tricky, so don't rely on getting an exact output buffer size.

When `C<LimitOutput>` is not specified `C<< $i->inflate >>` will use as much memory as it takes to write all the uncompressed data it creates by uncompressing the input buffer.

If `C<LimitOutput>` is enabled, the `C<ConsumeInput>` option will also be enabled.

This option defaults to false.

See [L</The LimitOutput option>](#) for a discussion on why `C<LimitOutput>` is needed and how to use it.

=back

Here is an example of using an optional parameter to override the default buffer size.

```
my ($i, $status) = new Compress::Raw::Zlib::Inflate( -Bufsize => 300 );
```

=head2 B< \$status = \$i-E<gt>inflate(\$input, \$output [, \$eof]) >

Inflates the complete contents of C<\$input> and writes the uncompressed data to C<\$output>. The C<\$input> and C<\$output> parameters can either be scalars or scalar references.

Returns C<Z\_OK> if successful and C<Z\_STREAM\_END> if the end of the compressed data has been successfully reached.

If not successful C<\$status> will hold the I<zlib> error code.

If the C<ConsumeInput> option has been set to true when the C<Compress::Raw::Zlib::Inflate> object is created, the C<\$input> parameter is modified by C<inflate>. On completion it will contain what remains of the input buffer after inflation. In practice, this means that when the return status is C<Z\_OK> the C<\$input> parameter will contain an empty string, and when the return status is C<Z\_STREAM\_END> the C<\$input> parameter will contain what (if anything) was stored in the input buffer after the deflated data stream.

This feature is useful when processing a file format that encapsulates a compressed data stream (e.g. gzip, zip) and there is useful data immediately after the deflation stream.

If the C<AppendOutput> option is set to true in the constructor for this object, the uncompressed data will be appended to C<\$output>. If it is false, C<\$output> will be truncated before any uncompressed data is written to it.

The C<\$eof> parameter needs a bit of explanation.

Prior to version 1.2.0, zlib assumed that there was at least one trailing byte immediately after the compressed data stream when it was carrying out decompression. This normally isn't a problem because the majority of zlib applications guarantee that there will be data directly after the compressed data stream. For example, both gzip (RFC 1950) and zip both define trailing data that follows the compressed data stream.

The C<\$eof> parameter only needs to be used if B<all> of the following conditions apply

=over 5

=item 1

You are either using a copy of zlib that is older than version 1.2.0 or you

want your application code to be able to run with as many different versions of zlib as possible.

=item 2

You have set the C<WindowBits> parameter to C<-MAX\_WBITS> in the constructor for this object, i.e. you are uncompressing a raw deflated data stream (RFC 1951).

=item 3

There is no data immediately after the compressed data stream.

=back

If B<all> of these are the case, then you need to set the C<\$eof> parameter to true on the final call (and only the final call) to C<\$i-E<gt>inflate>.

If you have built this module with zlib >= 1.2.0, the C<\$eof> parameter is ignored. You can still set it if you want, but it won't be used behind the scenes.

=head2 B<\$status = \$i-E<gt>inflateSync(\$input)>

This method can be used to attempt to recover good data from a compressed data stream that is partially corrupt.

It scans C<\$input> until it reaches either a I<full flush point> or the end of the buffer.

If a I<full flush point> is found, C<Z\_OK> is returned and C<\$input> will be have all data up to the flush point removed. This data can then be passed to the C<\$i-E<gt>inflate> method to be uncompressed.

Any other return code means that a flush point was not found. If more data is available, C<inflateSync> can be called repeatedly with more compressed data until the flush point is found.

Note

I<full flush points> are not present by default in compressed data streams. They must have been added explicitly when the data stream was created by calling C<Compress::Deflate::flush> with C<Z\_FULL\_FLUSH>.

=head2 B<\$status = \$i-E<gt>inflateReset() >

This method will reset the inflation object C<\$i>. It can be used when you are uncompressing multiple data streams and want to use the same object to uncompress each of them.

Returns C<Z\_OK> if successful.

```
=head2 B<$i-E<gt>dict_adler()>
```

Returns the Adler32 value for the dictionary.

```
=head2 B<$i-E<gt>crc32()>
```

Returns the CRC32 value for the uncompressed data to date.

If the C<CRC32> option is not enabled in the constructor for this object, this method will always return 0;

```
=head2 B<$i-E<gt>adler32()>
```

Returns the Adler32 value for the uncompressed data to date.

If the C<ADLER32> option is not enabled in the constructor for this object, this method will always return 0;

```
=head2 B<$i-E<gt>msg()>
```

Returns the last error message generated by zlib.

```
=head2 B<$i-E<gt>total_in()>
```

Returns the total number of bytes compressed bytes input to inflate.

```
=head2 B<$i-E<gt>total_out()>
```

Returns the total number of uncompressed bytes output from inflate.

```
=head2 B<$d-E<gt>get_BufSize()>
```

Returns the buffer size used to carry out the decompression.

```
=head2 Examples
```

Here is an example of using C<inflate>.

```
use strict ;  
use warnings ;
```

```
use Compress::Raw::Zlib;
```

```
my $x = new Compress::Raw::Zlib::Inflate()
```

```
or die "Cannot create a inflation stream\n" ;
```

```
my $input = " ;  
binmode STDIN;  
binmode STDOUT;  
  
my ($output, $status) ;  
while (read(STDIN, $input, 4096))  
{  
    $status = $x->inflate($input, $output) ;  
  
    print $output ;  
  
    last if $status != Z_OK ;  
}  
  
die "inflation failed\n"  
    unless $status == Z_STREAM_END ;
```

The next example show how to use the C<LimitOutput> option. Notice the use of two nested loops in this case.

The outer loop reads the data from the input source - STDIN and the inner loop repeatedly calls C<inflate> until C<\$input> is exhausted, we get an error, or the end of the stream is reached. One point worth remembering is by using the C<LimitOutput> option you also get C<ConsumeInput> set as well - this makes the code below much simpler.

```
use strict ;  
use warnings ;  
  
use Compress::Raw::Zlib;  
  
my $x = new Compress::Raw::Zlib::Inflate(LimitOutput => 1)  
    or die "Cannot create a inflation stream\n" ;  
  
my $input = " ;  
binmode STDIN;  
binmode STDOUT;  
  
my ($output, $status) ;  
  
OUTER:  
while (read(STDIN, $input, 4096))  
{  
    do  
    {  
        $status = $x->inflate($input, $output) ;
```

```

    print $output ;

    last OUTER
    unless $status == Z_OK || $status == Z_BUF_ERROR ;
  }
  while ($status == Z_OK && length $input);
}

die "inflation failed\n"
unless $status
== Z_STREAM_END ;

```

## =head1 CHECKSUM FUNCTIONS

Two functions are provided by I<zlib> to calculate checksums. For the Perl interface, the order of the two parameters in both functions has been reversed. This allows both running checksums and one off calculations to be done.

```

$src = Adler32($buffer [, $src] );
$src = CRC32($buffer [, $src] );

```

The buffer parameters can either be a scalar or a scalar reference.

If the \$src parameters is C<undef>, the crc value will be reset.

If you have built this module with zlib 1.2.3 or better, two more CRC-related functions are available.

```

$src = Adler32_combine($src1, $src2, $len2)
$src = CRC32_combine($adler1, $adler2, $len2)

```

These functions allow checksums to be merged.

## =head1 Misc

```

=head2 my $version = Compress::Raw::Zlib::zlib_version();

```

Returns the version of the zlib library.

```

=head2 my $flags = Compress::Raw::Zlib::zlibCompileFlags();

```

Returns the flags indicating compile-time options that were used to build the zlib

library. See the zlib documentation for a description of the flags returned by C<zlibCompileFlags>.

Note that when the zlib sources are built along with this module the C<sprintf> flags (bits 24, 25 and 26) should be ignored.

If you are using zlib 1.2.0 or older, C<zlibCompileFlags> will return 0.

=head1 The LimitOutput option.

By default C<< \$i->inflate(\$input, \$output) >> will uncompress I<all> data in C<\$input> and write I<all> of the uncompressed data it has generated to C<\$output>. This makes the interface to C<inflate> much simpler - if the method has uncompressed C<\$input> successfully I<all> compressed data in C<\$input> will have been dealt with. So if you are reading from an input source and uncompressing as you go the code will look something like this

```
use strict ;
use warnings ;

use Compress::Raw::Zlib;

my $x = new Compress::Raw::Zlib::Inflate()
    or die "Cannot create a inflation stream\n" ;

my $input = " ;

my ($output,
$status) ;
while (read(STDIN, $input, 4096))
{
    $status = $x->inflate($input, $output) ;

    print $output ;

    last if $status != Z_OK ;
}

die "inflation failed\n"
    unless $status == Z_STREAM_END ;
```

The points to note are

=over 5

=item \*

The main processing loop in the code handles reading of compressed data from STDIN.

=item \*

The status code returned from `C<inflate>` will only trigger termination of the main processing loop if it isn't `C<Z_OK>`. When `C<LimitOutput>` has not been used the `C<Z_OK>` status means means that the end of the compressed data stream has been reached or there has been an error in uncompression.

=item \*

After the call to `C<inflate>` I<all> of the uncompressed data in `C<$input>` will have been processed. This means the subsequent call to `C<read>` can overwrite it's contents without any problem.

=back

For most use-cases the behavior described above is acceptable (this module and it's predecessor, `C<Compress::Zlib>`, have used it for over 10 years without an issue), but in a few very specific use-cases the amount of memory required for `C<$output>` can prohibitively large. For example, if the compressed data stream contains the same pattern repeated thousands of times, a relatively small compressed data stream can uncompress into hundreds of megabytes. Remember `C<inflate>` will keep allocating memory until I<all> the uncompressed data has been written to the output buffer - the size of `C<$output>` is unbounded.

The `C<LimitOutput>` option is designed to help with this use-case.

The main difference in your code when using `C<LimitOutput>` is having to deal with cases where the `C<$input>` parameter still contains some uncompressed data that `C<inflate>` hasn't processed yet. The status code returned from `C<inflate>` will be `C<Z_OK>` if uncompression took place and `C<Z_BUF_ERROR>` if the output buffer is full.

Below is typical code that shows how to use `C<LimitOutput>`.

```
use strict ;
use warnings
;

use Compress::Raw::Zlib;

my $x = new Compress::Raw::Zlib::Inflate(LimitOutput => 1)
    or die "Cannot create a inflation stream\n" ;

my $input = " ;
binmode STDIN;
binmode STDOUT;
```

```
my ($output, $status) ;
```

OUTER:

```
while (read(STDIN, $input, 4096))
{
  do
  {
    $status = $x->inflate($input, $output) ;

    print $output ;

    last OUTER
    unless $status == Z_OK || $status == Z_BUF_ERROR ;
  }
  while ($status == Z_OK && length $input);
}

die "inflation failed\n"
unless $status == Z_STREAM_END ;
```

Points to note this time:

=over 5

=item \*

There are now two nested loops in the code: the outer loop for reading the compressed data from STDIN, as before; and the inner loop to carry out the uncompression.

=item \*

There are two exit points from the inner uncompression loop.

Firstly when C<inflate> has returned a status other than C<Z\_OK> or C<Z\_BUF\_ERROR>.

This means that either the end of the compressed data stream has been reached (C<Z\_STREAM\_END>) or there is an error in the compressed data. In either of these cases there is no point in continuing with reading the compressed data, so both loops are terminated.

The second exit point tests if there is any data left in the input buffer, C<\$input> - remember that the C<ConsumeInput> option is automatically enabled when C<LimitOutput> is used. When the input buffer has been exhausted, the outer loop can run again and overwrite a now empty C<\$input>.

=back

## =head1 ACCESSING ZIP FILES

Although it is possible (with some effort on your part) to use this module to access .zip files, there are other perl modules available that will do all the hard work for you. Check out C<Archive::Zip>, C<Archive::Zip::SimpleZip>, C<IO::Compress::Zip> and C<IO::Uncompress::Unzip>.

## =head1 FAQ

### =head2 Compatibility with Unix compress/uncompress.

This module is not compatible with Unix C<compress>.

If

you have the C<uncompress> program available, you can use this to read compressed files

```
open F, "uncompress -c $filename |";
while (<F>)
{
    ...
}
```

Alternatively, if you have the C<gunzip> program available, you can use this to read compressed files

```
open F, "gunzip -c $filename |";
while (<F>)
{
    ...
}
```

and this to write compress files, if you have the C<compress> program available

```
open F, "| compress -c $filename ";
print F "data";
...
close F ;
```

### =head2 Accessing .tar.Z files

See previous FAQ item.

If the C<Archive::Tar> module is installed and either the C<uncompress> or C<gunzip> programs are available, you can use one of these workarounds to read C<.tar.Z> files.

Firstly with C<uncompress>

```
use strict;
use warnings;
use Archive::Tar;

open F, "uncompress -c $filename |";
my $tar = Archive::Tar->new(*F);
...
```

and this with C<gunzip>

```
use strict;
use warnings;
use Archive::Tar;

open F, "gunzip -c $filename |";
my $tar = Archive::Tar->new(*F);
...
```

Similarly, if the C<compress> program is available, you can use this to write a C<.tar.Z> file

```
use strict;
use warnings;
use Archive::Tar;
use IO::File;

my $fh = new IO::File "| compress -c >$filename";
my $tar = Archive::Tar->new();
...
$tar->write($fh);
$fh->close ;
```

=head2 Zlib Library Version Support

By default C<Compress::Raw::Zlib> will build with a private copy of version 1.2.5 of the zlib library. (See the F<README> file for details of how to override this behaviour)

If you decide to use a different version of the zlib library, you need to be aware of the following issues

=over 5

=item \*

First off, you must have zlib 1.0.5 or better.

=item \*

You need to have zlib 1.2.1 or better if you want to use the C<-Merge> option with C<IO::Compress::Gzip>, C<IO::Compress::Deflate> and C<IO::Compress::RawDeflate>.

=back

=head1 CONSTANTS

All the I<zlib> constants are automatically imported when you make use of I<Compress::Raw::Zlib>.

## =head1 EXIT CODES

If all your tests passed, Test::Builder will exit with zero (which is normal). If anything failed it will exit with how many failed. If you run less (or more) tests than you planned, the missing (or extras) will be considered failures. If no tests were ever run Test::Builder will throw a warning and exit with 255. If the test died, even after having successfully completed all its tests, it will still be considered a failure and will exit with 255.

So the exit codes are...

|                  |   |
|------------------|---|
| 0                | all tests successful                          |
| 255              | test died                                     |
| any other number | how many failed (including missing or extras) |

If you fail more than 254 tests, it will be reported as 254.

B<NOTE> This behavior may go away in future versions.

## =head1 CAVEATS and NOTES

=over 4

=item Backwards compatibility

Test::More works with Perls as old as 5.004\_05.

=item Overloaded objects

String overloaded

objects are compared B<as strings>. This prevents Test::More from piercing an object's interface allowing better blackbox testing. So if a function starts returning overloaded objects instead of bare strings your tests won't notice the difference. This is good.

However, it does mean that functions like `is_deeply()` cannot be used to test the internals of string overloaded objects. In this case I would suggest Test::Deep which contains more flexible testing functions for complex data structures.

=item Threads

Test::More will only be aware of threads if "use threads" has been done I<before> Test::More is loaded. This is ok:

```
use threads;
use Test::More;
```

This may cause problems:

```
use Test::More
use threads;
```

=item Test::Harness upgrade

`no_plan` and `todo` depend on new Test::Harness features and fixes. If you're going to distribute tests that use `no_plan` or `todo` your end-users will have to upgrade Test::Harness to the latest one on CPAN. If you avoid `no_plan` and `TODO` tests, the stock Test::Harness will work fine.

Installing Test::More should also upgrade Test::Harness.

=back

=head1 HISTORY

This is a case of convergent evolution with Joshua Pritikin's Test module. I was largely unaware of its existence when I'd first

written my own ok() routines. This module exists because I can't figure out how to easily wedge test names into Test's interface (along with a few other problems).

The goal here is to have a testing utility that's simple to learn, quick to use and difficult to trip yourself up with while still providing more flexibility than the existing Test.pm. As such, the names of the most common routines are kept tiny, special cases and magic side-effects are kept to a minimum. WYSIWYG.

=head1 SEE ALSO

L<Test::Simple> if all this confuses you and you just want to write some tests. You can upgrade to Test::More later (it's forward compatible).

L<Test> is the old testing module. Its main benefit is that it has been distributed with Perl since 5.004\_05.

L<Test::Harness> for details on how your test results are interpreted by Perl.

L<Test::Differences> for more ways to test complex data structures. And it plays well with Test::More.

L<Test::Class> is like XUnit but more perlish.

L<Test::Deep> gives you more powerful complex data structure testing.

L<Test::Unit> is XUnit style testing.

L<Test::Inline> shows the idea of embedded testing.

L<Bundle::Test> installs a whole bunch of useful test modules.

=head1 NAME

ppport.h - Perl/Pollution/Portability version 3.20\_01

=head1 SYNOPSIS

```
perl ppport.h [options] [source files]
```

Searches current directory for files if no [source files] are given

--help            show short help

--version        show version

--patch=file     write one patch file with changes

--copy=suffix    write changed copies with suffix

--diff=program   use diff program and options

--compat-version=version provide compatibility with Perl version  
--cplusplus accept C++ comments

--quiet don't output anything except fatal errors  
--nodiag don't show diagnostics  
--nohints don't show hints  
--nochanges don't suggest changes  
--nofilter don't filter input files

--strip strip all script and doc functionality from  
ppport.h

--list-provided list provided API  
--list-unsupported list unsupported API  
--api-info=name show Perl API portability information

## =head1 COMPATIBILITY

This version of F<ppport.h> is designed to support operation with Perl installations back to 5.003, and has been tested up to 5.11.5.

## =head1 OPTIONS

### =head2 --help

Display a brief usage summary.

### =head2 --version

Display the version of F<ppport.h>.

### =head2 --patch=I<file>

If this option is given, a single patch file will be created if any changes are suggested. This requires a working diff program to be installed on your system.

### =head2 --copy=I<suffix>

If this option is given, a copy of each file will be saved with the given suffix that contains the suggested changes. This does not require any external programs. Note that this does not automagially add a dot between the original filename and the suffix. If you want the dot, you have to include it in the option argument.

If neither C<--patch> or C<--copy> are given, the default is to

simply print the diffs for each file. This requires either C<Text::Diff> or a C<diff> program to be installed.

```
=head2 --diff=I<program>
```

Manually set the diff program and options to use. The default is to use C<Text::Diff>, when installed, and output unified context diffs.

```
=head2 --compat-version=I<version>
```

Tell F<ppport.h> to check for compatibility with the given Perl version. The default is to check for compatibility with Perl version

5.003. You can use this option to reduce the output of F<ppport.h> if you intend to be backward compatible only down to a certain Perl version.

```
=head2 --cplusplus
```

Usually, F<ppport.h> will detect C++ style comments and replace them with C style comments for portability reasons. Using this option instructs F<ppport.h> to leave C++ comments untouched.

```
=head2 --quiet
```

Be quiet. Don't print anything except fatal errors.

```
=head2 --nodiag
```

Don't output any diagnostic messages. Only portability alerts will be printed.

```
=head2 --nohints
```

Don't output any hints. Hints often contain useful portability notes. Warnings will still be displayed.

```
=head2 --nochanges
```

Don't suggest any changes. Only give diagnostic output and hints unless these are also deactivated.

```
=head2 --nofilter
```

Don't filter the list of input files. By default, files not looking like source code (i.e. not \*.xs, \*.c, \*.cc, \*.cpp or \*.h) are skipped.

=head2 --strip

Strip all script and documentation functionality from F<ppport.h>.

This

reduces the size of F<ppport.h> dramatically and may be useful if you want to include F<ppport.h> in smaller modules without increasing their distribution size too much.

The stripped F<ppport.h> will have a C<--unstrip> option that allows you to undo the stripping, but only if an appropriate C<Devel::PPPort> module is installed.

=head2 --list-provided

Lists the API elements for which compatibility is provided by F<ppport.h>. Also lists if it must be explicitly requested, if it has dependencies, and if there are hints or warnings for it.

=head2 --list-unsupported

Lists the API elements that are known not to be supported by F<ppport.h> and below which version of Perl they probably won't be available or work.

=head2 --api-info=I<name>

Show portability information for API elements matching I<name>. If I<name> is surrounded by slashes, it is interpreted as a regular expression.

=head1 DESCRIPTION

In order for a Perl extension (XS) module to be as portable as possible across differing versions of Perl itself, certain steps need to be taken.

=over 4

=item \*

Including this header is the first major one. This alone will give you access to a large part of the Perl API that hasn't been available in earlier Perl releases. Use

```
perl ppport.h --list-provided
```

to see which API elements are provided by ppport.h.

=item \*

You should avoid using deprecated parts of the API. For example, using global Perl variables without the C<PL\_> prefix is deprecated. Also, some API functions used to have a C<perl\_> prefix. Using this form is also deprecated. You can safely use the supported API, as F<ppport.h> will provide wrappers for older Perl versions.

=item \*

If you use one of a few functions or variables that were not present in earlier versions of Perl, and that can't be provided using a macro, you have to explicitly request support for these functions by adding one or more C<#define>s in your source code before the inclusion of F<ppport.h>.

These functions  
or variables will be marked C<explicit> in the list shown  
by C<--list-provided>.

Depending on whether your module has a single or multiple files that use such functions or variables, you want either C<static> or global variants.

For a C<static> function or variable (used only in a single source file), use:

```
#define NEED_function  
#define NEED_variable
```

For a global function or variable (used in multiple source files), use:

```
#define NEED_function_GLOBAL  
#define NEED_variable_GLOBAL
```

Note that you mustn't have more than one global request for the same function or variable in your project.

| Function / Variable | Static Request   | Global Request          |
|---------------------|------------------|-------------------------|
| PL_parser           | NEED_PL_parser   | NEED_PL_parser_GLOBAL   |
| PL_signals          | NEED_PL_signals  | NEED_PL_signals_GLOBAL  |
| eval_pv()           | NEED_eval_pv     | NEED_eval_pv_GLOBAL     |
| grok_bin()          | NEED_grok_bin    | NEED_grok_bin_GLOBAL    |
| grok_hex()          | NEED_grok_hex    | NEED_grok_hex_GLOBAL    |
| grok_number()       | NEED_grok_number | NEED_grok_number_GLOBAL |

|                          |                             |                                    |
|--------------------------|-----------------------------|------------------------------------|
| grok_numeric_radix()     | NEED_grok_numeric_radix     | NEED_grok_numeric_radix_GLOBAL     |
| grok_oct()               | NEED_grok_oct               | NEED_grok_oct_GLOBAL               |

| pv_escape()              | NEED_pv_escape              | NEED_pv_escape_GLOBAL              |
| pv_pretty()              | NEED_pv_pretty              | NEED_pv_pretty_GLOBAL              |
| sv_2pv_flags()           | NEED_sv_2pv_flags           | NEED_sv_2pv_flags_GLOBAL           |
| sv_2pvbyte()             | NEED_sv_2pvbyte             | NEED_sv_2pvbyte_GLOBAL             |
| sv_catpvf_mg()           | NEED_sv_catpvf_mg           | NEED_sv_catpvf_mg_GLOBAL           |
| sv_catpvf_mg_nocontext() | NEED_sv_catpvf_mg_nocontext | NEED_sv_catpvf_mg_nocontext_GLOBAL |
| sv_pvn_force_flags()     | NEED_sv_pvn_force_flags     | NEED_sv_pvn_force_flags_GLOBAL     |
| sv_setpvf_mg()           | NEED_sv_setpvf_mg           | NEED_sv_setpvf_mg_GLOBAL           |
| sv_setpvf_mg_nocontext() | NEED_sv_setpvf_mg_nocontext | NEED_sv_setpvf_mg_nocontext_GLOBAL |
| vload_module()           | NEED_vload_module           | NEED_vload_module_GLOBAL           |
| vnewSVpvf()              | NEED_vnewSVpvf              | NEED_vnewSVpvf_GLOBAL              |
| warnr()                  | NEED_warnr                  | NEED_warnr_GLOBAL                  |

To avoid namespace conflicts, you can change the namespace of the explicitly exported functions / variables using the C<DPPP\_NAMESPACE> macro. Just C<#define> the macro before including C<ppport.h>:

```
#define DPPP_NAMESPACE MyOwnNamespace_
#include "ppport.h"
```

The default namespace is C<DPPP\_>.

=back

The good thing is that most of the above can be checked by running F<ppport.h> on your source code. See the next section for details.

=head1 EXAMPLES

To verify whether F<ppport.h> is needed for your module, whether you should make any changes to your code, and whether any special defines should be used, F<ppport.h> can

be run as a Perl script to check your source code. Simply say:

```
perl ppport.h
```

The result will usually be a list of patches suggesting changes that should at least be acceptable, if not necessarily the most efficient solution, or a fix for all possible problems.

If you know that your XS module uses features only available in newer Perl releases, if you're aware that it uses C++ comments, and if you want all suggestions as a single patch file, you could use something like this:

```
perl ppport.h --compat-version=5.6.0 --cplusplus --patch=test.diff
```

If you only want your code to be scanned without any suggestions for changes, use:

```
perl ppport.h --nochanges
```

You can specify a different C<diff> program or options, using the C<--diff> option:

```
perl ppport.h --diff='diff -C 10'
```

This would output context diffs with 10 lines of context.

If you want to create patched copies of your files instead, use:

```
perl ppport.h --copy=.new
```

To display portability information for the C<newSVpv<pv> function, use:

```
perl ppport.h --api-info=newSVpv
```

Since the argument to C<--api-info> can be a regular expression, you can use

```
perl ppport.h --api-info=/_nomg$/
```

to display portability information for all C<\_nomg> functions or

```
perl ppport.h --api-info=./
```

to display information for all known API elements.

=head1 BUGS

If this version of F<ppport.h> is causing failure during the compilation of this module, please check if newer versions of either this module or C<Devel::PPPport> are available on CPAN before sending a bug report.

If F<ppport.h> was generated using the latest version of C<Devel::PPPport> and is causing failure of this module, please file a bug report using the CPAN Request Tracker at L<<http://rt.cpan.org/>>.

Please include the following information:

=over 4

=item 1.

The complete output from running "perl -V"

=item 2.

This file.

=item 3.

The name and version of the module you were trying to build.

=item 4.

A full log of the build that failed.

=item 5.

Any other information that you think could be relevant.

=back

For the latest version of this code, please get the C<Devel::PPPport> module from CPAN.

=back

Test::Simple will start by printing number of tests run in the form "1..M" (so "1..5" means you're going to run 5 tests). This strange format lets Test::Harness know how many tests you plan on running in case something goes horribly wrong.

If all your tests passed, Test::Simple will exit with zero (which is normal). If anything failed it will exit with how many failed. If you run less (or more) tests than you planned, the missing (or extras) will be considered failures. If no tests were ever run Test::Simple will throw a warning and exit with 255. If the test died, even after having successfully completed all its tests, it will still be

considered a failure and will exit with 255.

So the exit codes are...

```
0          all tests successful
255       test died
any other number  how many failed (including missing or extras)
```

If you fail more than 254 tests, it will be reported as 254.

This module is by no means trying to be a complete testing system. It's just to get you started. Once you're off the ground its recommended you look at [L<Test::More>](#).

=head1 EXAMPLE

Here's an example of a simple .t file for the fictional Film module.

```
use Test::Simple tests => 5;

use Film; # What you're testing.

my $btaste = Film->new({ Title => 'Bad Taste',
                      Director => 'Peter Jackson',
                      Rating => 'R',
                      NumExplodingSheep => 1
                      });
ok( defined($btaste) && ref $btaste eq 'Film', 'new() works' );

ok( $btaste->Title eq 'Bad Taste', 'Title() get' );
ok( $btaste->Director eq 'Peter Jackson', 'Director() get' );
ok( $btaste->Rating eq 'R', 'Rating() get' );
ok( $btaste->NumExplodingSheep == 1, 'NumExplodingSheep() get' );
```

It will produce output like this:

```
1..5
ok 1 - new() works
ok 2 - Title() get
ok 3 - Director() get
not ok 4 - Rating() get
# Failed test (t/film.t at line 14)
ok 5 - NumExplodingSheep() get
# Looks like you failed 1 tests of 5
```

Indicating the `Film::Rating()` method is broken.

## =head1 CAVEATS

Test::Simple will only report a maximum of 254 failures in its exit code. If this is a problem, you probably have a huge test script. Split it into multiple files. (Otherwise blame the Unix folks for using an unsigned short integer as the exit status).

Because VMS's exit codes are much, much different than the rest of the universe, and perl does horrible mangling to them that gets in my way, it works like this on VMS.

```
0  SS$_NORMAL    all tests successful
4  SS$_ABORT     something went wrong
```

Unfortunately, I can't differentiate any further.

## =head1 NOTES

Test::Simple is B<explicitly> tested all the way back to perl 5.004.

Test::Simple is thread-safe in perl 5.8.0 and up.

## =head1 HISTORY

This module was conceived while talking with Tony Bowden in his kitchen one night about the problems I was having writing some really complicated feature into the new Testing module. He observed that the main problem is not dealing with these edge cases but that people hate to write tests B<at all>. What was needed was a dead simple module that took all the hard work out of testing and was really, really easy to learn. Paul Johnson simultaneously had this idea (unfortunately, he wasn't in Tony's kitchen). This is it.

## =head1 SEE ALSO

=over 4

=item L<Test::More>

More testing functions! Once you outgrow Test::Simple, look at Test::More. Test::Simple is 100% forward compatible with Test::More (i.e. you can just use Test::More instead of Test::Simple in your programs and things will still work).

=item L<Test>

The original Perl testing module.

=item L<Test::Unit>

Elaborate unit testing.

=item L<Test::Inline>, L<SelfTest>

Embed tests in your code!

=item L<Test::Harness>

Interprets  
the output of your test program.

=head1 EXIT CODES

If all your tests passed, Test::Builder will exit with zero (which is normal). If anything failed it will exit with how many failed. If you run less (or more) tests than you planned, the missing (or extras) will be considered failures. If no tests were ever run Test::Builder will throw a warning and exit with 255. If the test died, even after having successfully completed all its tests, it will still be considered a failure and will exit with 255.

So the exit codes are...

|                  |   |
|------------------|---|
| 0                | all tests successful                          |
| 255              | test died                                     |
| any other number | how many failed (including missing or extras) |

If you fail more than 254 tests, it will be reported as 254.

=head1 THREADS

In perl 5.8.0 and later, Test::Builder is thread-safe. The test number is shared amongst all threads. This means if one thread sets the test number using current\_test() they will all be effected.

Test::Builder

is only thread-aware if threads.pm is loaded I<before>

Test::Builder.

## =head1 EXAMPLES

CPAN can provide the best examples. Test::Simple, Test::More, Test::Exception and Test::Differences all use Test::Builder.

=head1 NAME

threads::shared - Perl extension for sharing data structures between threads

=head1 VERSION

This document describes threads::shared version 1.43

=head1 SYNOPSIS

```
use threads;  
use threads::shared;
```

```
my $var :shared;  
my %hsh :shared;  
my @ary :shared;
```

```
my ($scalar, @array, %hash);  
share($scalar);  
share(@array);  
share(%hash);
```

```
$var = $scalar_value;
```

```
$var = $shared_ref_value;
$var = shared_clone($non_shared_ref_value);
$var = shared_clone({'foo' => [qw/foo bar baz/]});
```

```
$hsh{'foo'} = $scalar_value;
$hsh{'bar'} = $shared_ref_value;
$hsh{'baz'} = shared_clone($non_shared_ref_value);
$hsh{'quz'} = shared_clone([1..3]);
```

```
$ary[0] = $scalar_value;
$ary[1] = $shared_ref_value;
$ary[2] = shared_clone($non_shared_ref_value);
$ary[3] = shared_clone([ {}, [] ]);
```

```
{ lock(%hash); ... }
```

```
cond_wait($scalar);
cond_timedwait($scalar, time() + 30);
cond_broadcast(@array);
cond_signal(%hash);
```

```
my $lockvar :shared;
# condition var != lock var
cond_wait($var, $lockvar);
cond_timedwait($var, time()+30, $lockvar);
```

=head1 DESCRIPTION

By default, variables are private to each thread, and each newly created thread gets a private copy of each existing variable. This module allows you to share variables across different threads (and pseudo-forks on Win32). It is used together with the L<threads> module.

This module supports the sharing of the following data types only: scalars and scalar refs, arrays and array refs, and hashes and hash refs.

=head1 EXPORT

The following functions are exported by this module: C<share>, C<shared\_clone>, C<is\_shared>, C<cond\_wait>, C<cond\_timedwait>, C<cond\_signal> and C<cond\_broadcast>

Note that if this module is imported when L<threads> has not yet been loaded, then these functions all become no-ops. This makes it possible to write modules that will work in both threaded and non-threaded environments.

=head1 FUNCTIONS

=over

4

=item share VARIABLE

C<share> takes a variable and marks it as shared:

```
my ($scalar, @array, %hash);
share($scalar);
share(@array);
share(%hash);
```

C<share> will return the shared rvalue, but always as a reference.

Variables can also be marked as shared at compile time by using the C<:shared> attribute:

```
my ($var, %hash, @array) :shared;
```

Shared variables can only store scalars, refs of shared variables, or refs of shared data (discussed in next section):

```
my ($var, %hash, @array) :shared;
my $bork;
```

```
# Storing scalars
```

```
$var = 1;
$hash{ 'foo' } = 'bar';
$array[0] = 1.5;
```

```
# Storing shared refs
```

```
$var = \%hash;
$hash{ 'ary' } = \@array;
$array[1] = \$var;
```

```
# The following are errors:
```

```
# $var = $bork;           # ref of non-shared variable
# $hash{ 'bork' } = [];   # non-shared array ref
# push(@array, { 'x' => 1 }); # non-shared hash ref
```

=item shared\_clone REF

C<shared\_clone> takes a reference, and returns a shared version of its argument, performing a deep copy on any non-shared elements. Any shared elements in the argument are used as is (i.e., they are not cloned).

```
my $cpy = shared_clone({ 'foo' => [qw/foo bar baz/] });
```

Object status (i.e., the class an object is blessed into) is also cloned.

```
my $obj = { 'foo' => [qw/foo bar baz/]};  
bless($obj, 'Foo');  
my $cpy = shared_clone($obj);  
print(ref($cpy), "\n");    # Outputs 'Foo'
```

For cloning empty array or hash refs, the following may also be used:

```
$var = &share([]); # Same as $var = shared_clone([]);  
$var = &share({}); # Same as $var = shared_clone({});
```

Not all Perl data types can be cloned (e.g., globs, code refs). By default, `C<shared_clone>` will `L<croak|Carp>` if it encounters such items. To change this behaviour to a warning, then set the following:

```
$threads::shared::clone_warn = 1;
```

In this case, `C<undef>` will be substituted for the item to be cloned. If set to zero:

```
$threads::shared::clone_warn = 0;
```

then

the `C<undef>` substitution will be performed silently.

```
=item is_shared VARIABLE
```

`C<is_shared>` checks if the specified variable is shared or not. If shared, returns the variable's internal ID (similar to `L<refaddr()|Scalar::Util/"refaddr EXPR">`). Otherwise, returns `C<undef>`.

```
if (is_shared($var)) {  
    print("\$var is shared\n");  
} else {  
    print("\$var is not shared\n");  
}
```

When used on an element of an array or hash, `C<is_shared>` checks if the specified element belongs to a shared array or hash. (It does not check the contents of that element.)

```
my %hash :shared;  
if (is_shared(%hash)) {  
    print("\%hash is shared\n");  
}
```

```
$hash{'elem'} = 1;
if (is_shared($hash{'elem'})) {
    print("\$hash{'elem'} is in a shared hash\n");
}
```

=item lock VARIABLE

C<lock> places a B<advisory> lock on a variable until the lock goes out of scope. If the variable is locked by another thread, the C<lock> call will block until it's available. Multiple calls to C<lock> by the same thread from within dynamically nested scopes are safe -- the variable will remain locked until the outermost lock on the variable goes out of scope.

C<lock> follows references exactly I<one> level:

```
my %hash :shared;
my $ref = \%hash;
lock($ref);      # This is equivalent to lock(%hash)
```

Note that you cannot explicitly unlock a variable; you can only wait for the lock to go out of scope. This is most easily accomplished by locking the variable inside a block.

```
my $var :shared;
{
    lock($var);
    # $var is locked from here to the end of the block
    ...
}
# $var is now unlocked
```

As locks are advisory, they do not prevent data access or modification by another thread that does not itself attempt to obtain a lock on the variable.

You cannot lock the individual elements of a container variable:

```
my %hash :shared;
$hash{'foo'} = 'bar';
#lock($hash{'foo'});    # Error
lock(%hash);            # Works
```

If you need more fine-grained control over shared variable access, see L<Thread::Semaphore>.

=item cond\_wait VARIABLE

=item cond\_wait CONDVAR, LOCKVAR

The C<cond\_wait> function takes a B<locked> variable as a parameter, unlocks the variable, and blocks until another thread does a C<cond\_signal> or C<cond\_broadcast> for that same locked variable. The variable that C<cond\_wait> blocked on is re-locked after the C<cond\_wait> is satisfied. If there are multiple threads C<cond\_wait>ing on the same variable, all but one will re-block waiting to reacquire the lock on the variable. (So if you're only using C<cond\_wait> for synchronization, give up the lock as soon as possible). The two actions of unlocking the variable and entering the blocked wait state are atomic, the two actions of exiting from the blocked wait state and re-locking the variable are not.

In its second form, C<cond\_wait> takes a shared, B<unlocked> variable followed by a shared, B<locked> variable. The second variable is unlocked and thread execution suspended until another thread signals the first variable.

It is important to note that the variable can be notified even if no thread C<cond\_signal> or C<cond\_broadcast> on the variable. It is therefore important to check the value of the variable and go back to waiting if the requirement is not fulfilled. For example, to pause until a shared counter drops to zero:

```
{ lock($counter); cond_wait($counter) until $counter == 0; }
```

=item cond\_timedwait VARIABLE, ABS\_TIMEOUT

=item cond\_timedwait CONDVAR, ABS\_TIMEOUT, LOCKVAR

In its two-argument form, C<cond\_timedwait> takes a B<locked> variable and an absolute timeout in I<epoch> seconds (see L<time() in perlfunc|perlfunc/time> for more) as parameters, unlocks the variable, and blocks until the timeout is reached or another thread signals the variable. A false value is returned if the timeout is reached, and a true value otherwise. In either case, the variable is re-locked upon return.

Like C<cond\_wait>, this function may take a shared, B<locked> variable as an additional parameter; in this case the first parameter is an B<unlocked> condition variable protected by a distinct lock variable.

Again like C<cond\_wait>, waking up and reacquiring the lock are not atomic, and you should always check your desired condition after this function returns. Since the timeout is an absolute value, however, it does not have to be recalculated with each pass:

```
lock($var);
```

```

my $abs = time() + 15;
until ($ok = desired_condition($var)) {
    last if !cond_timedwait($var, $abs);
}
# we got it if $ok, otherwise we timed out!

```

=item cond\_signal VARIABLE

The C<cond\_signal> function takes a B<locked> variable as a parameter and unblocks one thread that's C<cond\_wait>ing on that variable. If more than one thread is blocked in a C<cond\_wait> on that variable, only one (and which one is indeterminate) will be unblocked.

If there are no threads blocked in a C<cond\_wait> on the variable, the signal is discarded. By always locking before signaling, you can (with care), avoid signaling before another thread has entered cond\_wait().

C<cond\_signal> will normally generate a warning if you attempt to use it on an unlocked variable. On the rare occasions where doing this may be sensible, you can suppress the warning with:

```
{ no warnings 'threads'; cond_signal($foo); }
```

=item cond\_broadcast VARIABLE

The C<cond\_broadcast> function works similarly to C<cond\_signal>. C<cond\_broadcast>, though, will unblock B<all> the threads that are blocked in a C<cond\_wait> on the locked variable, rather than only one.

=back

=head1 OBJECTS

L<threads::shared> exports a version of L<bless()|perlfunc/"bless REF"> that works on shared objects such that I<blessings> propagate across threads.

```

# Create a shared 'Foo' object
my $foo :shared = shared_clone({});
bless($foo, 'Foo');

```

```

# Create a shared 'Bar' object
my $bar :shared = shared_clone({});
bless($bar, 'Bar');

```

```

# Put 'bar' inside 'foo'
$foo->{'bar'} = $bar;

```

```

# Rebless the objects via a thread
threads->create(sub {
  # Rebless the outer object
  bless($foo, 'Yin');

  # Cannot directly rebless the inner object
  #bless($foo->{'bar'}, 'Yang');

  # Retrieve and rebless the inner object
  my $obj = $foo->{'bar'};
  bless($obj, 'Yang');
  $foo->{'bar'} = $obj;

})->join();

print(ref($foo),      "\n"); # Prints 'Yin'
print(ref($foo->{'bar'}), "\n"); # Prints 'Yang'
print(ref($bar),      "\n"); # Also prints 'Yang'

```

## =head1 NOTES

L<threads::shared> is designed to disable itself silently if threads are not available. This allows you to write modules and packages that can be used in both threaded and non-threaded applications.

If you want access to threads, you must C<use threads> before you C<use threads::shared>. L<threads> will emit a warning if you use it after L<threads::shared>.

## =head1 BUGS AND LIMITATIONS

When C<share> is used on arrays, hashes, array refs or hash refs, any data they contain will be lost.

```

my @arr = qw(foo bar baz);
share(@arr);
# @arr is now empty (i.e., == ());

# Create a 'foo' object
my $foo = { 'data' => 99 };
bless($foo, 'foo');

# Share the object
share($foo); # Contents are now wiped out
print("ERROR: \$foo is empty\n")
  if (! exists($foo->{'data'}));

```

Therefore, populate such variables B<after> declaring them as shared. (Scalar and scalar refs are not affected by this problem.)

It is often not wise to share an object unless the class itself has been written to support sharing. For example, an object's destructor may get called multiple times, once for each thread's scope exit. Another danger is that the contents of hash-based objects will be lost due to the above mentioned limitation. See F<examples/class.pl> (in the CPAN distribution of this module) for how to create a class that supports object sharing.

Destructors may not be called on objects if those objects still exist at global destruction time. If the destructors must be called, make sure there are no circular references and that nothing is referencing the objects, before the program ends.

Does not support C<splice> on arrays. Does not support explicitly changing array lengths via \$#array -- use C<push> and C<pop> instead.

Taking references to the elements of shared arrays and hashes does not autovivify the elements, and neither does slicing a shared array/hash over non-existent indices/keys autovivify the elements.

C<share()> allows you to C<< share(\$hashref->{key}) >> and C<< share(\$arrayref->[idx]) >> without giving any error message. But the C<< \$hashref->{key} >> or C<< \$arrayref->[idx] >> is B<not> shared, causing the error "lock can only be used on shared values" to occur when you attempt to C<< lock(\$hashref->{key}) >> or C<< lock(\$arrayref->[idx]) >> in another thread.

Using L<refaddr()|Scalar::Util/"refaddr EXPR"> is unreliable for testing whether or not two shared references are equivalent (e.g., when testing for circular references). Use L<is\_shared()/"is\_shared VARIABLE">, instead:

```
use threads;
use threads::shared;
use Scalar::Util qw(refaddr);

# If ref is shared, use threads::shared's internal ID.
# Otherwise, use refaddr().
my $addr1 = is_shared($ref1) || refaddr($ref1);
my $addr2 = is_shared($ref2) || refaddr($ref2);

if ($addr1 == $addr2) {
    # The refs are equivalent
}
```

L<each()|perlfunc/"each HASH"> does not work properly on shared references embedded in shared structures. For example:

```
my %foo :shared;
$foo{'bar'} = shared_clone({'a'=>'x', 'b'=>'y', 'c'=>'z'});

while (my ($key, $val) = each(%{$foo{'bar'}})) {
    ...
}
```

Either of the following will work instead:

```
my $ref = $foo{'bar'};
while (my ($key, $val) = each(%{$ref})) {
    ...
}

foreach my $key (keys(%{$foo{'bar'}})) {
    my $val = $foo{'bar'}{$key};
    ...
}
```

This module supports dual-valued variables created using

L<dualvar() from

Scalar::Util|Scalar::Util/"dualvar NUM, STRING">. However, while C<\$!> acts like a dualvar, it is implemented as a tied SV. To propagate its value, use the follow construct, if needed:

```
my $errno :shared = dualvar($!, $!);
```

```

No license file was found, but licenses were detected in source scan.

This is the perl5 TimeDate distribution. It requires perl version 5.003 or later

This distribution replaces my earlier GetDate distribution, which was only a date parser. The date parser contained in this distribution is far superior to the yacc based parser, and a \*lot\* faster.

The parser contained here will only parse absolute dates, if you want a date parser that can parse relative dates then take a look at the Time modules by David Muir on CPAN.

You install the library by running these commands:

```
perl Makefile.PL
make
make test
make install
```

Please report any bugs/suggestions to <gbarr@pobox.com>

=encoding utf8

=head1 NAME

Date::Language::Bulgarian - localization for Date::Format

=head1 DESCRIPTION

This is Bulgarian localization for Date::Format.

It is important to note that this module source code is in utf8.

All strings which it outputs are in utf8, so it is safe to use it currently only with English. You are left alone to try and convert the output when using different Date::Language::\* in the same application. This should be addressed in the future.

## =head1 SYNOPSIS

```
use strict;
use warnings;
use Date::Language;
local $\=$/;
my $template = '%a %b %e %T %Y (%Y-%m-%d %H:%M:%S)';
my $time=1290883821; #or just use time();
my @lt = localtime($time);
my %languages = qw(English GMT German EEST Bulgarian EET);
binmode(select,':utf8');

foreach my $l(keys %languages){
    my $lang = Date::Language->new($l);
    my $zone = $languages{$l};
    print $/. "$l
$zone";
    print $lang->time2str($template, $time);
    print $lang->time2str($template, $time, $zone);

    print $lang->strftime($template, \@lt);
}
```

=head1 NAME

Date::Language::Hungarian - Magyar format for Date::Format

=head1 SYNOPSIS

```
my $lang = Date::Language->new('Hungarian');  
print $lang->time2str("%a %b %e %T %Y", time);
```

```
@lt = localtime(time);  
print $lang->time2str($template, time);  
print $lang->strftime($template, @lt);
```

```
print $lang->time2str($template, time, $zone);  
print $lang->strftime($template, @lt, $zone);
```

```
print $lang->ctime(time);  
print $lang->asctime(@lt);
```

```
print $lang->ctime(time, $zone);  
print $lang->asctime(@lt, $zone);
```

See L<Date::Format>.

=head1 NAME

HTTP::Config - Configuration for request and response objects

=head1 SYNOPSIS

```
use HTTP::Config;
my $c = HTTP::Config->new;
$c->add(m_domain => ".example.com", m_scheme => "http", verbose => 1);

use HTTP::Request;
my $request = HTTP::Request->new(GET => "http://www.example.com");

if (my @m = $c->matching($request)) {
    print "Yadayada\n" if $m[0]->{verbose};
}
```

=head1 DESCRIPTION

An C<HTTP::Config> object is a list of entries that can be matched against request or request/response pairs. Its purpose is to hold configuration data that can be looked up given a request or response object.

Each configuration entry is a hash. Some keys specify matching to occur against attributes of request/response objects. Other keys can be used to hold user data.

The following methods are provided:

=over 4

=item \$conf = HTTP::Config->new

Constructs a new empty C<HTTP::Config> object and returns it.

=item

\$conf->entries

Returns the list of entries in the configuration object.

In scalar context returns the number of entries.

```
=item $conf->empty
```

Return true if there are no entries in the configuration object.

This is just a shorthand for `C<< not $conf->entries >>`.

```
=item $conf->add( %matchspec, %other )
```

```
=item $conf->add( \%entry )
```

Adds a new entry to the configuration.

You can either pass separate key/value pairs or a hash reference.

```
=item $conf->remove( %spec )
```

Removes (and returns) the entries that have matches for all the key/value pairs in %spec.

If %spec is empty this will match all entries; so it will empty the configuration object.

```
=item $conf->matching( $uri, $request, $response )
```

```
=item $conf->matching( $uri )
```

```
=item $conf->matching( $request )
```

```
=item $conf->matching( $response )
```

Returns the entries that match the given \$uri, \$request and \$response triplet.

If called with a single \$request object then the \$uri is obtained by calling its 'uri\_canonical' method.

If called

with a single \$response object, then the request object is obtained by calling its 'request' method;  
and then the \$uri is obtained as if a single \$request was provided.

The entries are returned with the most specific matches first.

In scalar context returns the most specific match or `C<undef>` in none match.

```
=item $conf->add_item( $item, %matchspec )
```

```
=item $conf->remove_items( %spec )
```

```
=item $conf->matching_items( $uri, $request, $response )
```

Wrappers that hides the entries themselves.

```
=back
```

=head2 Matching

The following keys on a configuration entry specify matching. For all of these you can provide an array of values instead of a single value. The entry matches if at least one of the values in the array matches.

Entries that require match against a response object attribute will never match unless a response object was provided.

=over

=item m\_scheme => \$scheme

Matches if the URI uses the specified scheme; e.g. "http".

=item m\_secure => \$bool

If \$bool is TRUE; matches if the URI uses a secure scheme. If \$bool is FALSE; matches if the URI does not use a secure scheme. An example of a secure scheme is "https".

=item m\_host\_port => "\$hostname:\$port"

Matches if the URI's host\_port method return the specified value.

=item m\_host => \$hostname

Matches if the URI's host method returns the specified value.

=item m\_port => \$port

Matches if the URI's port method returns the specified value.

=item m\_domain => ".\$domain"

Matches if the URI's host method return a value that within the given domain. The hostname "www.example.com" will for instance match the domain ".com".

=item m\_path => \$path

Matches if the URI's path method returns the specified value.

=item m\_path\_prefix => \$path

Matches if the URI's path is the specified path or has the specified path as prefix.

=item m\_path\_match => \$Regexp

Matches if the regular expression matches the URI's path. Eg. qr/\html\$/.

=item m\_method => \$method

Matches if the request method matches the specified value. Eg. "GET" or "POST".

=item m\_code => \$digit

=item m\_code => \$status\_code

Matches if the response status code matches. If a single digit is specified; matches for all response status codes beginning with that digit.

=item m\_proxy => \$url

Matches if the request is to be sent to the given Proxy server.

=item m\_media\_type => "\*/\*"

=item m\_media\_type => "text/\*"

=item m\_media\_type => "html"

=item m\_media\_type => "xhtml"

=item m\_media\_type => "text/html"

Matches if the response media type matches.

With a value of "html" matches if \$response->content\_is\_html returns TRUE.

With a value of "xhtml" matches if \$response->content\_is\_xhtml returns TRUE.

=item m\_uri\_\_I<\$method> => undef

Matches if the URI object provides the method.

=item m\_uri\_\_I<\$method> => \$string

Matches if the URI's \$method method returns the given value.

=item m\_header\_\_I<\$field> => \$string

Matches if either the request or the response have a header \$field with the given value.

=item m\_response\_attr\_\_I<\$key>

=> undef

=item m\_response\_attr\_\_I<\$key> => \$string

Matches if the response object has that key, or the entry has the given value.

=head1 NAME

HTTP::Message - HTTP style message (base class)

=head1 SYNOPSIS

```
use base 'HTTP::Message';
```

=head1 DESCRIPTION

An C<HTTP::Message> object contains some headers and a content body.  
The following methods are available:

=over 4

=item \$mess = HTTP::Message->new

=item \$mess = HTTP::Message->new( \$headers )

=item \$mess = HTTP::Message->new( \$headers, \$content )

This constructs a new message object. Normally you would want construct C<HTTP::Request> or C<HTTP::Response> objects instead.

The optional \$header argument should be a reference to an C<HTTP::Headers> object or a plain array reference of key/value pairs. If an C<HTTP::Headers> object is provided then a copy of it will be embedded into the constructed message, i.e. it will not be owned and can be modified afterwards without affecting the message.

The optional \$content argument should be a string of bytes.

```
=item $mess = HTTP::Message->parse(  
$str )
```

This constructs a new message object by parsing the given string.

```
=item $mess->headers
```

Returns the embedded C<HTTP::Headers> object.

```
=item $mess->headers_as_string
```

```
=item $mess->headers_as_string( $eol )
```

Call the as\_string() method for the headers in the message. This will be the same as

```
$mess->headers->as_string
```

but it will make your program a whole character shorter :-)

```
=item $mess->content
```

```
=item $mess->content( $bytes )
```

The content() method sets the raw content if an argument is given. If no argument is given the content is not touched. In either case the original raw content is returned.

Note that the content should be a string of bytes. Strings in perl can contain characters outside the range of a byte. The C<Encode> module can be used to turn such strings into a string of bytes.

```
=item $mess->add_content( $bytes )
```

The add\_content() methods appends more data bytes to the end of the current content buffer.

```
=item $mess->add_content_utf8( $string )
```

The `add_content_utf8()` method appends the UTF-8 bytes representing the string to the end of the current content buffer.

```
=item $mess->content_ref
```

```
=item $mess->content_ref( \%bytes )
```

The `content_ref()` method will return a reference to content buffer string. It can be more efficient to access the content this way if the content is huge, and it can even be used for direct manipulation of the content, for instance:

```
/${res->content_ref} =~ s/\bfoo\b/bar/g;
```

This example would modify the content buffer in-place.

If an argument is passed it will setup the content to reference some external source. The `content()` and `add_content()` methods will automatically dereference scalar references passed this way. For other references `content()` will return the reference itself and `add_content()` will refuse to do anything.

```
=item $mess->content_charset
```

This returns the charset used by the content in the message. The charset is either found as the charset attribute of the `C<Content-Type>` header or by guessing.

See

L<<http://www.w3.org/TR/REC-html40/charset.html#spec-char-encoding>> for details about how charset is determined.

```
=item $mess->decoded_content( %options )
```

Returns the content with any `C<Content-Encoding>` undone and for textual content the raw content encoded to Perl's Unicode strings. If the `C<Content-Encoding>` or `C<charset>` of the message is unknown this method will fail by returning `C<undef>`.

The following options can be specified.

```
=over
```

```
=item C<charset>
```

This override the charset parameter for text content. The value C<none> can used to suppress decoding of the charset.

=item C<default\_charset>

This override the default charset guessed by content\_charset() or if that fails "ISO-8859-1".

=item C<alt\_charset>

If decoding fails because the charset specified in the Content-Type header isn't recognized by Perl's Encode module, then try decoding using this charset instead of failing. The C<alt\_charset> might be specified as C<none> to simply return the string without any decoding of charset as alternative.

=item C<charset\_strict>

Abort decoding if malformed characters is found in the content. By default you get the substitution character ("\x{FFFD}") in place of malformed characters.

=item C<raise\_error>

If TRUE then raise an exception if not able to decode content. Reason might be that the specified C<Content-Encoding> or C<charset> is not supported. If this option is FALSE, then decoded\_content() will return C<undef> on errors, but will still set \$@.

=item C<ref>

If TRUE then a reference to decoded content is returned. This might be more efficient in cases where the decoded content is identical to the raw content as no data copying is required in this case.

=back

=item \$mess->decodable

=item HTTP::Message::decodable()

This returns the encoding identifiers that decoded\_content() can process. In scalar context returns a comma separated string of identifiers.

This value is suitable for initializing the C<Accept-Encoding> request header

field.

=item \$mess->decode

This method tries to replace the content of the message with the decoded version and removes the C<Content-Encoding> header. Returns TRUE if successful and FALSE if not.

If the message does not have a C<Content-Encoding> header this method does nothing and returns TRUE.

Note that the content of the message is still bytes after this method has been called and you still need to call `decoded_content()` if you want to process its content as a string.

=item \$mess->encode( \$encoding, ... )

Apply the given encodings to the content of the message. Returns TRUE if successful. The "identity" (non-)encoding is always supported; other currently supported encodings, subject to availability of required additional modules, are "gzip", "deflate", "x-bzip2" and "base64".

A successful call to this function will set the C<Content-Encoding> header.

Note that C<multipart/\*> or C<message/\*> messages can't be encoded and this method will croak if you try.

=item \$mess->parts

=item

\$mess->parts( @parts )

=item \$mess->parts( \@parts )

Messages can be composite, i.e. contain other messages. The composite messages have a content type of C<multipart/\*> or C<message/\*>. This method give access to the contained messages.

The argumentless form will return a list of C<HTTP::Message> objects. If the content type of \$msg is not C<multipart/\*> or C<message/\*> then this will return the empty list. In scalar context only the first object is returned. The returned message parts should be regarded as read-only (future versions of this library might make it possible to modify the parent by modifying the parts).

If the content type of \$msg is C<message/\*> then there will only be one part returned.

If the content type is C<message/http>, then the return value will be either an C<HTTP::Request> or an C<HTTP::Response> object.

If a @parts argument is given, then the content of the message will be modified. The array reference form is provided so that an empty list can be provided. The @parts array should contain C<HTTP::Message> objects. The @parts objects are owned by \$mess after this call and should not be modified or made part of other messages.

When updating the message with this method and the old content type of \$mess is not C<multipart/\*> or C<message/\*>, then the content type is set to C<multipart/mixed> and all other content headers are cleared.

This method will croak if the content type is C<message/\*> and more than one part is provided.

```
=item $mess->add_part( $part )
```

This will add a part to a message. The \$part argument should be another C<HTTP::Message> object. If the previous content type of \$mess is not C<multipart/\*> then the old content (together with all content headers) will be made part #1 and the content type made C<multipart/mixed> before the new part is added. The \$part object is owned by \$mess after this call and should not be modified or made part of other messages.

There is no return value.

```
=item $mess->clear
```

Will

clear the headers and set the content to the empty string. There is no return value

```
=item $mess->protocol
```

```
=item $mess->protocol( $proto )
```

Sets the HTTP protocol used for the message. The protocol() is a string like C<HTTP/1.0> or C<HTTP/1.1>.

```
=item $mess->clone
```

Returns a copy of the message object.

```
=item $mess->as_string
```

=item \$mess->as\_string( \$eol )

Returns the message formatted as a single string.

The optional \$eol parameter specifies the line ending sequence to use. The default is "\n". If no \$eol is given then as\_string will ensure that the returned string is newline terminated (even when the message content is not). No extra newline is appended if an explicit \$eol is passed.

=item \$mess->dump( %opt )

Returns the message formatted as a string. In void context print the string.

This differs from C<< \$mess->as\_string >> in that it escapes the bytes of the content so that it's safe to print them and it limits how much content to print. The escapes syntax used is the same as for Perl's double quoted strings. If there is no content the string "(no content)" is shown in its place.

Options to influence the output can be passed as key/value pairs. The following options are recognized:

=over

=item maxlength => \$num

How much of the content to show. The default is 512. Set this to 0 for unlimited.

If the content is longer then the string is chopped at the limit and the string "... \n(### more bytes not shown)" appended.

=item no\_content => \$str

Replaces the "(no content)" marker.

=item prefix => \$str

A string that will be prefixed to each line of the dump.

=back

=back

All methods unknown to C<HTTP::Message> itself are delegated to the

C<HTTP::Headers> object that is part of every message. This allows convenient access to these methods. Refer to L<HTTP::Headers> for details of these methods:

```
$mess->header( $field => $val )
$mess->push_header( $field => $val )
$mess->init_header( $field => $val )
$mess->remove_header(
$field )
$mess->remove_content_headers
$mess->header_field_names
$mess->scan( \&doit )
```

```
$mess->date
$mess->expires
$mess->if_modified_since
$mess->if_unmodified_since
$mess->last_modified
$mess->content_type
$mess->content_encoding
$mess->content_length
$mess->content_language
$mess->title
$mess->user_agent
$mess->server
$mess->from
$mess->referer
$mess->www_authenticate
$mess->authorization
$mess->proxy_authorization
$mess->authorization_basic
$mess->proxy_authorization_basic
```

The HTTP-Message distribution contains classes useful for representing the messages passed in HTTP style communication. These are classes representing

requests, responses and the headers contained within them.

The following classes are provided:

HTTP::Message     base class (what's common between requests and responses)  
- HTTP::Request    request on a resource (subclass of message)  
- HTTP::Response   response from the resource (subclass of message)  
HTTP::Headers     headers embedded in messages

Other related modules:

HTTP::Config      configuration of request/response handling  
HTTP::Headers::Util  helper functions for parsing of HTTP header values  
HTTP::Request::Common  helper functions for constructing requests  
HTTP::Status       symbolic names for the HTTP response status codes

This library is free software; you can redistribute it and/or modify it under the same terms as Perl itself.

=head1 NAME

HTTP::Response - HTTP style response message

=head1 SYNOPSIS

Response objects are returned by the request() method of the C<LWP::UserAgent>:

```
# ...  
$response = $ua->request($request)  
if ($response->is_success) {  
    print $response->decoded_content;  
}  
else {  
    print STDERR $response->status_line, "\n";  
}
```

=head1 DESCRIPTION

The C<HTTP::Response> class encapsulates HTTP style responses. A response consists of a response line, some headers, and a content

body. Note that the LWP library uses HTTP style responses even for non-HTTP protocol schemes. Instances of this class are usually created and returned by the request() method of an C<LWP::UserAgent> object.

C<HTTP::Response> is a subclass of C<HTTP::Message> and therefore inherits its methods. The following additional methods are available:

=over 4

=item \$r = HTTP::Response->new( \$code )

=item \$r = HTTP::Response->new(  
\$code, \$msg )

=item \$r = HTTP::Response->new( \$code, \$msg, \$header )

=item \$r = HTTP::Response->new( \$code, \$msg, \$header, \$content )

Constructs a new C<HTTP::Response> object describing a response with response code \$code and optional message \$msg. The optional \$header argument should be a reference to an C<HTTP::Headers> object or a plain array reference of key/value pairs. The optional \$content argument should be a string of bytes. The meanings of these arguments are described below.

=item \$r = HTTP::Response->parse( \$str )

This constructs a new response object by parsing the given string.

=item \$r->code

=item \$r->code( \$code )

This is used to get/set the code attribute. The code is a 3 digit number that encode the overall outcome of an HTTP response. The C<HTTP::Status> module provide constants that provide mnemonic names for the code attribute.

=item \$r->message

=item \$r->message( \$message )

This is used to get/set the message attribute. The message is a short human readable single line string that explains the response code.

=item \$r->header( \$field )

=item \$r->header( \$field => \$value )

This is used to get/set header values and it is inherited from C<HTTP::Headers> via C<HTTP::Message>. See L<HTTP::Headers> for details and other similar methods that can be used to access the headers.

=item \$r->content

=item \$r->content( \$bytes )

This is used to get/set the raw content and it is inherited from the C<HTTP::Message> base class. See L<HTTP::Message> for details and other methods that can be used to access the content.

=item \$r->decoded\_content( %options )

This will return the content after any C<Content-Encoding> and charsets have been decoded. See L<HTTP::Message> for details.

=item \$r->request

=item \$r->request( \$request )

This is used to get/set the request attribute. The request attribute is a reference to the the request that caused this response. It does not have to be the same request passed to the \$ua->request() method, because there might have been redirects and authorization retries in between.

=item \$r->previous

=item \$r->previous( \$response )

This is used to get/set the previous attribute. The previous attribute is used to link together chains of responses. You get chains of responses if the first response is redirect or unauthorized. The value is C<undef> if this is the first response in a chain.

Note that the method \$r->redirects is provided as a more convenient way to access the response chain.

=item \$r->status\_line

Returns the string "E<lt>code> E<lt>message>". If the message attribute is not set then the official name of E<lt>code> (see L<HTTP::Status>)

is substituted.

=item \$r->base

Returns the base URI for this response. The return value will be a reference to a URI object.

The base URI is obtained from one the following sources (in priority order):

=over 4

=item 1.

Embedded in the document content, for instance <BASE HREF="..."> in HTML documents.

=item 2.

A "Content-Base:"  
or a "Content-Location:" header in the response.

For backwards compatibility with older HTTP implementations we will also look for the "Base:" header.

=item 3.

The URI used to request this response. This might not be the original URI that was passed to \$ua->request() method, because we might have received some redirect responses first.

=back

If none of these sources provide an absolute URI, undef is returned.

When the LWP protocol modules produce the HTTP::Response object, then any base URI embedded in the document (step 1) will already have initialized the "Content-Base:" header. This means that this method only performs the last 2 steps (the content is not always available either).

=item \$r->filename

Returns a filename for this response. Note that doing sanity checks on the returned filename (eg. removing characters that cannot be used on the target filesystem where the filename would be used, and laundering it for security purposes) are the caller's responsibility; the

only related thing done by this method is that it makes a simple attempt to return a plain filename with no preceding path segments.

The filename is obtained from one the following sources (in priority order):

=over 4

=item 1.

A "Content-Disposition:" header in the response. Proper decoding of RFC 2047 encoded filenames requires the C<MIME::QuotedPrint> (for "Q" encoding), C<MIME::Base64> (for "B" encoding), and C<Encode> modules.

=item 2.

A "Content-Location:" header in the response.

=item 3.

The URI used to request this response. This might not be the original URI that was passed to \$ua->request() method, because we might have received some redirect responses first.

=back

If a filename cannot be derived from any of these sources, undef is returned.

=item \$r->as\_string

=item \$r->as\_string( \$eol )

Returns a textual representation of the response.

=item \$r->is\_info

=item \$r->is\_success

=item \$r->is\_redirect

=item \$r->is\_error

These methods indicate if the response was informational, successful, a redirection, or an error. See L<HTTP::Status> for the meaning of these.

=item \$r->error\_as\_HTML

Returns a string containing a complete HTML document indicating what error occurred. This method should only be called when `$r->is_error` is TRUE.

=item `$r->redirects`

Returns the list of redirect responses that lead up to this response by following the `$r->previous` chain. The list order is oldest first.

In scalar context return the number of redirect responses leading up to this one.

=item `$r->current_age`

Calculates the "current age" of the response as specified by RFC 2616 section 13.2.3. The age of a response is the time since it was sent by the origin server. The returned value is a number representing the age in seconds.

=item `$r->freshness_lifetime( %opt )`

Calculates the "freshness lifetime" of the response as specified by RFC 2616 section 13.2.4. The "freshness lifetime" is the length of time between the generation of a response and its expiration time.

The returned value is the number of seconds until expiry.

If the response does not contain an "Expires" or a "Cache-Control" header, then this function will apply some simple heuristic based on the "Last-Modified" header to determine a suitable lifetime. The following options might be passed to control the heuristics:

=over

=item `heuristic_expiry => $bool`

If passed as a FALSE value, don't apply heuristics and just return C<undef> when "Expires" or "Cache-Control" is lacking.

=item `h_lastmod_fraction => $num`

This number represent the fraction of the difference since the "Last-Modified" timestamp to make the expiry time. The default is C<0.10>, the suggested typical setting of 10% in RFC 2616.

=item `h_min => $sec`

This is the lower limit of the heuristic expiry age to use. The default is C<60> (1 minute).

=item h\_max => \$sec

This is the upper limit of the heuristic expiry age to use. The default is C<86400> (24 hours).

=item h\_default => \$sec

This is the expiry age to use when nothing else applies. The default is C<3600> (1 hour) or "h\_min" if greater.

=back

=item \$r->is\_fresh( %opt )

Returns TRUE if the response is fresh, based on the values of freshness\_lifetime() and current\_age(). If the response is no longer fresh, then it has to be re-fetched or re-validated by the origin server.

Options might be passed to control expiry heuristics, see the description of freshness\_lifetime().

=item \$r->fresh\_until( %opt )

Returns the time (seconds since epoch) when this entity is no longer fresh.

Options might be passed to control expiry heuristics, see the description of freshness\_lifetime().

=back

=head1 NAME

HTTP::Request - HTTP style request message

=head1 SYNOPSIS

```
require HTTP::Request;
$request = HTTP::Request->new(GET => 'http://www.example.com/');
```

and usually used like this:

```
$ua = LWP::UserAgent->new;
$response = $ua->request($request);
```

=head1 DESCRIPTION

C<HTTP::Request> is a class encapsulating HTTP style requests, consisting of a request line, some headers, and a content body. Note that the LWP library uses HTTP style requests even for non-HTTP protocols. Instances of this class are usually passed to the request() method of an C<LWP::UserAgent> object.

C<HTTP::Request> is a subclass of C<HTTP::Message> and therefore inherits its methods. The following additional methods are available:

=over 4

=item \$r = HTTP::Request->new( \$method, \$uri )

=item \$r = HTTP::Request->new( \$method, \$uri, \$header )

=item \$r = HTTP::Request->new( \$method, \$uri, \$header, \$content )

Constructs a new C<HTTP::Request> object describing a request on the object \$uri using method \$method. The \$method argument must be a string. The \$uri argument can be either a string, or a reference to a C<URI> object. The optional \$header argument should be a reference to an C<HTTP::Headers> object or a plain array reference of key/value pairs. The optional \$content argument should be a string of bytes.

=item \$r = HTTP::Request->parse( \$str )

This constructs a new request object by parsing the given string.

=item \$r->method

=item \$r->method( \$val )

This is used to get/set the method attribute. The method should be a short string like "GET", "HEAD", "PUT" or "POST".

=item \$r->uri

=item \$r->uri( \$val )

This is used to get/set the uri attribute. The \$val can be a reference to a URI object or a plain string. If a string is given, then it should be parseable as an absolute URI.

=item \$r->header( \$field )

=item \$r->header( \$field => \$value )

This is used to get/set header values and it is inherited from `C<HTTP::Headers>` via `C<HTTP::Message>`. See `L<HTTP::Headers>` for details and other similar methods that can be used to access the headers.

=item \$r->accept\_decodable

This will set the `C<Accept-Encoding>` header to the list of encodings that `decoded_content()` can decode.

=item \$r->content

=item \$r->content( \$bytes )

This is used to get/set the content and it is inherited from the `C<HTTP::Message>` base class. See `L<HTTP::Message>` for details and other methods that can be used to access the content.

Note that the content should be a string of bytes. Strings in perl can contain characters outside the range of a byte. The `C<Encode>` module can be used to turn such strings into a string of bytes.

=item \$r->as\_string

=item \$r->as\_string( \$eol )

Method returning a textual representation of the request.

=head1 NAME

HTTP::Headers::Util - Header value parsing utility functions

=head1 SYNOPSIS

```
use HTTP::Headers::Util qw(split_header_words);  
@values = split_header_words($h->header("Content-Type"));
```

=head1 DESCRIPTION

This module provides a few functions that helps parsing and  
construction of valid HTTP header values. None of the functions are  
exported by default.

The following functions are available:

=over 4

=item split\_header\_words( @header\_values )

This function will parse the header values given as argument into a  
list of anonymous arrays containing key/value pairs. The function  
knows how to deal with ",", ";", and "=" as well as quoted values after  
"=". A list of space separated tokens are parsed as if they were

separated by ";".

If the @header\_values passed as argument contains multiple values, then they are treated as if they were a single value separated by comma ",".

This means that this function is useful for parsing header fields that follow this syntax (BNF as from the HTTP/1.1 specification, but we relax the requirement for tokens).

```
headers      = #header
header       = (token | parameter) *( [";"] (token | parameter))
```

```
token        = 1*<any CHAR except CTLs or separators>
separators   = "(" | ")" | "<" | ">" | "@"
              | "," | ";" | ":" | "\" | "<">
              | "/" | "[" | "]" | "?" | "="
              | "{" | "}" | SP | HT
```

```
quoted-string = (<"> *(qdtxt | quoted-pair ) <"> )
qdtxt         = <any TEXT except <">>
quoted-pair   = "\" CHAR
```

```
parameter    = attribute "=" value
attribute     = token
value        = token | quoted-string
```

Each I<header> is represented by an anonymous array of key/value pairs. The keys will be all be forced to lower case.

The value for a simple token (not part of a parameter) is C<undef>.

Syntactically incorrect headers will not necessarily be parsed

as you would want.

This is easier to describe with some examples:

```
split_header_words('foo="bar"; port="80,81"; DISCARD, BAR=baz');
split_header_words('text/html; charset="iso-8859-1"');
split_header_words('Basic realm="\\"foo\\"bar\\"");
```

will return

```
[foo=>'bar', port=>'80,81', discard=> undef], [bar=>'baz' ]
['text/html' => undef, charset => 'iso-8859-1']
[basic => undef, realm => "\"foo\\"bar\\""]
```

If you don't want the function to convert tokens and attribute keys to

lower case you can call it as `C<_split_header_words>` instead (with a leading underscore).

```
=item join_header_words( @arrays )
```

This will do the opposite of the conversion done by `split_header_words()`. It takes a list of anonymous arrays as arguments (or a list of key/value pairs) and produces a single header value. Attribute values are quoted if needed.

Example:

```
join_header_words(["text/plain" => undef, charset => "iso-8859/1"]);
join_header_words("text/plain" => undef, charset => "iso-8859/1");
```

will

both return the string:

```
text/plain; charset="iso-8859/1"
```

```
=back

```
=head1 NAME
```

```
HTTP::Request::Common - Construct common HTTP::Request objects
```

```
=head1 SYNOPSIS
```

```
use HTTP::Request::Common;
$ua = LWP::UserAgent->new;
$ua->request(GET 'http://www.sn.no/');
$ua->request(POST 'http://somewhere/foo', [foo => bar, bar => foo]);
```

```
=head1 DESCRIPTION
```

This module provide functions that return newly created C<HTTP::Request> objects. These functions are usually more convenient to use than the standard C<HTTP::Request> constructor for the most common requests. The following functions are provided:

=over 4

=item GET \$url

=item GET \$url, Header => Value,...

The GET() function returns an C<HTTP::Request> object initialized with the "GET" method and the specified URL. It is roughly equivalent to the following call

```
HTTP::Request->new(  
  GET => $url,  
  HTTP::Headers->new(Header => Value,...),  
)
```

but is less cluttered. What is different is that a header named C<Content> will initialize the content part of the request instead of setting a header field. Note that GET requests should normally not have a content, so this hack makes more sense for the PUT() and POST() functions described below.

The get(...) method of C<LWP::UserAgent> exists as a shortcut for \$ua->request(GET ...).

=item HEAD \$url

=item HEAD \$url, Header => Value,...

Like GET() but the method in the request is "HEAD".

The head(...) method of "LWP::UserAgent" exists as a shortcut for \$ua->request(HEAD ...).

=item PUT \$url

=item PUT \$url, Header => Value,...

=item PUT \$url, Header => Value,..., Content => \$content

Like GET() but the method in the request is "PUT".

The content of the request can be specified using the "Content"

pseudo-header. This steals a bit of the header field namespace as there is no way to directly specify a header that is actually called "Content". If you really need this you must update the request returned in a separate statement.

```
=item DELETE $url
```

```
=item DELETE  
$url, Header => Value,...
```

Like GET() but the method in the request is "DELETE". This function is not exported by default.

```
=item POST $url
```

```
=item POST $url, Header => Value,...
```

```
=item POST $url, $form_ref, Header => Value,...
```

```
=item POST $url, Header => Value,..., Content => $form_ref
```

```
=item POST $url, Header => Value,..., Content => $content
```

This works mostly like PUT() with "POST" as the method, but this function also takes a second optional array or hash reference parameter \$form\_ref. As for PUT() the content can also be specified directly using the "Content" pseudo-header, and you may also provide the \$form\_ref this way.

The \$form\_ref argument can be used to pass key/value pairs for the form content. By default we will initialize a request using the C<application/x-www-form-urlencoded> content type. This means that you can emulate an HTML E<lt>form> POSTing like this:

```
POST 'http://www.perl.org/survey.cgi',  
  [ name => 'Gisle Aas',  
    email => 'gisle@aas.no',  
    gender => 'M',  
    born => '1964',  
    perc => '3%',  
  ];
```

This will create an HTTP::Request object that looks like this:

```
POST http://www.perl.org/survey.cgi  
Content-Length: 66  
Content-Type: application/x-www-form-urlencoded
```

```
name=Gisle%20Aas&email=gisle%40aas.no&gender=M&born=1964&perc=3%25
```

Multivalued form fields can be specified by either repeating the field name or by passing the value as an array reference.

The POST method also supports the C<multipart/form-data> content used for I<Form-based File Upload> as specified in RFC 1867. You trigger this content format by specifying a content type of C<'form-data'> as one of the request headers. If one of the values in the \$form\_ref is an array reference, then it is treated as a file part specification with the following interpretation:

```
[ $file, $filename, Header => Value... ]  
[ undef, $filename, Header => Value,..., Content => $content ]
```

The first value in the array (\$file) is the name of a file to open.

This file will be read and its content placed in the request. The routine will croak if the file can't be opened. Use an C<undef> as \$file value if you want to specify the content directly with a C<Content> header. The \$filename is the filename to report in the request. If this value is undefined, then the basename of the \$file will be used. You can specify an empty string as \$filename if you want to suppress sending the filename when you provide a \$file value.

If a \$file is provided by no C<Content-Type> header, then C<Content-Type> and C<Content-Encoding> will be filled in automatically with the values returned by LWP::MediaTypes::guess\_media\_type()

Sending my F<~/profile> to the survey used as example above can be achieved by this:

```
POST 'http://www.perl.org/survey.cgi',  
  Content_Type => 'form-data',  
  Content      => [ name => 'Gisle Aas',  
                  email => 'gisle@aas.no',  
                  gender => 'M',  
  
                  born => '1964',  
                  init => ["$ENV{HOME}/.profile"],  
                  ]
```

This will create an HTTP::Request object that almost looks this (the boundary and the content of your F<~/profile> is likely to be different):

```
POST http://www.perl.org/survey.cgi  
Content-Length: 388
```

Content-Type: multipart/form-data; boundary="6G+f"

--6G+f

Content-Disposition: form-data; name="name"

Gisle Aas

--6G+f

Content-Disposition: form-data; name="email"

gisle@aas.no

--6G+f

Content-Disposition: form-data; name="gender"

M

--6G+f

Content-Disposition: form-data; name="born"

1964

--6G+f

Content-Disposition: form-data; name="init"; filename=".profile"

Content-Type: text/plain

PATH=/local/perl/bin:\$PATH

export PATH

--6G+f--

If you set the `$DYNAMIC_FILE_UPLOAD` variable (exportable) to some TRUE value, then you get back a request object with a subroutine closure as the content attribute. This subroutine will read the content of any files on demand and return it in suitable chunks. This allow you to upload arbitrary big files without using lots of memory. You can even upload infinite files like `F</dev/audio>` if you wish; however, if the file is not a plain file, there will be no Content-Length header defined for the request. Not all servers (or server applications) like this. Also, if the file(s) change in size between the time the Content-Length is calculated and the time that the last chunk is delivered, the subroutine will `C<Croak>`.

The `post(...)` method of "LWP::UserAgent" exists as a shortcut for `$ua->request(POST ...)`.

HTTP::Headers - Class encapsulating HTTP Message headers

=head1 SYNOPSIS

```
require HTTP::Headers;  
$h = HTTP::Headers->new;  
  
$h->header('Content-Type' => 'text/plain'); # set  
$ct = $h->header('Content-Type');          # get  
$h->remove_header('Content-Type');         # delete
```

=head1 DESCRIPTION

The C<HTTP::Headers> class encapsulates HTTP-style message headers. The headers consist of attribute-value pairs also called fields, which may be repeated, and which are printed in a particular order. The field names are cases insensitive.

Instances of this class are usually created as member variables of the C<HTTP::Request> and C<HTTP::Response> classes, internal to the library.

The following methods are available:

=over 4

=item \$h = HTTP::Headers->new

Constructs a new C<HTTP::Headers> object. You might pass some initial

attribute-value pairs as parameters to the constructor. I<E.g.>:

```
$h = HTTP::Headers->new(  
    Date      => 'Thu, 03 Feb 1994 00:00:00 GMT',  
    Content_Type => 'text/html; version=3.2',  
    Content_Base => 'http://www.perl.org/');
```

The constructor arguments are passed to the C<header> method which is described below.

=item \$h->clone

Returns a copy of this C<HTTP::Headers> object.

=item \$h->header( \$field )

=item \$h->header( \$field => \$value )

=item \$h->header( \$f1 => \$v1, \$f2 => \$v2, ... )

Get or set the value of one or more header fields. The header field name (\$field) is not case sensitive. To make the life easier for perl users who wants to avoid quoting before the => operator, you can use '\_' as a replacement for '-' in header names.

The header() method accepts multiple (\$field => \$value) pairs, which means that you can update several fields with a single invocation.

The \$value argument may be a plain string or a reference to an array of strings for a multi-valued field. If the \$value is provided as C<undef> then the field is removed.

If the \$value is not given, then that header field will remain unchanged.

The old value (or values) of the last of the header fields is returned. If no such field exists C<undef> will be returned.

A multi-valued field will be returned as separate values in list context and will be concatenated with ", " as separator in scalar context. The HTTP spec (RFC 2616) promise that joining multiple values in this way will not change the semantic of a header field, but in practice there are cases like old-style Netscape cookies (see L<HTTP::Cookies>) where ", " is used as part of the syntax of a single field value.

Examples:

```
$header->header(MIME_Version => '1.0',
```

```
User_Agent => 'My-Web-Client/0.01');
$header->header(Accept => "text/html, text/plain, image/*");
$header->header(Accept => [qw(text/html text/plain image/*)]);
@accepts = $header->header('Accept'); # get multiple values
$accepts = $header->header('Accept'); # get values as a single string
```

```
=item $h->push_header( $field
=> $value )
```

```
=item $h->push_header( $f1 => $v1, $f2 => $v2, ... )
```

Add a new field value for the specified header field. Previous values for the same field are retained.

As for the header() method, the field name (\$field) is not case sensitive and '\_' can be used as a replacement for '-'.

The \$value argument may be a scalar or a reference to a list of scalars.

```
$header->push_header(Accept => 'image/jpeg');
$header->push_header(Accept => [map "image/$_", qw(gif png tiff)]);
```

```
=item $h->init_header( $field => $value )
```

Set the specified header to the given value, but only if no previous value for that field is set.

The header field name (\$field) is not case sensitive and '\_' can be used as a replacement for '-'.

The \$value argument may be a scalar or a reference to a list of scalars.

```
=item $h->remove_header( $field, ... )
```

This function removes the header fields with the specified names.

The header field names (\$field) are not case sensitive and '\_' can be used as a replacement for '-'.

The return value is the values of the fields removed. In scalar context the number of fields removed is returned.

Note that if you pass in multiple field names then it is generally not possible to tell which of the returned values belonged to which field.

=item \$h->remove\_content\_headers

This will remove all the header fields used to describe the content of a message. All header field names prefixed with C<Content-> fall into this category, as well as C<Allow>, C<Expires> and C<Last-Modified>. RFC 2616 denotes these fields as I<Entity Header Fields>.

The return value is a new C<HTTP::Headers> object that contains the removed headers only.

=item \$h->clear

This will remove all header fields.

=item \$h->header\_field\_names

Returns the list of distinct names for the fields present in the header. The field names have case as suggested by HTTP spec, and the names are returned in the recommended "Good Practice" order.

In scalar context return the number of distinct field names.

=item \$h->scan( \&process\_header\_field )

Apply a subroutine to each header field in turn. The callback routine is called with two parameters; the name of the field and a single value (a string). If a header field is multi-valued, then the routine is called once for each value. The field name passed to the callback routine has case as suggested by HTTP spec, and the headers will be visited in the recommended "Good Practice" order.

Any return values of the callback routine are ignored. The loop can be broken by raising an exception (C<die>), but the caller of scan() would have to trap the exception itself.

=item \$h->as\_string

=item \$h->as\_string( \$eol )

Return the header fields as a formatted MIME header. Since it internally uses the C<scan> method to build the string, the result will use case as suggested by HTTP spec, and it will follow recommended "Good Practice" of ordering the header fields. Long header values are not folded.

The optional \$eol parameter specifies

the line ending sequence to use. The default is "\n". Embedded "\n" characters in header field values will be substituted with this line ending sequence.

=back

=head1 CONVENIENCE METHODS

The most frequently used headers can also be accessed through the following convenience methods. Most of these methods can both be used to read and to set the value of a header. The header value is set if you pass an argument to the method. The old header value is always returned. If the given header did not exist then C<undef> is returned.

Methods that deal with dates/times always convert their value to system time (seconds since Jan 1, 1970) and they also expect this kind of value when the header value is set.

=over 4

=item \$h->date

This header represents the date and time at which the message was originated. I<E.g.>:

```
$h->date(time); # set current date
```

=item \$h->expires

This header gives the date and time after which the entity should be considered stale.

=item \$h->if\_modified\_since

=item

```
$h->if_unmodified_since
```

These header fields are used to make a request conditional. If the requested resource has (or has not) been modified since the time specified in this field, then the server will return a C<304 Not Modified> response instead of the document itself.

=item \$h->last\_modified

This header indicates the date and time at which the resource was last modified. I<E.g.>:

```
# check if document is more than 1 hour old
```

```

if (my $last_mod = $h->last_modified) {
    if ($last_mod < time - 60*60) {
        ...
    }
}

```

=item \$h->content\_type

The Content-Type header field indicates the media type of the message content. I<E.g.>:

```
$h->content_type('text/html');
```

The value returned will be converted to lower case, and potential parameters will be chopped off and returned as a separate value if in an array context. If there is no such header field, then the empty string is returned. This makes it safe to do the following:

```

if ($h->content_type eq 'text/html')
{
    # we enter this place even if the real header value happens to
    # be 'TEXT/HTML; version=3.0'
    ...
}

```

=item \$h->content\_type\_charset

Returns the upper-cased charset specified in the Content-Type header. In list context return the lower-cased bare content type followed by the upper-cased charset. Both values will be C<undef> if not specified in the header.

=item \$h->content\_is\_text

Returns TRUE if the Content-Type header field indicate that the content is textual.

=item \$h->content\_is\_html

Returns TRUE if the Content-Type header field indicate that the content is some kind of HTML (including XHTML). This method can't be used to set Content-Type.

=item \$h->content\_is\_xhtml

Returns TRUE if the Content-Type header field indicate that the content is XHTML. This method can't be used to set Content-Type.

=item \$h->content\_is\_xml

Returns TRUE if the Content-Type header field indicate that the content is XML. This method can't be used to set Content-Type.

=item

`$h->content_encoding`

The Content-Encoding header field is used as a modifier to the media type. When present, its value indicates what additional encoding mechanism has been applied to the resource.

=item `$h->content_length`

A decimal number indicating the size in bytes of the message content.

=item `$h->content_language`

The natural language(s) of the intended audience for the message content. The value is one or more language tags as defined by RFC 1766. Eg. "no" for some kind of Norwegian and "en-US" for English the way it is written in the US.

=item `$h->title`

The title of the document. In libwww-perl this header will be initialized automatically from the `E<lt>TITLE>...E<lt>/TITLE>` element of HTML documents. I<This header is no longer part of the HTTP standard.>

=item `$h->user_agent`

This header field is used in request messages and contains information about the user agent originating the request. I<E.g.>:

```
$h->user_agent('Mozilla/5.0 (compatible; MSIE 7.0; Windows NT 6.0);
```

=item `$h->server`

The server header field contains information about the software being used by the originating server program handling the request.

=item `$h->from`

This header should contain an Internet e-mail address for the human user who controls the requesting user agent. The address should be machine-usable, as defined by RFC822. E.g.:

```
$h->from('King Kong <king@kong.com>');
```

I<This header is no longer part of the HTTP standard.>

=item \$h->referer

Used to specify the address (URI) of the document from which the requested resource address was obtained.

The "Free On-line Dictionary of Computing" as this to say about the word I<referer>:

<World-Wide Web> A misspelling of "referrer" which somehow made it into the {HTTP} standard. A given {web page}'s referer (sic) is the {URL} of whatever web page contains the link that the user followed to the current page. Most browsers pass this information as part of a request.

(1998-10-19)

By

popular demand C<referrer> exists as an alias for this method so you can avoid this misspelling in your programs and still send the right thing on the wire.

When setting the referrer, this method removes the fragment from the given URI if it is present, as mandated by RFC2616. Note that the removal does I<not> happen automatically if using the header(), push\_header() or init\_header() methods to set the referrer.

=item \$h->www\_authenticate

This header must be included as part of a C<401 Unauthorized> response. The field value consist of a challenge that indicates the authentication scheme and parameters applicable to the requested URI.

=item \$h->proxy\_authenticate

This header must be included in a C<407 Proxy Authentication Required> response.

=item \$h->authorization

=item \$h->proxy\_authorization

A user agent that wishes to authenticate itself with a server or a proxy, may do so by including these headers.

=item \$h->authorization\_basic

This method is used to get or set an authorization header that use the "Basic Authentication Scheme". In array context it will return two values; the user name and the password. In scalar context it will return I<"uname:password"> as a single string value.

When used to set the header value, it expects two arguments. I<E.g.>:

```
$h->authorization_basic($uname, $password);
```

The method will croak if the \$uname contains a colon ':'.  
=back

=item \$h->proxy\_authorization\_basic

Same as authorization\_basic() but will set the "Proxy-Authorization" header instead.

=back

=head1 NON-CANONICALIZED FIELD NAMES

The header field name spelling is normally canonicalized including the '\_' to '-' translation. There are some application where this is not appropriate. Prefixing field names with ':' allow you to force a specific spelling. For example if you really want a header field name to show up as C<foo\_bar> instead of "Foo-Bar", you might set it like this:

```
$h->header(":foo_bar" => 1);
```

These field names are returned with the ':' intact for \$h->header\_field\_names and the \$h->scan callback, but the colons do not show in \$h->as\_string.

Subject: [PATCH] Respect OpenSSL default ciphers and protocol versions

MIME-Version: 1.0

Content-Type: text/plain; charset=UTF-8

Content-Transfer-Encoding: 8bit

If application did not specified cipher or protocol version,

IO::Socket::SSL set them to 'ALL:!LOW' and 'SSLv23:!SSLv2'. This undermined global cryptographic setting.

This patch disables these defaults hard-coded into IO::Socket::SSL and leaves the decision on OpenSSL.

=head1 NAME

IO::Socket::SSL -- SSL sockets with IO::Socket interface

=head1 SYNOPSIS

```
use strict;
use IO::Socket::SSL;

# simple HTTP client -----
my $sock = IO::Socket::SSL->new(
# where to connect
PeerHost => "www.example.com",
PeerPort => "https",

# certificate verification
SSL_verify_mode => SSL_VERIFY_PEER,
SSL_ca_path => '/etc/ssl/certs', # typical CA path on Linux
# on OpenBSD instead: SSL_ca_file => '/etc/ssl/cert.pem'

# easy hostname verification
SSL_verifcyn_name => 'foo.bar', # defaults to PeerHost
SSL_verifcyn_schema => 'http',

# SNI support
SSL_hostname => 'foo.bar', # defaults to PeerHost

) or die "failed connect or ssl handshake: $!, $SSL_ERROR";

# send and receive over SSL connection
print $client "GET / HTTP/1.0\r\n\r\n";
print <$client>;
```

```

# simple server -----
my $server = IO::Socket::SSL->new(
# where to listen
LocalAddr => '127.0.0.1',
LocalPort => 8080,
Listen => 10,

# which certificate to offer
# with SNI support there can be different certificates per hostname
SSL_cert_file => 'cert.pem',
SSL_key_file => 'key.pem',
) or die "failed to listen: $!";

# accept client
my $client = $server->accept or die
"failed to accept or ssl handshake: $!,$SSL_ERROR";

# Upgrade existing socket to SSL -----
my $sock = IO::Socket::INET->new('imap.example.com:imap');
# ... receive greeting, send STARTTLS, receive ok ...
IO::Socket::SSL->start_SSL($sock,
SSL_verify_mode => SSL_VERIFY_PEER,
SSL_ca_path => '/etc/ssl/certs',
...
) or die "failed to upgrade to SSL: $SSL_ERROR";

# manual name verification, could also be done in start_SSL with
# SSL_verifycn_name etc
$client->verify_hostname( 'imap.example.com','imap' )
or die "hostname verification failed";

# all
data are now SSL encrypted
print $sock ....

```

#### =head1 DESCRIPTION

This module provides an interface to SSL sockets, similar to other IO::Socket modules. Because of that, it can be used to make existing programs using IO::Socket::INET or similar modules to provide SSL encryption without much effort.

IO::Socket::SSL supports all the extra features that one needs to write a full-featured SSL client or server application: multiple SSL contexts, cipher selection, certificate verification, Server Name Indication (SNI), Next Protocol Negotiation (NPN), SSL version selection and more.

If you have never used SSL before, you should read the appendix labelled 'Using SSL' before attempting to use this module.

If you are trying to use it with threads see the BUGS section.

=head1 METHODS

IO::Socket::SSL inherits from another IO::Socket module.

The choice of the super class depends on the installed modules:

=over 4

=item \*

If IO::Socket::IP with at least version 0.20 is installed it will use this module as super class, transparently providing IPv6 and IPv4 support.

=item \*

If IO::Socket::INET6 is installed it will use this module as super class, transparently providing IPv6 and IPv4 support.

=item \*

Otherwise it will fall back to IO::Socket::INET, which is a perl core module. With IO::Socket::INET you only get IPv4 support.

=back

Please be aware, that with the IPv6 capable super classes, it will lookup first for the IPv6 address of a given hostname. If the resolver provides an IPv6 address, but the host cannot be reached by IPv6, there will be no automatic fallback to IPv4.

To avoid these problems you can either force IPv4 by specifying and AF\_INET as C<Domain> of the socket or globally enforce IPv4 by loading IO::Socket::SSL with the option 'inet4'.

IO::Socket::SSL will provide all of the methods of its super class, but sometimes it will override them to match the behavior expected from SSL or to provide additional arguments.

The new or changed methods are described below, but please read also the section about SSL specific error handling.

=over 4

=item B<new(...)>

Creates a new IO::Socket::SSL object. You may use all the friendly options that came bundled with IO::Socket::INET, plus (optionally) the ones that follow:

=over 2

=item SSL\_hostname

This can be given to specify the hostname used for SNI, which is needed if you have multiple SSL hostnames on the same IP address. If not given it will try to determine hostname from PeerAddr, which will fail if only IP was given or if this argument is used within start\_SSL.

If you want to disable SNI set this argument to "".

Currently only supported for the client side and will be ignored for the server side.

See section "SNI Support" for details of SNI the support.

=item SSL\_version

Sets the version of the SSL protocol used to transmit data. 'SSLv23' auto-negotiates between SSLv2 and SSLv3, while 'SSLv2', 'SSLv3' or 'TLSv1' restrict the protocol to the specified version. All values are case-insensitive.

You can limit to set of supported protocols by adding !version separated by ':':

The default SSL\_version is 'SSLv23:!SSLv2' which means, that SSLv2, SSLv3 and TLSv1 are supported for initial protocol handshakes, but SSLv2 will not be accepted, leaving only SSLv3 and TLSv1. You can also use !TLSv11 and !TLSv12 to disable TLS versions 1.1 and 1.2 while allowing TLS version 1.0.

Setting the version instead to 'TLSv1' will probably break interaction with lots of clients which start with SSLv2 and then upgrade to TLSv1. On the other side some clients just close the connection when they receive a TLS version 1.1 request. In this case setting the version to 'SSLv23:!SSLv2:!TLSv11:!TLSv12' might help.

=item SSL\_cipher\_list

If this option is set the cipher list for the connection will be set to the given value, e.g. something like 'ALL:!LOW:!EXP:!ADH'. Look into the OpenSSL documentation ([L<http://www.openssl.org/docs/apps/ciphers.html#CIPHER\\_STRINGS>](http://www.openssl.org/docs/apps/ciphers.html#CIPHER_STRINGS)) for more details.

If

this option is not set 'ALL:!LOW' will be used.  
To use OpenSSL builtin default (whatever this is) set it to ''.

=item SSL\_honor\_cipher\_order

If this option is true the cipher order the server specified is used instead of the order proposed by the client. To mitigate BEAST attack you might use something like

```
SSL_honor_cipher_order => 1,  
SSL_cipher_list => 'RC4-SHA:ALL:!ADH:!LOW',
```

=item SSL\_use\_cert

If this is true, it forces IO::Socket::SSL to use a certificate and key, even if you are setting up an SSL client. If this is set to 0 (the default), then you will only need a certificate and key if you are setting up a server.

SSL\_use\_cert will implicitly be set if SSL\_server is set.  
For convenience it is also set if it was not given but a cert was given for use (SSL\_cert\_file or similar).

=item SSL\_server

Set this option to a true value, if the socket should be used as a server.  
If this is not explicitly set it is assumed, if the Listen parameter is given when creating the socket.

=item SSL\_cert\_file

If your SSL certificate is not in the default place (F<certs/server-cert.pem> for servers, F<certs/client-cert.pem> for clients), then you should use this option to specify the location of your certificate.  
A certificate is usually needed for an SSL server, but might also be needed, if the client should authorize itself with a certificate.

If your SSL server should be able to use different certificates on the same IP address, depending on the name given by SNI, you can use a hash reference instead of a file with C<<hostname => cert\_file>>.

Examples:

```
SSL_cert_file => 'mycert.pem'
```

```
SSL_cert_file => {  
  "foo.example.org" => 'foo.pem',  
  "bar.example.org" => 'bar.pem',
```

```
# used when nothing matches or client does not support SNI
" => 'default.pem',
}
```

=item SSL\_cert

This option can be used instead of C<SSL\_cert\_file> to specify the certificate.

Instead with a file the certificate is given as an X509\* object or array of X509\* objects,

where the first X509\* is the internal representation of the certificate while the following ones are extra certificates.

The option is useful if you create your certificate dynamically (like in a SSL intercepting proxy) or get it from a string (see openssl PEM\_read\_bio\_X509 etc for getting a X509\* from a string).

For SNI support a hash reference can be given, similar to the C<SSL\_cert\_file> option.

=item SSL\_key\_file

If your RSA private key is not in default place (F<certs/server-key.pem> for servers, F<certs/client-key.pem> for clients), then this is the option that you would use to specify a different location. Keys should be PEM formatted, and if they are encrypted, you will be prompted to enter a password before the socket is formed (unless you specified the SSL\_passwd\_cb option).

For SNI support a hash reference can be given, similar to the C<SSL\_cert\_file> option.

=item SSL\_key

This option can be used instead of C<SSL\_key> to specify the certificate.

Instead of a file an EVP\_PKEY\* should be given.

This option is useful if you don't have your key in a file but create it dynamically or get it from a string (see openssl PEM\_read\_bio\_PrivateKey etc for getting a EVP\_PKEY\* from a string).

For SNI support a hash reference can be given, similar to the C<SSL\_key> option.

=item SSL\_dh\_file

If you want Diffie-Hellman key exchange you need to supply a suitable file here or use the SSL\_dh parameter. See dhparam command in openssl for more information.

=item SSL\_dh

Like `SSL_dh_file`, but instead of giving a file you use a preloaded or generated DH\*.

=item `SSL_passwd_cb`

If your private key is encrypted, you might not want the default password prompt from `Net::SSL`. This option takes a reference to a subroutine that should return the password required to decrypt your private key.

=item `SSL_ca_file`

If you want to verify that the peer certificate has been signed by a reputable certificate authority, then you should use this option to locate the file containing

the certificateZ<>(s) of the reputable certificate authorities if it is not already in the file `F<certs/my-ca.pem>`.

If you definitely want no `SSL_ca_file` used you should set it to `undef`.

=item `SSL_ca_path`

If you are unusually friendly with the OpenSSL documentation, you might have set yourself up a directory containing several trusted certificates as separate files as well as an index of the certificates. If you want to use that directory for validation purposes, and that directory is not `F<ca/>`, then use this option to point `IO::Socket::SSL` to the right place to look.

If you definitely want no `SSL_ca_path` used you should set it to `undef`.

=item `SSL_verify_mode`

This option sets the verification mode for the peer certificate.

You may combine `SSL_VERIFY_PEER` (`verify_peer`), `SSL_VERIFY_FAIL_IF_NO_PEER_CERT` (`fail verification if no peer certificate exists; ignored for clients`),

`SSL_VERIFY_CLIENT_ONCE` (`verify client once; ignored for clients`).

See OpenSSL man page for `SSL_CTX_set_verify` for more information.

The default is `SSL_VERIFY_NONE` for server (e.g. no check for client certificate).

For historical reasons the default for client is currently also `SSL_VERIFY_NONE`, but this will change to `SSL_VERIFY_PEER` in the near future. To aid transition a warning is issued if the client is used with the default `SSL_VERIFY_NONE`, unless `SSL_verify_mode` was explicitly set by the application.

=item `SSL_verify_callback`

If you want to verify certificates yourself, you can pass a sub reference along with this parameter to do so. When the callback is called, it will be passed:

=over 4

=item 1.

a true/false value that indicates what OpenSSL thinks of the certificate,

=item 2.

a C-style memory address of the certificate store,

=item 3.

a string containing the certificate's issuer attributes and owner attributes, and

=item 4.

a string containing any errors encountered (0 if no errors).

=item 5.

a C-style memory address of the peer's own certificate (convertible to PEM form

with `Net::SSLLeay::PEM_get_string_X509()`).

=back

The function should return 1 or 0, depending on whether it thinks the certificate is valid or invalid. The default is to let OpenSSL do all of the busy work.

The callback will be called for each element in the certificate chain.

See the OpenSSL documentation for `SSL_CTX_set_verify` for more information.

=item `SSL_verifycn_scheme`

Set the scheme used to automatically verify the hostname of the peer.

See the information about the verification schemes in `B<verify_hostname>`.

The default is `undef`, e.g. to not automatically verify the hostname.

If no verification is done the other `B<SSL_verifycn_*>` options have no effect, but you might still do manual verification by calling

`B<verify_hostname>`.

=item `SSL_verifycn_name`

Set the name which is used in verification of hostname. If `SSL_verifycn_scheme` is set and no `SSL_verifycn_name` is given it will try to use the `PeerHost` and `PeerAddr` settings and fail if no name can be determined.

Using `PeerHost`

or `PeerAddr` works only if you create the connection directly

with `C<< IO::Socket::SSL->new >>`, if an `IO::Socket::INET` object is upgraded

with `B<start_SSL>` the name has to be given in `B<SSL_verifycn_name>`.

=item SSL\_check\_crl

If you want to verify that the peer certificate has not been revoked by the signing authority, set this value to true. OpenSSL will search for the CRL in your SSL\_ca\_path, or use the file specified by SSL\_crl\_file. See the Net::SSLeay documentation for more details. Note that this functionality appears to be broken with OpenSSL < v0.9.7b, so its use with lower versions will result in an error.

=item SSL\_crl\_file

If you want to specify the CRL file to be used, set this value to the pathname to be used. This must be used in addition to setting SSL\_check\_crl.

=item SSL\_reuse\_ctx

If you have already set the above options (SSL\_version through SSL\_check\_crl; this does not include SSL\_cipher\_list yet) for a previous instance of IO::Socket::SSL, then you can reuse the SSL context of that instance by passing it as the value for the SSL\_reuse\_ctx parameter. You may also create a new instance of the IO::Socket::SSL::SSL\_Context class, using any context options that you desire without specifying connection options, and pass that here instead.

If you use this option, all other context-related options that you pass in the same call to new() will be ignored unless the context supplied was invalid. Note that, contrary to versions of IO::Socket::SSL below v0.90, a global SSL context will not be implicitly used unless you use the set\_default\_context() function.

=item SSL\_create\_ctx\_callback

With this callback you can make individual settings to the context after it got created and the default setup was done. The callback will be called with the CTX object from Net::SSLeay as the single argument.

Example for limiting the server session cache size:

```
SSL_create_ctx_callback => sub {  
    my $ctx = shift;  
    Net::SSLeay::CTX_sess_set_cache_size($ctx,128);  
}
```

=item SSL\_session\_cache\_size

If you make repeated connections to the same host/port and the SSL renegotiation time

is an issue, you can turn on client-side session caching with this option by specifying a positive cache size. For successive connections, pass the `SSL_reuse_ctx` option to the `new()` calls (or use `set_default_context()`) to make use of the cached sessions. The session cache size refers to the number of unique host/port pairs that can be stored at one time; the oldest sessions in the cache will be removed if new ones are added.

This option does not effect the session cache a server has for it's clients, e.g. it does not affect SSL objects with `SSL_server` set.

=item `SSL_session_cache`

Specifies session cache object which should be used instead of creating a new. Overrides `SSL_session_cache_size`.

This option is useful if you want to reuse the cache, but not the rest of the context.

A session cache object can be created using  
`C<< IO::Socket::SSL::Session_Cache->new( cachesize ) >>`.

Use `set_default_session_cache()` to set a global cache object.

=item `SSL_session_id_context`

This gives an id for the servers session cache. It's necessary if you want clients to connect with a client certificate. If not given but `SSL_verify_mode` specifies the need for client certificate a context unique id will be picked.

=item `SSL_error_trap`

When using the `accept()` or `connect()` methods, it may be the case that the actual socket connection works but the SSL negotiation fails, as in the case of an HTTP client connecting to an HTTPS server. Passing a subroutine ref attached to this parameter allows you to gain control of the orphaned socket instead of having it be closed forcibly. The subroutine, if called, will be passed two parameters: a reference to the socket on which the SSL negotiation failed and the full text of the error message.

=item `SSL_npn_protocols`

If used on the server side it specifies list of protocols advertised by SSL server as an array

ref, e.g. [`'spdy/2'`,`'http1.1'`].

On the client side it specifies the protocols offered by the client for NPN as an array ref.

See also method `L<next_proto_negotiated>`.

Next Protocol Negotiation (NPN) is available with Net::SSLey 1.46+ and openssl-1.0.1+.

To check support you might call `C<IO::Socket::SSL->can_npn()`.

If you use this option with an unsupported Net::SSLey/OpenSSL it will throw an error.

=back

=item B<close(...)>

There are a number of nasty traps that lie in wait if you are not careful about using `close()`. The first of these will bite you if you have been using `shutdown()` on your sockets. Since the SSL protocol mandates that a SSL "close notify" message be sent before the socket is closed, a `shutdown()` that closes the socket's write channel will cause the `close()` call to hang. For a similar reason, if you try to close a copy of a socket (as in a forking server) you will affect the original socket as well.

To get around these problems, call `close` with an object-oriented syntax

(e.g. `$socket->close(SSL_no_shutdown => 1)`)

and one or more of the following parameters:

=over 2

=item SSL\_no\_shutdown

If set to a true value, this option will make `close()` not use the `SSL_shutdown()` call on the socket in question so that the close operation can complete without problems if you have used `shutdown()` or are working on a copy of a socket.

=item SSL\_fast\_shutdown

If set to true only a unidirectional shutdown will be done, e.g. only the `close_notify` (see `SSL_shutdown(3)`) will be called. Otherwise a bidirectional shutdown will be done. If used within `close()` it defaults to true, if used within `stop_SSL()` it defaults to false.

=item SSL\_ctx\_free

If you want to make sure that the SSL context of the socket is destroyed when you close it, set this option to a true value.

=back

=item B<peek(...)>

This function has exactly the same syntax as `sysread()`, and performs nearly the same task (reading data from the socket) but will not advance the read position

so

that successive calls to `peek()` with the same arguments will return the same results.

This function requires OpenSSL 0.9.6a or later to work.

=item B<pending()>

This function will let you know how many bytes of data are immediately ready for reading from the socket. This is especially handy if you are doing reads on a blocking socket or just want to know if new data has been sent over the socket.

=item B<get\_cipher()>

Returns the string form of the cipher that the IO::Socket::SSL object is using.

=item B<dump\_peer\_certificate()>

Returns a parsable string with select fields from the peer SSL certificate. This method directly returns the result of the dump\_peer\_certificate() method of Net::SSLeay.

=item B<peer\_certificate(\$field)>

If a peer certificate exists, this function can retrieve values from it.

If no field is given the internal representation of certificate from Net::SSLeay is returned.

The following fields can be queried:

=over 8

=item authority (alias issuer)

The certificate authority which signed the certificate.

=item owner (alias subject)

The owner of the certificate.

=item commonName (alias cn) - only for Net::SSLeay version >=1.30

The common name, usually the server name for SSL certificates.

=item subjectAltNames - only for Net::SSLeay version >=1.33

Alternative names for the subject, usually different names for the same server, like example.org, example.com, \*.example.com.

It returns a list of (typ,value) with typ GEN\_DNS, GEN\_IPADD etc (these constants are exported from IO::Socket::SSL).

See Net::SSLey::X509\_get\_subjectAltNames.

=back

=item B<get\_servername>

This gives the name requested by the client if Server Name Indication (SNI) was used.

=item B<verify\_hostname(\$hostname,\$scheme)>

This verifies the given hostname against the peer certificate using the given scheme. Hostname is usually what you specify within the PeerAddr.

Verification of hostname against a certificate is different between various applications and RFCs. Some scheme allow wildcards for hostnames, some only in subjectAltNames, and even their different wildcard schemes are possible.

To ease the verification the following schemes are predefined:

=over 8

=item ldap (rfc4513), pop3,imap,acap (rfc2995), nntp (rfc4642)

Simple wildcards in subjectAltNames are possible, e.g. \*.example.org matches www.example.org but not lala.www.example.org. If nothing from subjectAltNames match it checks against the common name, but there are no wildcards allowed.

=item http (rfc2818), alias is www

Extended wildcards in subjectAltNames and common name are possible, e.g. \*.example.org or even www\*.example.org. The common name will be only checked if no names are given in subjectAltNames.

=item smtp (rfc3207)

This RFC doesn't say much useful about the verification so it just assumes that subjectAltNames are possible, but no wildcards are possible anywhere.

=item none

No verification will be done.  
Actually is does not make any sense to call verify\_hostname in this case.

=back

The scheme can be given either by specifying the name for one of the above predefined schemes, or by using a hash which can have the following keys and values:

=over 8

=item check\_cn: 0|'always'|'when\_only'

Determines if the common name gets checked. If 'always' it will always be checked (like in ldap), if 'when\_only' it will only be checked if no names are given in subjectAltNames (like in http), for any other values the common name will not be checked.

=item wildcards\_in\_alt: 0|'leftmost'|'anywhere'

Determines if and where wildcards in subjectAltNames are possible. If 'leftmost' only cases like \*.example.org will be possible (like in ldap), for 'anywhere' www\*.example.org is possible too (like http), dangerous things like but www.\*.org or even '\*' will not be allowed.

=item wildcards\_in\_cn: 0|'leftmost'|'anywhere'

Similar to wildcards\_in\_alt, but checks the common name. There is no predefined scheme which allows wildcards in common names.

=item

callback: \&coderef

If you give a subroutine for verification it will be called with the arguments (\$hostname,\$commonName,@subjectAltNames), where hostname is the name given for verification, commonName is the result from peer\_certificate('cn') and subjectAltNames is the result from peer\_certificate('subjectAltNames').

All other arguments for the verification scheme will be ignored in this case.

=back

=item B<next\_proto\_negotiated(>

This method returns the name of negotiated protocol - e.g. 'http/1.1'. It works for both client and server side of SSL connection.

NPN support is available with Net::SSLeay 1.46+ and openssl-1.0.1+.

To check support you might call C<IO::Socket::SSL->can\_npn(>.

=item B<errstr(>

Returns the last error (in string form) that occurred. If you do not have a real object to perform this method on, call IO::Socket::SSL::errstr() instead.

For read and write errors on non-blocking sockets, this method may include the string C<SSL wants a read first!> or C<SSL wants a write first!> meaning that the other side is expecting to read from or write to the socket and wants to be satisfied before you get to do anything. But with version 0.98 you are better comparing the global exported variable \$SSL\_ERROR against the exported symbols SSL\_WANT\_READ and SSL\_WANT\_WRITE.

=item B<opened()>

This returns false if the socket could not be opened, 1 if the socket could be opened and the SSL handshake was successful done and -1 if the underlying IO::Handle is open, but the SSL handshake failed.

=item B<< IO::Socket::SSL->start\_SSL(\$socket, ... ) >>

This will convert a glob reference or a socket that you provide to an IO::Socket::SSL object. You may also pass parameters to specify context or connection options as with a call to new(). If you are using this function on an accept()ed socket, you must set the parameter "SSL\_server" to 1, i.e. IO::Socket::SSL->start\_SSL(\$socket, SSL\_server => 1). If you have a class that inherits from IO::Socket::SSL and you want the \$socket to be blessed into your own class instead, use MyClass->start\_SSL(\$socket) to achieve the desired effect.

Note that if start\_SSL() fails in SSL negotiation, \$socket will remain blessed in its original class. For non-blocking sockets you better just upgrade the socket to IO::Socket::SSL and call accept\_SSL or connect\_SSL and the upgraded object. To just upgrade the socket set B<SSL\_startHandshake> explicitly to 0. If you call start\_SSL w/o this parameter it will revert to blocking behavior for accept\_SSL and connect\_SSL.

If given the parameter "Timeout" it will stop if after the timeout no SSL connection was established. This parameter is only used for blocking sockets, if it is not given the default Timeout from the underlying IO::Socket will be used.

=item B<stop\_SSL(...)>

This is the opposite of start\_SSL(), e.g. it will shutdown the SSL connection and return to the class before start\_SSL(). It gets the same arguments as close(), in fact close() calls stop\_SSL() (but without downgrading the class).

Will return true if it succeeded and undef if failed. This might be the case for non-blocking sockets. In this case \$! is set to EAGAIN and the ssl error to SSL\_WANT\_READ or SSL\_WANT\_WRITE. In this case the call should be retried again with the same arguments once the socket is ready is until it succeeds.

=item B<< IO::Socket::SSL->new\_from\_fd(\$fd, ... ) >>

This will convert a socket identified via a file descriptor into an SSL socket.

Note that the argument list does not include a "MODE" argument; if you supply one, it will be thoughtfully ignored (for compatibility with IO::Socket::INET). Instead, a mode of '+<' is assumed, and the file descriptor passed must be able to handle such I/O because the initial SSL handshake requires bidirectional communication.

=item B<IO::Socket::SSL::set\_default\_context(...)>

You may use this to make IO::Socket::SSL automatically re-use a given context (unless specifically overridden in a call to new()).

It accepts one argument, which should be either an IO::Socket::SSL object or an IO::Socket::SSL::SSL\_Context object. See the SSL\_reuse\_ctx option of new() for more details. Note that this sets the default context globally, so use with caution (esp. in mod\_perl scripts).

=item B<IO::Socket::SSL::set\_default\_session\_cache(...)>

You may use this to make IO::Socket::SSL automatically re-use a given session cache (unless specifically overridden in a call to new()). It accepts one argument, which should be an IO::Socket::SSL::Session\_Cache object or similar (e.g something which implements get\_session and add\_session like IO::Socket::SSL::Session\_Cache does). See the SSL\_session\_cache option of new() for more details. Note that this sets the default cache globally, so use with caution.

=item B<IO::Socket::SSL::set\_defaults(%args)>

With this function one can set defaults for all SSL\_\* parameter used for creation of the context, like the SSL\_verify\* parameter.

=over 8

=item mode -  
set default SSL\_verify\_mode

=item callback - set default SSL\_verify\_callback

=item scheme - set default SSL\_verifycn\_scheme

=item name - set default SSL\_verifycn\_name

If not given and scheme is hash reference with key callback it will be set to 'unknown'

=back

=back

The following methods are unsupported (not to mention futile!) and IO::Socket::SSL will emit a large CROAK() if you are silly enough to use them:

=over 4

=item truncate

=item stat

=item ungetc

=item setbuf

=item setvbuf

=item fdopen

=item send/rcv

Note that `send()` and `recv()` cannot be reliably trapped by a tied filehandle (such as that used by `IO::Socket::SSL`) and so may send unencrypted data over the socket. Object-oriented calls to these functions will fail, telling you to use the `print/printf/syswrite` and `read/sysread` families instead.

=back

=head1 ERROR HANDLING

If an SSL specific error occurs the global variable `C<$$SSL_ERROR>` will be set.

If the error occurred on an existing SSL socket the method `C<errstr>`

will

give access to the latest socket specific error.

Both `C<$$SSL_ERROR>` and `C<errstr>` method give a dualvar similar to `C<$!>`, e.g.

providing an error number in numeric context or an error description in string context.

=head1 NON-BLOCKING I/O

If you have a non-blocking socket, the expected behavior on read, write, accept or connect is to set `C<$!>` to `EAGAIN` if the operation can not be completed immediately.

With SSL there are cases, like with SSL handshakes, where the write operation can not be completed until it can read from the socket or vice versa.

In these cases `C<$!>` is set to `EAGAIN` like expected, and additionally

`C<$$SSL_ERROR>` is set to either `SSL_WANT_READ` or `SSL_WANT_WRITE`.

Thus if you get `EAGAIN` on a SSL socket you must check `C<$$SSL_ERROR>` for `SSL_WANT_*` and adapt your event mask accordingly.

Using `readline` on non-blocking sockets does not make much sense and I would advise against using it.

And, while the behavior is not documented for other L<IO::Socket> classes, it will try to emulate the behavior seen there, e.g. to return the received data instead of blocking, even if the line is not complete. If an unrecoverable error occurs it will return nothing, even if it already received some data.

## =head1 SNI Support

Newer extensions to SSL can distinguish between multiple hostnames on the same IP address using Server Name Indication (SNI).

Support for SNI on the client side was added somewhere in the OpenSSL 0.9.8 series, but only with 1.0 a bug was fixed when the server could not decide about its hostname. Therefore client side SNI is only supported with OpenSSL 1.0 or higher in L<IO::Socket::SSL>.

With a supported version, SNI is used automatically on the client side, if it can determine the hostname from C<PeerAddr> or C<PeerHost>. On unsupported OpenSSL versions it will silently not use SNI.

The hostname can also be given explicitly given with C<SSL\_hostname>, but in this case it will throw in error, if SNI is not supported.

To check for support you might call C<IO::Socket::SSL->can\_client\_sni()>.

On the server side earlier versions of OpenSSL are supported, but only together with L<Net::SSLeay> version >= 1.50.

To check for support you might call C<IO::Socket::SSL->can\_server\_sni()>.

If server side SNI is supported, you might specify different certificates per host with C<SSL\_cert\*> and C<SSL\_key\*>, and check the requested name using C<get\_servername>.

## =head1 RETURN VALUES

A few changes have gone into IO::Socket::SSL v0.93 and later with respect to return values. The behavior on success remains unchanged, but for I<all> functions, the return value on error is now an empty list. Therefore, the return value will be false in all contexts, but those who have been using the return values as arguments to subroutines (like C<mysub(IO::Socket::SSL(...)->new, ...)>) may run into problems. The moral of the story: I<always> check the return values of these functions before using them in any way that you consider meaningful.

## =head1

### DEBUGGING

If you are having problems using IO::Socket::SSL despite the fact that can recite backwards the section of this documentation labelled 'Using SSL', you should try enabling debugging. To specify the debug level, pass 'debug#' (where # is a number from 0 to 3) to IO::Socket::SSL when calling it.

The debug level will also be propagated to Net::SSLeay::trace, see also L<Net::SSLeay>:

=over 4

=item use IO::Socket::SSL qw(debug0);

No debugging (default).

=item use IO::Socket::SSL qw(debug1);

Print out errors from IO::Socket::SSL and ciphers from Net::SSLeay.

=item use IO::Socket::SSL qw(debug2);

Print also information about call flow from IO::Socket::SSL and progress information from Net::SSLeay.

=item use IO::Socket::SSL qw(debug3);

Print also some data dumps from IO::Socket::SSL and from Net::SSLeay.

=back

=head1 EXAMPLES

See the 'example' directory.

=head1 BUGS

IO::Socket::SSL depends on Net::SSLeay. Up to version 1.43 of Net::SSLeay it was not thread safe, although it did probably work if you did not use SSL\_verify\_callback and SSL\_password\_cb.

If you use IO::Socket::SSL together with threads you should load it (e.g. use or require) inside the main thread before creating any other threads which use it. This way it is much faster because it will be initialized only once. Also there are reports that it might crash the other way.

Creating an IO::Socket::SSL object in one thread and closing it in another thread will not work.

IO::Socket::SSL does not work together with Storable::fd\_retrieve/fd\_store. See BUGS file for more information and how to work around the problem.

Non-blocking and timeouts (which are based on non-blocking) are not supported on Win32, because the underlying IO::Socket::INET does not support non-blocking on this platform.

If you have a server and it looks like you have a memory leak you might check the size of your session cache. Default for Net::SSLLeay seems to be 20480, see the example for SSL\_create\_ctx\_callback for how to limit it.

The default for SSL\_verify\_mode on the client is currently SSL\_VERIFY\_NONE, which is a very bad idea, thus the default will change in the near future. See documentation for SSL\_verify\_mode for more information.

## =head1 LIMITATIONS

IO::Socket::SSL uses Net::SSLLeay as the shiny interface to OpenSSL, which is the shiny interface to the ugliness of SSL. As a result, you will need both Net::SSLLeay and OpenSSL on your computer before using this module.

If you have Scalar::Util (standard with Perl 5.8.0 and above) or WeakRef, IO::Socket::SSL sockets will auto-close when they go out of scope, just like IO::Socket::INET sockets. If you do not have one of these modules, then IO::Socket::SSL sockets will stay open until the program ends or you explicitly close them. This is due to the fact that a circular reference is required to make IO::Socket::SSL sockets act simultaneously like objects and glob references.

## =head1 DEPRECATIONS

The following functions are deprecated and are only retained for compatibility:

=over 2

=item context\_init()

use the SSL\_reuse\_ctx option if you want to re-use a context

=item socketToSSL() and socket\_to\_SSL()

use IO::Socket::SSL->start\_SSL() instead

=item kill\_socket()

use close() instead

=item get\_peer\_certificate()

use the peer\_certificate() function instead.

Used to return X509\_Certificate with methods subject\_name and issuer\_name.

Now simply returns \$self which has these methods (although deprecated).

=item issuer\_name()

use peer\_certificate( 'issuer' ) instead

=item subject\_name()

use peer\_certificate( 'subject' ) instead

=head1 Appendix: Using SSL

If you are unfamiliar with the way OpenSSL works, good references may be found in both the book "Network Security with OpenSSL" (Oreilly & Assoc.) and the web site L<<http://www.tldp.org/HOWTO/SSL-Certificates-HOWTO/>>. Read on for a quick overview.

=head2 The Long of It (Detail)

The usual reason for using SSL is to keep your data safe. This means that not only do you have to encrypt the data while it is being transported over a network, but you also have to make sure that the right person gets the data. To accomplish this

with SSL, you have to use certificates. A certificate closely resembles a Government-issued ID (at least in places where you can trust them). The ID contains some sort of identifying information such as a name and address, and is usually stamped with a seal of Government Approval. Theoretically, this means that you may trust the information on the card and do business with the owner of the card. The same ideas apply to SSL certificates, which have some identifying information and are "stamped" [most people refer to this as I<signing> instead] by someone (a Certificate Authority) who you trust will adequately verify the identifying information. In this case, because of some clever number theory, it is extremely difficult to falsify the stamping process. Another useful consequence of number theory is that the certificate is linked to the encryption process, so you may encrypt data (using information on the certificate) that only the certificate owner can decrypt.

What does this mean for you? It means that at least one person in the party has to have an ID to get drinks :-). Seriously, it means that one of the people communicating has to have a certificate to ensure that your data is safe. For client/server interactions, the server must B<always> have a certificate. If the server wants to verify that the client is safe, then the client must also have a personal certificate. To verify that a certificate is safe, one compares the stamped "seal" [commonly called an I<encrypted digest/hash/signature>] on the certificate with the official "seal" of the Certificate Authority to make sure that they are the same. To do this, you will need the [unfortunately named] certificate of the Certificate Authority. With all these in hand, you can set up a SSL connection and be reasonably confident that no-one is reading your data.

=head2 The Short of It (Summary)

For servers, you will need to generate a cryptographic private key and a certificate request. You will need to send the certificate request to a Certificate Authority to get a real certificate back, after which you can start serving people. For clients, you will not need anything unless the server wants validation, in which case you will also need a private key and a real certificate. For more information about how to get these, see L<[http://www.modssl.org/docs/2.8/ssl\\_faq.html#ToC24](http://www.modssl.org/docs/2.8/ssl_faq.html#ToC24)>.

=head1 NAME

Exporter - Implements default import method for modules

=head1 SYNOPSIS

In module F<YourModule.pm>:

```
package YourModule;
require Exporter;
@ISA = qw(Exporter);
@EXPORT_OK = qw(munge frobnicate); # symbols to export on request
```

or

```
package YourModule;
use Exporter 'import'; # gives you Exporter's import() method directly
@EXPORT_OK = qw(munge frobnicate); # symbols to export on request
```

In other files which wish to use C<YourModule>:

```
use YourModule qw(frobnicate); # import listed symbols
frobnicate ($left, $right) # calls YourModule::frobnicate
```

Take a look at L</Good Practices> for some variants you will like to use in modern Perl code.

=head1 DESCRIPTION

The Exporter module implements an C<import> method which allows a module to export functions and variables to its users' namespaces. Many modules use Exporter rather than implementing their own C<import> method because Exporter provides a highly flexible interface, with an implementation optimised for the common case.

Perl automatically calls the C<import> method when processing a C<use> statement for a module. Modules and C<use> are documented in L<perlfunc> and L<perlmod>. Understanding the concept of modules and how the C<use> statement operates is important to understanding the Exporter.

=head2 How to Export

The arrays C<@EXPORT> and C<@EXPORT\_OK> in a module hold lists of

symbols that are going to be exported into the users name space by default, or which they can request to be exported, respectively. The symbols can represent functions, scalars, arrays, hashes, or typeglobs. The symbols must be given by full name with the exception that the ampersand in front of a function is optional, e.g.

```
@EXPORT = qw(afunc $scalar @array); # afunc is a function
@EXPORT_OK = qw(&bfunc %hash *typeglob); # explicit prefix on &bfunc
```

If you are only exporting function names it is recommended to omit the ampersand, as the implementation is faster this way.

=head2 Selecting What to Export

Do B<not> export method names!

Do B<not> export anything else by default without a good reason!

Exports pollute the namespace of the module user. If you must export try to use C<@EXPORT\_OK> in preference to C<@EXPORT> and avoid short or common symbol names to reduce the risk of name clashes.

Generally anything not exported is still accessible from outside the module using the C<YourModule::item\_name> (or C<< \$blessed\_ref->method >>) syntax. By convention you can use a leading underscore on names to informally indicate that they are 'internal' and not for public use.

(It is actually possible to get private functions by saying:

```
my $subref = sub { ... };
$subref->(@args);      # Call it as a function
$obj->$subref(@args);  # Use it as a method
```

However if you use them for methods it is up to you to figure out how to make inheritance work.)

As a general rule, if the module is trying to be object oriented then export nothing. If it's just a collection of functions then C<@EXPORT\_OK> anything but use C<@EXPORT> with caution. For function and method names use barewords in preference to names prefixed with ampersands for the export lists.

Other module design guidelines can be found in L<perlmod>.

=head2 How to Import

In other files which wish to use your module there are three basic ways for them to load your module and import its symbols:

=over 4

=item C<use YourModule;>

This imports all the symbols from YourModule's C<@EXPORT> into the namespace of the C<use> statement.

=item C<use YourModule ();>

This causes perl to load your module but does not import any symbols.

=item C<use YourModule qw(...);>

This imports only the symbols listed by the caller into their namespace. All listed symbols must be in your C<@EXPORT> or C<@EXPORT\_OK>, else an error occurs. The advanced export features of Exporter are accessed like this, but with list entries that are syntactically distinct from symbol names.

=back

Unless you want to use its advanced features, this is probably all you need to know to use Exporter.

=head1 Advanced Features

=head2 Specialised Import Lists

If any of the entries in an import list begins with !, : or / then the list is treated as a series of specifications which either add to or delete from the list of names to import. They are processed left to right. Specifications are in the form:

```
[!]name      This name only
[!]:DEFAULT  All names in @EXPORT
[!]:tag      All names in $EXPORT_TAGS{tag} anonymous list
[!]/pattern/ All names in @EXPORT and @EXPORT_OK which match
```

A leading ! indicates that matching names should be deleted from the list of names to import. If the first specification is a deletion it is treated as though preceded by :DEFAULT. If you just want to import extra names in addition to the default set you will still need to include :DEFAULT explicitly.

e.g.,

F<Module.pm> defines:

```
@EXPORT    = qw(A1 A2 A3 A4 A5);
@EXPORT_OK = qw(B1 B2 B3 B4 B5);
%EXPORT_TAGS = (T1 => [qw(A1 A2 B1 B2)], T2 => [qw(A1 A2 B3 B4)]);
```

Note that you cannot use tags in @EXPORT or @EXPORT\_OK.

Names in EXPORT\_TAGS must also appear in @EXPORT or @EXPORT\_OK.

An application using Module can say something like:

```
use Module qw(:DEFAULT :T2 !B3 A3);
```

Other examples include:

```
use Socket qw(!^[AP]F/ !SOMAXCONN !SOL_SOCKET);
use POSIX qw(:errno_h :termios_h !TCSADRAIN !^EXIT/);
```

Remember that most patterns (using //) will need to be anchored with a leading ^, e.g., C</^EXIT/> rather than C</EXIT/>.

You can say C<BEGIN { \$Exporter::Verbose=1 }> to see how the specifications are being processed and what is actually being imported into modules.

=head2 Exporting Without Using Exporter's import Method

Exporter has a special method, 'export\_to\_level' which is used in situations where you can't directly call Exporter's import method. The export\_to\_level method looks like:

```
MyPackage->export_to_level(
$where_to_export, $package, @what_to_export
);
```

where C<\$where\_to\_export> is an integer telling how far up the calling stack to export your symbols, and C<@what\_to\_export> is an array telling what symbols \*to\* export (usually this is C<@\_>). The C<\$package> argument is currently unused.

For example, suppose that you have a module, A, which already has an import function:

```
package A;
```

```
@ISA = qw(Exporter);
@EXPORT_OK = qw ($b);
```

```
sub import
{
$A::b = 1; # not a very useful import method
}
```

and you want to Export symbol C<\$A::b> back to the module that called package A. Since Exporter relies on the import method to work, via inheritance, as it stands Exporter::import() will never get called. Instead, say the following:

```
package A;
@ISA = qw(Exporter);
@EXPORT_OK = qw ($b);

sub import
{
$A::b = 1;
A->export_to_level(1, @_);
}
```

This will export the symbols one level 'above' the current package - ie: to the program or module that used package A.

Note: Be careful not to modify C<@\_> at all before you call export\_to\_level - or people using your package will get very unexplained results!

=head2 Exporting Without Inheriting from Exporter

By including Exporter in your C<@ISA> you inherit an Exporter's import() method but you also inherit several other helper methods which you probably don't want. To avoid this you can do

```
package YourModule;
use Exporter qw( import );
```

which will export Exporter's own import() method into YourModule. Everything will work as before but you won't need to include Exporter in C<@YourModule::ISA>.

Note: This feature was introduced in version 5.57 of Exporter, released with perl 5.8.3.

=head2 Module Version Checking

The Exporter module will convert an attempt to import a number from a module into a call to `C<< $module_name->VERSION($value) >>`. This can be used to validate that the version of the module being used is greater than or equal to the required version.

For historical reasons, Exporter supplies a `C<require_version>` method that simply delegates to `C<VERSION>`. Originally, before `C<UNIVERSAL::VERSION>` existed, Exporter would call `C<require_version>`.

Since the `C<UNIVERSAL::VERSION>` method treats the `C<$VERSION>` number as a simple numeric value it will regard version 1.10 as lower than 1.9. For this reason it is strongly recommended that you use numbers with at least two decimal places, e.g., 1.09.

## =head2 Managing Unknown Symbols

In some situations you may want to prevent certain symbols from being exported. Typically this applies to extensions which have functions or constants that may not exist on some systems.

The names of any symbols that cannot be exported should be listed in the `C<@EXPORT_FAIL>` array.

If a module attempts to import any of these symbols the Exporter will give the module an opportunity to handle the situation before generating an error. The Exporter will call an `export_fail` method with a list of the failed symbols:

```
@failed_symbols = $module_name->export_fail(@failed_symbols);
```

If the `C<export_fail>` method returns an empty list then no error is recorded and all the requested symbols are exported. If the returned list is not empty then an error is generated for each symbol and the export fails. The Exporter provides a default `C<export_fail>` method which simply returns the list unchanged.

Uses for the `C<export_fail>` method include giving better error messages for some symbols and performing lazy architectural checks (put more symbols into `C<@EXPORT_FAIL>` by default and then take them out if someone actually tries to use them and an expensive check shows that they are usable on that platform).

## =head2 Tag Handling Utility Functions

Since the symbols listed within `C<%EXPORT_TAGS>` must also appear in either `C<@EXPORT>` or `C<@EXPORT_OK>`, two utility functions are provided which allow

you to easily add tagged sets of symbols to C<@EXPORT>  
or C<@EXPORT\_OK>:

```
%EXPORT_TAGS = (foo => [qw(aa bb cc)], bar => [qw(aa cc dd)]);
```

```
Exporter::export_tags('foo'); # add aa, bb and cc to @EXPORT  
Exporter::export_ok_tags('bar'); # add aa, cc and dd to @EXPORT_OK
```

Any names which are not tags are added to C<@EXPORT> or C<@EXPORT\_OK>  
unchanged but will trigger a warning (with C<-w>) to avoid misspelt tags  
names being silently added to C<@EXPORT> or C<@EXPORT\_OK>. Future versions  
may make this a fatal error.

## =head2 Generating Combined Tags

If several symbol categories exist in C<%EXPORT\_TAGS>, it's usually  
useful to create the utility ":all" to simplify "use" statements.

The simplest way to do this is:

```
%EXPORT_TAGS = (foo => [qw(aa bb cc)], bar => [qw(aa cc dd)]);  
  
# add all the other ":class" tags to the ":all" class,  
# deleting duplicates  
{  
    my %seen;  
  
    push @{$EXPORT_TAGS{all}},  
        grep { !$seen{$_} } @{$EXPORT_TAGS{$_}} foreach keys %EXPORT_TAGS;  
}
```

F<CGI.pm> creates an ":all" tag which contains some  
(but not really  
all) of its categories. That could be done with one small  
change:

```
# add some of the other ":class" tags to the ":all" class,  
# deleting duplicates  
{  
    my %seen;  
  
    push @{$EXPORT_TAGS{all}},  
        grep { !$seen{$_} } @{$EXPORT_TAGS{$_}}  
        foreach qw/html2 html3 netscape form cgi internal/;  
}
```

Note that the tag names in C<%EXPORT\_TAGS> don't have the leading '!'.

## =head2 C<AUTOLOAD>ed Constants

Many modules make use of C<AUTOLOAD>ing for constant subroutines to avoid having to compile and waste memory on rarely used values (see L<perlsub> for details on constant subroutines). Calls to such constant subroutines are not optimized away at compile time because they can't be checked at compile time for constancy.

Even if a prototype is available at compile time, the body of the subroutine is not (it hasn't been C<AUTOLOAD>ed yet). perl needs to examine both the C<()> prototype and the body of a subroutine at compile time to detect that it can safely replace calls to that subroutine with the constant value.

A workaround for this is to call the constants once in a C<BEGIN> block:

```
package My ;

use Socket ;

foo( SO_LINGER ); ## SO_LINGER NOT optimized away; called at runtime
BEGIN { SO_LINGER }
foo( SO_LINGER ); ## SO_LINGER optimized away at compile time.
```

This forces the C<AUTOLOAD> for C<SO\_LINGER> to take place before SO\_LINGER is encountered later in C<My> package.

If you are writing a package that C<AUTOLOAD>s, consider forcing an C<AUTOLOAD> for any constants explicitly imported by other packages or which are usually used when your package is C<use>d.

## =head1 Good Practices

### =head2 Declaring C<@EXPORT\_OK> and Friends

When using C<Exporter> with the standard C<strict> and C<warnings> pragmas, the C<our> keyword is needed to declare the package variables C<@EXPORT\_OK>, C<@EXPORT>, C<@ISA>, etc.

```
our @ISA = qw(Exporter);
our @EXPORT_OK = qw(munge frobnicate);
```

If backward compatibility for Perls under 5.6 is important, one must write instead a C<use vars> statement.

```
use vars qw(@ISA @EXPORT_OK);
```

```
@ISA = qw(Exporter);
@EXPORT_OK = qw(munge frobnicate);
```

=head2 Playing Safe

There are some caveats with the use of runtime statements like `C<require Exporter>` and the assignment to package variables, which can be very subtle for the unaware programmer. This may happen for instance with mutually recursive modules, which are affected by the time the relevant constructions are executed.

The ideal (but a bit ugly) way to never have to think about that is to use `C<BEGIN>` blocks. So the first part of the `L</SYNOPSIS>` code could be rewritten as:

```
package YourModule;

use strict;
use warnings;

our (@ISA, @EXPORT_OK);
BEGIN {
    require Exporter;
    @ISA = qw(Exporter);
    @EXPORT_OK = qw(munge frobnicate); # symbols to export on request
}
```

The `C<BEGIN>` will assure that the loading of `F<Exporter.pm>` and the assignments to `C<@ISA>` and `C<@EXPORT_OK>` happen immediately, leaving no room for something to get awry or just plain wrong.

With respect to loading `C<Exporter>` and inheriting, there are alternatives with the use of modules like `C<base>` and `C<parent>`.

```
use base qw( Exporter );
# or
use parent qw( Exporter );
```

Any of these statements are nice replacements for `C<BEGIN { require Exporter; @ISA = qw(Exporter); }>` with the same compile-time effect. The basic difference is that `C<base>` code interacts with declared `C<fields>` while `C<parent>` is a streamlined version of the older `C<base>` code to just establish the IS-A relationship.

For more details, see the documentation and code of L<base> and L<parent>.

Another thorough remedy to that runtime vs. compile-time trap is to use L<Exporter::Easy>, which is a wrapper of Exporter that allows all boilerplate code at a single gulp in the use statement.

```
use Exporter::Easy (
    OK => [ qw(munge frobnicate) ],
);
# @ISA setup is automatic
# all assignments happen at compile time
```

=head2 What Not  
to Export

You have been warned already in L</Selecting What to Export>  
to not export:

=over 4

=item \*

method names (because you don't need to  
and that's likely to not do what you want),

=item \*

anything by default (because you don't want to surprise your users...  
badly)

=item \*

anything you don't need to (because less is more)

=back

There's one more item to add to this list. Do B<not>  
export variable names. Just because C<Exporter> lets you  
do that, it does not mean you should.

```
@EXPORT_OK = qw( $svar @avar %hvar ); # DON'T!
```

Exporting variables is not a good idea. They can  
change under the hood, provoking horrible  
effects at-a-distance, that are too hard to track

and to fix. Trust me: they are not worth it.

To provide the capability to set/get class-wide settings, it is best instead to provide accessors as subroutines or class methods instead.

=head1 SEE ALSO

C<Exporter> is definitely not the only module with symbol exporter capabilities. At CPAN, you may find a bunch of them. Some are lighter. Some provide improved APIs and features. Peek the one that fits your needs. The following is a sample list of such modules.

- Exporter::Easy
- Exporter::Lite
- Exporter::Renaming
- Exporter::Tidy
- Sub::Exporter / Sub::Installer
- Perl6::Export / Perl6::Export::Attrs

NAME

Exporter - Implements default import method for modules

SYNOPSIS

In module YourModule.pm:

```
package YourModule;
require Exporter;
@ISA = qw(Exporter);
@EXPORT_OK = qw(munge frobnicate); # symbols to export on request
```

or

```
package YourModule;
use Exporter 'import'; # gives you Exporter's import() method directly
@EXPORT_OK = qw(munge frobnicate); # symbols to export on request
```

In other files which wish to use "YourModule":

```
use YourModule qw(frobnicate); # import listed symbols
frobnicate ($left, $right) # calls YourModule::frobnicate
```

Take a look at "Good Practices" for some variants you will like to use in modern Perl code.

## DESCRIPTION

The Exporter module implements an "import" method which allows a module to export functions and variables to its users' namespaces. Many modules use Exporter rather than implementing their own "import" method because Exporter provides a highly flexible interface, with an implementation optimised for the common case.

Perl automatically calls the "import" method when processing a "use" statement for a module. Modules and "use" are documented in perlfunc and perlmod. Understanding the concept of modules and how the "use" statement operates is important to understanding the Exporter.

## How to Export

The arrays @EXPORT and @EXPORT\_OK in a module hold lists of symbols that are going to be exported into the users name space by default, or which they can request to be exported, respectively. The symbols can represent functions, scalars, arrays, hashes, or typeglobs. The symbols must be given by full name with the exception that the ampersand in front of a function is optional, e.g.

```
@EXPORT = qw(afunc $scalar @array); # afunc is a function
@EXPORT_OK = qw(&bfunc %hash *typeglob); # explicit prefix
on &bfunc
```

If you are only exporting function names it is recommended to omit the ampersand, as the implementation is faster this way.

## Selecting What To Export

Do not export method names!

Do not export anything else by default without a good reason!

Exports pollute the namespace of the module user. If you must export try to use `@EXPORT_OK` in preference to `@EXPORT` and avoid short or common symbol names to reduce the risk of name clashes.

Generally anything not exported is still accessible from outside the module using the `"YourModule::item_name"` (or `"$blessed_ref->method"`) syntax. By convention you can use a leading underscore on names to informally indicate that they are 'internal' and not for public use.

(It is actually possible to get private functions by saying:

```
my $subref = sub { ... };
$subref->(@args);      # Call it as a function
$obj->$subref(@args);  # Use it as a method
```

However if you use them for methods it is up to you to figure out how to make inheritance work.)

As a general rule, if the module is trying to be object oriented then export nothing. If it's just a collection of functions then `@EXPORT_OK` anything but use `@EXPORT` with caution. For function and method names use barewords in preference to names prefixed with ampersands for the export lists.

Other module design guidelines can be found in `perlmod`.

#### How to Import

In other files which wish to use your module there are three basic ways for them to load your module and import its symbols:

```
"use YourModule;"
```

This imports all the symbols from `YourModule`'s `@EXPORT` into the namespace of the `"use"` statement.

```
"use YourModule ();"
```

This causes perl to load your module but does not import any symbols.

```
"use YourModule qw(...);"
```

This imports only the symbols listed by the caller into their namespace. All listed symbols

must be in your `@EXPORT` or `@EXPORT_OK`,

else an error occurs. The advanced export features of `Exporter` are

accessed like this, but with list entries that are syntactically distinct from symbol names.

Unless you want to use its advanced features, this is probably all you need to know to use Exporter.

#### Advanced features

##### Specialised Import Lists

If any of the entries in an import list begins with `!`, `:` or `/` then the list is treated as a series of specifications which either add to or delete from the list of names to import. They are processed left to right. Specifications are in the form:

```
[!]name      This name only
[!]:DEFAULT  All names in @EXPORT
[!]:tag      All names in $EXPORT_TAGS{tag} anonymous list
[!]/pattern/ All names in @EXPORT and @EXPORT_OK which match
```

A leading `!` indicates that matching names should be deleted from the list of names to import. If the first specification is a deletion it is

treated as though preceded by `:DEFAULT`. If you just want to import extra names in addition to the default set you will still need to include `:DEFAULT` explicitly.

e.g., `Module.pm` defines:

```
@EXPORT      = qw(A1 A2 A3 A4 A5);
@EXPORT_OK   = qw(B1 B2 B3 B4 B5);
%EXPORT_TAGS = (T1 => [qw(A1 A2 B1 B2)], T2 => [qw(A1 A2 B3 B4)]);
```

Note that you cannot use tags in `@EXPORT` or `@EXPORT_OK`. Names in `EXPORT_TAGS` must also appear in `@EXPORT` or `@EXPORT_OK`.

An application using `Module` can say something like:

```
use Module qw(:DEFAULT :T2 !B3 A3);
```

Other examples include:

```
use Socket qw(!^[AP]F_ !SOMAXCONN !SOL_SOCKET);
use POSIX qw(:errno_h :termios_h !TCSADRAIN !^EXIT/);
```

Remember that most patterns (using `//`) will need to be anchored with a leading `^`, e.g., `"/^EXIT/"` rather than `"/EXIT/"`.

You can say `"BEGIN { $Exporter::Verbose=1 }"` to see how the specifications are being

processed and what is actually being imported into modules.

Exporting without using Exporter's import method

Exporter has a special method, 'export\_to\_level' which is used in situations where you can't directly call Exporter's import method. The export\_to\_level method looks like:

```
MyPackage->export_to_level($where_to_export, $package, @what_to_export);
```

where \$where\_to\_export is an integer telling how far up the calling stack to export your symbols, and @what\_to\_export is an array telling what symbols \*to\* export (usually this is @\_). The \$package argument is currently unused.

For example, suppose that you have a module, A, which already has an import function:

```
package A;

@ISA = qw(Exporter);
@EXPORT_OK = qw ($b);

sub import
{
    $A::b = 1;  # not a very useful import method
}
```

and you want to Export symbol \$A::b back to the module that called package A. Since

Exporter relies on the import method to work, via inheritance, as it stands Exporter::import() will never get called.

Instead, say the following:

```
package A;
@ISA = qw(Exporter);
@EXPORT_OK = qw ($b);

sub import
{
    $A::b = 1;
    A->export_to_level(1, @_);
}
```

This will export the symbols one level 'above' the current package - ie: to the program or module that used package A.

Note: Be careful not to modify @\_ at all before you call export\_to\_level

- or people using your package will get very unexplained results!

#### Exporting without inheriting from Exporter

By including Exporter in your @ISA you inherit an Exporter's import() method but you also inherit several other helper methods which you probably don't want. To avoid this you can do

```
package YourModule;  
use Exporter qw( import );
```

which will export Exporter's own import() method into YourModule.

Everything will

work as before but you won't need to include Exporter in

```
@YourModule::ISA.
```

Note: This feature was introduced in version 5.57 of Exporter, released with perl 5.8.3.

#### Module Version Checking

The Exporter module will convert an attempt to import a number from a module into a call to "\$module\_name->require\_version(\$value)". This can be used to validate that the version of the module being used is greater than or equal to the required version.

The Exporter module supplies a default "require\_version" method which checks the value of \$VERSION in the exporting module.

Since the default "require\_version" method treats the \$VERSION number as a simple numeric value it will regard version 1.10 as lower than 1.9.

For this reason it is strongly recommended that you use numbers with at least two decimal places, e.g., 1.09.

#### Managing Unknown Symbols

In some situations you may want to prevent certain symbols from being exported. Typically

this applies to extensions which have functions or constants that may not exist on some systems.

The names of any symbols that cannot be exported should be listed in the @EXPORT\_FAIL array.

If a module attempts to import any of these symbols the Exporter will give the module an opportunity to handle the situation before generating an error. The Exporter will call an export\_fail method with a list of the failed symbols:

```
@failed_symbols = $module_name->export_fail(@failed_symbols);
```

If the "export\_fail" method returns an empty list then no error is recorded and all the requested symbols are exported. If the returned list is not empty then an error is generated for each symbol and the export fails. The Exporter provides a default "export\_fail" method which simply returns the list unchanged.

Uses for the "export\_fail" method include giving better error messages for some symbols and performing lazy architectural checks (put more symbols into @EXPORT\_FAIL by default and then take them out if someone actually tries to use them and an expensive check shows that they are usable on that platform).

#### Tag Handling Utility Functions

Since the symbols listed within %EXPORT\_TAGS must also appear in either @EXPORT or @EXPORT\_OK, two utility functions are provided which allow you to easily add tagged sets of symbols to @EXPORT or @EXPORT\_OK:

```
%EXPORT_TAGS = (foo => [qw(aa bb cc)], bar => [qw(aa cc dd)]);
```

```
Exporter::export_tags('foo'); # add aa, bb and cc to @EXPORT
Exporter::export_ok_tags('bar'); # add aa, cc and dd to @EXPORT_OK
```

Any names which are not tags are added to @EXPORT or @EXPORT\_OK unchanged but will trigger a warning (with "-w") to avoid misspelt tags names being silently added to @EXPORT or @EXPORT\_OK. Future versions may make this a fatal error.

#### Generating combined tags

If several symbol categories exist in %EXPORT\_TAGS, it's usually useful to create the utility ":all" to simplify "use" statements.

The simplest way to do this is:

```
%EXPORT_TAGS = (foo => [qw(aa bb cc)], bar => [qw(aa cc dd)]);

# add all the other ":class" tags to the ":all" class,
# deleting duplicates
{
    my %seen;

    push @{$EXPORT_TAGS{all}},
        grep { !$seen{$_}++ } @{$EXPORT_TAGS{$_}} foreach keys %EXPORT_TAGS;
}
```

CGI.pm creates an ":all" tag which contains some (but not really all) of its categories. That could be done with one small change:

```

# add some of the other ":class" tags to the ":all" class,
# deleting duplicates
{
  my %seen;

  push @{$EXPORT_TAGS{all}},
    grep { !$seen{$_}++ } @{$EXPORT_TAGS{$_}}
    foreach qw/html2 html3 netscape form cgi internal/;
}

```

Note that the tag names in %EXPORT\_TAGS don't have the leading '!'.

#### "AUTOLOAD"ed Constants

Many modules make use of "AUTOLOAD"ing for constant subroutines to avoid having to compile and waste memory on rarely used values (see perlsub for details on constant subroutines). Calls to such constant subroutines are not optimized away at compile time because they can't be checked at compile time for constancy.

Even if a prototype is available at compile time, the body of the subroutine is not (it hasn't been "AUTOLOAD"ed yet). perl needs to examine both the "()" prototype and the body of a subroutine at compile time to detect that it can safely replace calls to that subroutine with the constant value.

A workaround for this is to call the constants once in a "BEGIN" block:

```

package My ;

use Socket ;

foo( SO_LINGER );  ## SO_LINGER NOT optimized away; called at runtime
BEGIN { SO_LINGER }
foo( SO_LINGER );  ## SO_LINGER optimized away at compile time.

```

This forces the "AUTOLOAD" for "SO\_LINGER" to take place before SO\_LINGER is encountered later in "My" package.

If you are writing a package that "AUTOLOAD"s, consider forcing an "AUTOLOAD" for any constants explicitly imported by other packages or which are usually used when your package is "use"d.

#### Good Practices

##### Declaring @EXPORT\_OK and Friends

When using "Exporter" with the standard "strict" and "warnings" pragmas,

the "our" keyword is needed to declare the package variables @EXPORT\_OK, @EXPORT, @ISA, etc.

```
our @ISA = qw(Exporter);
our @EXPORT_OK = qw(munge frobnicate);
```

If backward compatibility for Perls under 5.6 is important, one must write instead a "use vars" statement.

```
use vars qw(@ISA @EXPORT_OK);
@ISA = qw(Exporter);
@EXPORT_OK = qw(munge frobnicate);
```

### Playing Safe

There are some caveats with the use of runtime statements like "require Exporter" and the assignment to package variables, which can be very subtle for the unaware programmer. This may happen for instance with mutually recursive modules, which are affected by the time the relevant constructions are executed.

The ideal (but a bit ugly) way to never have to think about that is to use "BEGIN" blocks. So the first part of the "SYNOPSIS" code could be rewritten as:

```
package YourModule;

use strict;
use warnings;

our (@ISA, @EXPORT_OK);
BEGIN {
    require Exporter;
    @ISA = qw(Exporter);
    @EXPORT_OK = qw(munge frobnicate); # symbols to export on request
}
```

The "BEGIN" will assure that the loading of Exporter.pm and the assignments to @ISA and @EXPORT\_OK happen immediately, leaving no room for something to get awry or just plain wrong.

With respect to loading "Exporter" and inheriting, there are alternatives with the use of modules like "base" and "parent".

```
use base qw( Exporter );
# or
use parent qw( Exporter );
```

Any of these statements are nice replacements for "BEGIN { require Exporter; @ISA = qw(Exporter); }" with the same compile-time effect. The basic difference is that "base" code interacts with declared "fields" while "parent" is a streamlined version of the older "base" code to just establish the IS-A relationship.

For more details, see the documentation and code of base and parent.

Another thorough remedy to that runtime vs. compile-time trap is to use `Exporter::Easy`, which is a wrapper of `Exporter` that allows all boilerplate code at a single gulp in the use statement.

```
use Exporter::Easy (
    OK => [ qw(munge frobnicate) ],
);
# @ISA setup is automatic
# all assignments happen at compile time
```

#### What not to Export

You have been warned already in "Selecting What To Export" to not export:

- \* method names (because you don't need to and that's likely to not do what you want),
- \* anything by default (because you don't want to surprise your users... badly)
- \* anything you don't need to (because less is more)

There's one more item to add to this list. Do not export variable names. Just because "Exporter" lets you do that, it does not mean you should.

```
@EXPORT_OK = qw( $svar @avar %hvar ); # DON'T!
```

Exporting variables is not a good idea. They can change under the hood, provoking horrible effects at-a-distance, that are too hard to track and to fix. Trust me: they are not worth it.

To provide the capability to set/get class-wide settings, it is best instead to provide accessors as subroutines or class methods instead.

#### SEE ALSO

"Exporter" is definitely not the only module with symbol exporter capabilities. At CPAN, you may find a bunch of them. Some are lighter. Some provide improved APIs and features. Peek the one that fits your

needs. The following is a sample list of such modules.

```
Exporter::Easy
Exporter::Lite
Exporter::Renaming
Exporter::Tidy
Sub::Exporter
/ Sub::Installer
Perl6::Export / Perl6::Export::Attrs
```

=head1 NAME

threads - Perl interpreter-based threads

=head1 VERSION

This document describes threads version 1.87

=head1 SYNOPSIS

```
use threads ('yield',
            'stack_size' => 64*4096,
            'exit' => 'threads_only',
            'stringify');

sub start_thread {
    my @args = @_;
    print("Thread started: ", join(' ', @args), "\n");
}

my $thr = threads->create('start_thread', 'argument');
$thr->join();

threads->create(sub { print("I am a thread\n"); }->join());

my $thr2 = async { foreach (@files) { ... } };
$thr2->join();
if (my $err = $thr2->error()) {
```

```

    warn("Thread error: $err\n");
}

# Invoke thread in list context (implicit) so it can return a list
my ($thr) = threads->create(sub { return (qw/a b c/); });
# or specify list context explicitly
my $thr = threads->create({'context' => 'list'},

    sub { return (qw/a b c/); });
my @results = $thr->join();

$thr->detach();

# Get a thread's object
$thr = threads->self();
$thr = threads->object($tid);

# Get a thread's ID
$tid = threads->tid();
$tid = $thr->tid();
$tid = "$thr";

# Give other threads a chance to run
threads->yield();
yield();

# Lists of non-detached threads
my @threads = threads->list();
my $thread_count = threads->list();

my @running = threads->list(threads::running);
my @joinable = threads->list(threads::joinable);

# Test thread objects
if ($thr1 == $thr2) {
    ...
}

# Manage thread stack size
$stack_size = threads->get_stack_size();
$old_size = threads->set_stack_size(32*4096);

# Create a thread with a specific context and stack size
my $thr = threads->create({ 'context' => 'list',
    'stack_size' => 32*4096,
    'exit' => 'thread_only'
},
    \&foo);

```

```

# Get thread's context
my $wantarray = $thr->wantarray();

# Check thread's state
if ($thr->is_running()) {
    sleep(1);
}
if ($thr->is_joinable()) {
    $thr->join();
}

# Send a signal to a thread
$thr->kill('SIGUSR1');

# Exit a thread
threads->exit();

```

## =head1 DESCRIPTION

Since Perl 5.8, thread programming has been available using a model called `I<interpreter threads>` which provides a new Perl interpreter for each thread, and, by default, results in no data or state information being shared between threads.

(Prior to Perl 5.8, `I<5005threads>` was available through the `C<Thread.pm>` API. This threading model has been deprecated, and was removed as of Perl 5.10.0.)

As just mentioned, all variables are, by default, thread local. To use shared variables, you need to also load `L<threads::shared>`:

```

use threads;
use threads::shared;

```

When loading `L<threads::shared>`, you must `C<use threads>` before you `C<use threads::shared>`. (`C<threads>` will emit a warning if you do it the other way around.)

It is strongly recommended that you enable threads via `C<use threads>` as early as possible in your script.

If needed, scripts can be written so as to run on both threaded and non-threaded Perls:

```

my $can_use_threads = eval 'use threads; 1';
if ($can_use_threads) {
    # Do processing using threads

```

```

...
} else {
  # Do it without using threads
  ...
}

```

=over

=item \$thr = threads->create(FUNCTION, ARGS)

This will create a new thread that will begin execution with the specified entry point function, and give it the I<ARGS> list as parameters. It will return the corresponding threads object, or C<undef> if thread creation failed.

I<FUNCTION> may either be the name of a function, an anonymous subroutine, or a code ref.

```

my $thr = threads->create('func_name', ...);
# or
my $thr = threads->create(sub { ... }, ...);

# or
my $thr = threads->create(\&func, ...);

```

The C<-E<gt>new()> method is an alias for C<-E<gt>create()>.

=item \$thr->join()

This will wait for the corresponding thread to complete its execution. When the thread finishes, C<-E<gt>join()> will return the return value(s) of the entry point function.

The context (void, scalar or list) for the return value(s) for C<-E<gt>join()> is determined at the time of thread creation.

```

# Create thread in list context (implicit)
my ($thr1) = threads->create(sub {
    my @results = qw(a b c);
    return (@results);
});
# or (explicit)
my $thr1 = threads->create({'context' => 'list'},
    sub {
        my @results = qw(a b c);
        return (@results);
    });
# Retrieve list results from thread
my @res1 = $thr1->join();

```

```

# Create thread in scalar context (implicit)
my $thr2 = threads->create(sub {
    my $result = 42;
    return ($result);
});

# Retrieve scalar result from thread
my $res2 = $thr2->join();

# Create a thread in void context (explicit)
my $thr3 = threads->create({'void' => 1},
    sub { print("Hello, world\n"); });
# Join the thread in void context (i.e., no return value)
$thr3->join();

```

See L<"THREAD CONTEXT"> for more details.

If the program exits without all threads having either been joined or detached, then a warning will be issued.

Calling C<-E<gt>join()> or C<-E<gt>detach()> on an already joined thread will cause an error to be thrown.

=item \$thr->detach()

Makes the thread unjoinable, and causes any eventual return value to be discarded. When the program exits, any detached threads that are still running are silently terminated.

If the program exits without all threads having either been joined or detached, then a warning will be issued.

Calling C<-E<gt>join()> or C<-E<gt>detach()> on an already detached thread will cause an error to be thrown.

=item threads->detach()

Class method that allows a thread to detach itself.

=item threads->self()

Class method that allows a thread to obtain its own I<threads> object.

=item \$thr->tid()

Returns the ID of the thread. Thread IDs are unique integers with the main thread in a program being 0, and incrementing by 1 for every thread created.

=item threads->tid()

Class method that allows a thread to obtain its own ID.

=item "\$thr"

If you add the C<stringify> import option to your C<use threads> declaration, then using a threads object in a string or a string context (e.g., as a hash key) will cause its ID to be used as the value:

```
use threads qw(stringify);

my $thr = threads->create(...);
print("Thread $thr started...\n"); # Prints
out: Thread 1 started...
```

=item threads->object(\$tid)

This will return the I<threads> object for the I<active> thread associated with the specified thread ID. If C<\$tid> is the value for the current thread, then this call works the same as C<-E<gt>self()>. Otherwise, returns C<undef> if there is no thread associated with the TID, if the thread is joined or detached, if no TID is specified or if the specified TID is undef.

=item threads->yield()

This is a suggestion to the OS to let this thread yield CPU time to other threads. What actually happens is highly dependent upon the underlying thread implementation.

You may do C<use threads qw(yield)>, and then just use C<yield()> in your code.

=item threads->list()

=item threads->list(threads::all)

=item threads->list(threads::running)

=item threads->list(threads::joinable)

With no arguments (or using C<threads::all>) and in a list context, returns a list of all non-joined, non-detached I<threads> objects. In a scalar context, returns a count of the same.

With a I<true> argument (using C<threads::running>), returns a list of all

non-joined, non-detached I<threads> objects that are still running.

With a I<false> argument (using C<threads::joinable>), returns a list of all non-joined, non-detached I<threads> objects that have finished running (i.e., for which C<-E<gt>join()> will not I<block>).

=item \$thr1->equal(\$thr2)

Tests if two threads objects are the same thread or not. This is overloaded to the more natural forms:

```
if ($thr1 == $thr2) {
    print("Threads are the same\n");
}
# or
if ($thr1 != $thr2) {
    print("Threads differ\n");
}
```

(Thread comparison is based on thread IDs.)

=item async BLOCK;

C<async> creates a thread to execute the block immediately following it. This block is treated as an anonymous subroutine, and so must have a semicolon after the closing brace. Like C<threads-E<gt>create()>, C<async> returns a I<threads> object.

=item \$thr->error()

Threads

are executed in an C<eval> context. This method will return C<undef> if the thread terminates I<normally>. Otherwise, it returns the value of C<\$@> associated with the thread's execution status in its C<eval> context.

=item \$thr->\_handle()

This I<private> method returns the memory location of the internal thread structure associated with a threads object. For Win32, this is a pointer to the C<HANDLE> value returned by C<CreateThread> (i.e., C<HANDLE \*>); for other platforms, it is a pointer to the C<pthread\_t> structure used in the C<pthread\_create> call (i.e., C<pthread\_t \*>).

This method is of no use for general Perl threads programming. Its intent is to provide other (XS-based) thread modules with the capability to access, and possibly manipulate, the underlying thread structure associated with a Perl thread.

=item threads->\_handle()

Class method that allows a thread to obtain its own I<handle>.

=back

=head1 EXITING A THREAD

The usual method for terminating a thread is

to

L<return()|perlfunc/"return EXPR"> from the entry point function with the appropriate return value(s).

=over

=item threads->exit()

If needed, a thread can be exited at any time by calling

C<threads-E<gt>exit()>. This will cause the thread to return C<undef> in a scalar context, or the empty list in a list context.

When called from the I<main> thread, this behaves the same as C<exit(0)>.

=item threads->exit(status)

When called from a thread, this behaves like C<threads-E<gt>exit()> (i.e., the exit status code is ignored).

When called from the I<main> thread, this behaves the same as C<exit(status)>.

=item die()

Calling C<die()> in a thread indicates an abnormal exit for the thread. Any C<\${SIG{\_\_DIE\_\_}}> handler in the thread will be called first, and then the thread will exit with a warning message that will contain any arguments passed in the C<die()> call.

=item exit(status)

Calling L<exit()|perlfunc/"exit EXPR"> inside a thread causes the whole application to terminate.

Because of this, the use of C<exit()> inside threaded code, or in modules that might be used in threaded applications, is strongly discouraged.

If C<exit()> really is needed, then consider using the following:

```
threads->exit() if threads->can('exit'); # Thread friendly
```

```
exit(status);
```

=item use threads 'exit' => 'threads\_only'

This globally overrides the default behavior of calling `C<exit()>` inside a thread, and effectively causes such calls to behave the same as `C<threads-E<gt>exit()>`. In other words, with this setting, calling `C<exit()>` causes only the thread to terminate.

Because of its global effect, this setting should not be used inside modules or the like.

The `I<main>` thread is unaffected by this setting.

```
=item threads->create({'exit' => 'thread_only'}, ...)
```

This overrides the default behavior of `C<exit()>` inside the newly created thread only.

```
=item $thr->set_thread_exit_only(boolean)
```

This can be used to change the `I<exit thread only>` behavior for a thread after it has been created. With a `I<true>` argument, `C<exit()>` will cause only the thread to exit. With a `I<false>` argument, `C<exit()>` will terminate the application.

The `I<main>` thread is unaffected by this call.

```
=item threads->set_thread_exit_only(boolean)
```

Class method for use inside a thread to change its own behavior for `C<exit()>`.

The `I<main>` thread is unaffected by this call.

```
=back
```

```
=head1 THREAD STATE
```

The following boolean methods are useful in determining the `I<state>` of a thread.

```
=over
```

```
=item $thr->is_running()
```

Returns true if a thread is still running (i.e., if its entry point function has not yet finished or exited).

=item \$thr->is\_joinable()

Returns true if the thread has finished running, is not detached and has not yet been joined. In other words, the thread is ready to be joined, and a call to C<\$thr-E<gt>join()> will not I<block>.

=item \$thr->is\_detached()

Returns true if the thread has been detached.

=item threads->is\_detached()

Class method that allows a thread to determine whether or not it is detached.

=back

=head1 THREAD CONTEXT

As with subroutines, the type of value returned from a thread's entry point function may be determined by the thread's I<context>: list, scalar or void. The thread's context is determined at thread creation. This is necessary so that the context is available to the entry point function via L<wantarray()|perlfunc/"wantarray">. The thread may then specify a value of the appropriate type to be returned from C<-E<gt>join()>.

=head2 Explicit context

Because thread creation and thread joining may occur in different contexts, it may be desirable to state the context explicitly to the thread's entry point function. This may be done by calling C<-E<gt>create()> with a hash reference as the first argument:

```
my $thr = threads->create({'context' => 'list'}, \&foo);
...
my @results = $thr->join();
```

In the above, the threads object is returned to the parent thread in scalar context, and the thread's entry point function C<foo> will be called in list (array) context such that the parent thread can receive a list (array) from the C<-E<gt>join()> call. (C<'array'> is synonymous with C<'list'>.)

Similarly, if you need the threads object, but your thread will not be returning a value (i.e., I<void> context), you would do the following:

```
my $thr = threads->create({'context' => 'void'}, \&foo);
```

```
...  
$thr->join();
```

The context type may also be used as the I<key> in the hash reference followed by a I<true> value:

```
threads->create({'scalar' => 1}, \&foo);  
...  
my ($thr) = threads->list();  
my $result = $thr->join();
```

## =head2 Implicit context

If not explicitly stated, the thread's context is implied from the context of the C<-E<gt>create()> call:

```
# Create thread in list context  
my ($thr) = threads->create(...);  
  
# Create thread in scalar context  
my $thr = threads->create(...);  
  
# Create thread in void context  
threads->create(...);
```

## =head2

```
$thr->wantarray()
```

This returns the thread's context in the same manner as L<wantarray()|perlfunc/"wantarray">.

## =head2 threads->wantarray()

Class method to return the current thread's context. This returns the same value as running L<wantarray()|perlfunc/"wantarray"> inside the current thread's entry point function.

## =head1 THREAD STACK SIZE

The default per-thread stack size for different platforms varies significantly, and is almost always far more than is needed for most applications. On Win32, Perl's makefile explicitly sets the default stack to 16 MB; on most other platforms, the system default is used, which again may be much larger than is needed.

By tuning the stack size to more accurately reflect your application's needs, you may significantly reduce your application's memory usage, and increase the number of simultaneously running threads.

Note that on Windows, address space allocation granularity is 64 KB, therefore, setting the stack smaller than that on Win32 Perl will not save any more memory.

```
=over
```

```
=item threads->get_stack_size();
```

Returns the current default per-thread stack size. The default is zero, which means the system default stack size is currently in use.

```
=item $size = $thr->get_stack_size();
```

Returns the stack size for a particular thread. A return value of zero indicates the system default stack size was used for the thread.

```
=item $old_size = threads->set_stack_size($new_size);
```

Sets a new default per-thread stack size, and returns the previous setting.

Some platforms have a minimum thread stack size. Trying to set the stack size below this value will result in a warning, and the minimum stack size will be used.

Some Linux platforms have a maximum stack size. Setting too large of a stack size will cause thread creation to fail.

If needed, C<\$new\_size> will be rounded up to the next multiple of the memory page size (usually 4096 or 8192).

Threads created after the stack size is set will then either call

```
C<pthread_attr_setstacksize(>
```

```
I<(for pthreads platforms)>, or supply the  
stack size to C<CreateThread(> I<(for Win32 Perl)>.
```

(Obviously, this call does not affect any currently extant threads.)

```
=item use threads ('stack_size' => VALUE);
```

This sets the default per-thread stack size at the start of the application.

```
=item $ENV{'PERL5_ITHREADS_STACK_SIZE'}
```

The default per-thread stack size may be set at the start of the application through the use of the environment variable C<PERL5\_ITHREADS\_STACK\_SIZE>:

```
PERL5_ITHREADS_STACK_SIZE=1048576
export PERL5_ITHREADS_STACK_SIZE
perl -e'use threads; print(threads->get_stack_size(), "\n")'
```

This value overrides any C<stack\_size> parameter given to C<use threads>. Its primary purpose is to permit setting the per-thread stack size for legacy threaded applications.

```
=item threads->create({'stack_size' => VALUE}, FUNCTION, ARGS)
```

To specify a particular stack size for any individual thread, call C<-E<gt>create()> with a hash reference as the first argument:

```
my $thr = threads->create({'stack_size' => 32*4096}, \&foo, @args);
```

```
=item $thr2 = $thr1->create(FUNCTION, ARGS)
```

This creates a new thread (C<\$thr2>) that inherits the stack size from an existing thread (C<\$thr1>). This is shorthand for the following:

```
my $stack_size = $thr1->get_stack_size();
my $thr2 = threads->create({'stack_size' => $stack_size}, FUNCTION, ARGS);
```

```
=back
```

## =head1 THREAD SIGNALLING

When safe signals is in effect (the default behavior - see L</"Unsafe signals"> for more details), then signals may be sent and acted upon by individual threads.

```
=over 4
```

```
=item $thr->kill('SIG...');
```

Sends the specified signal to the thread. Signal names and (positive) signal numbers are the same as those supported by L<kill()|perlfunc/"kill SIGNAL, LIST">. For example, 'SIGTERM', 'TERM' and (depending on the OS) 15 are all valid arguments to C<-E<gt>kill()>.

Returns the thread object to allow for method chaining:

```
$thr->kill('SIG...')->join();
```

```
=back
```

Signal

handlers need to be set up in the threads for the signals they are expected to act upon. Here's an example for I<cancelling> a thread:

```
use threads;

sub thr_func
{
    # Thread 'cancellation' signal handler
    $SIG{'KILL'} = sub { threads->exit(); };

    ...
}

# Create a thread
my $thr = threads->create('thr_func');

...

# Signal the thread to terminate, and then detach
# it so that it will get cleaned up automatically
$thr->kill('KILL')->detach();
```

Here's another simplistic example that illustrates the use of thread signalling in conjunction with a semaphore to provide rudimentary I<suspend> and I<resume> capabilities:

```
use threads;
use Thread::Semaphore;

sub thr_func
{
    my $sema = shift;

    # Thread 'suspend/resume' signal handler
    $SIG{'STOP'} = sub {
        $sema->down();    # Thread suspended
        $sema->up();      # Thread resumes
    };

    ...
}

# Create
a semaphore and pass it to a thread
my $sema = Thread::Semaphore->new();
my $thr = threads->create('thr_func', $sema);

# Suspend the thread
```

```
$sema->down();  
$thr->kill('STOP');
```

...

```
# Allow the thread to continue  
$sema->up();
```

CAVEAT: The thread signalling capability provided by this module does not actually send signals via the OS. It I<emulates> signals at the Perl-level such that signal handlers are called in the appropriate thread. For example, sending C<\$thr-E<gt>kill('STOP')> does not actually suspend a thread (or the whole process), but does cause a C<\$SIG{'STOP'}> handler to be called in that thread (as illustrated above).

As such, signals that would normally not be appropriate to use in the C<kill()> command (e.g., C<kill('KILL', \$\$)>) are okay to use with the C<-E<gt>kill()> method (again, as illustrated above).

Correspondingly, sending a signal to a thread does not disrupt the operation the thread is currently working on: The signal will be acted upon after the current operation has completed. For instance, if the thread is I<stuck> on an I/O call, sending it a signal will not cause the I/O call to be interrupted such that the signal is acted up immediately.

Sending a signal to a terminated/finished thread is ignored.

=head1 WARNINGS

=over 4

=item Perl exited with active threads:

If the program exits without all threads having either been joined or detached, then this warning will be issued.

NOTE: If the I<main> thread exits, then this warning cannot be suppressed using C<no warnings 'threads';> as suggested below.

=item Thread creation failed: pthread\_create returned #

See the appropriate I<man> page for C<pthread\_create> to determine the actual cause for the failure.

=item Thread # terminated abnormally: ...

A thread terminated in some manner other than just returning from its entry

point function, or by using `C<threads-E<gt>exit()>`. For example, the thread may have terminated because of an error, or by using `C<die>`.

=item Using minimum thread stack size of #

Some platforms have a minimum thread stack size. Trying to set the stack size below this value will result in the above warning, and the stack size will be set to the minimum.

=item Thread creation failed: `pthread_attr_setstacksize(I<SIZE>)` returned 22

The specified `I<SIZE>` exceeds the system's maximum stack size. Use a smaller value for the stack size.

=back

If needed, thread warnings can be suppressed by using:

```
no warnings 'threads';
```

in the appropriate scope.

=head1 ERRORS

=over 4

=item This Perl not built to support threads

The particular copy of Perl that you're trying to use was not built using the `C<useithreads>` configuration option.

Having threads support requires all of Perl and all of the XS modules in the Perl installation to be rebuilt; it is not just a question of adding the `L<threads>` module (i.e., threaded and non-threaded Perls are binary incompatible).

=item Cannot change stack size of an existing thread

The stack size of currently extant threads cannot be changed, therefore, the following results in the above error:

```
$thr->set_stack_size($size);
```

=item Cannot signal threads without safe signals

Safe signals must be in effect to use the `C<-E<gt>kill()>` signalling method.

See [L</"Unsafe signals">](#) for more details.

=item Unrecognized signal name: ...

The particular copy of Perl that you're trying to use does not support the specified signal being used in a `C<-E<gt>kill()` call.

=back

## =head1 BUGS AND LIMITATIONS

Before you consider posting a bug report, please consult, and possibly post a message to the discussion forum to see if what you've encountered is a known problem.

=over

=item Thread-safe modules

See [L<perlmod/"Making your module threadsafe">](#) when creating modules that may be used in threaded applications, especially if those modules use non-Perl data, or XS code.

=item Using non-thread-safe modules

Unfortunately, you may encounter Perl modules that are not `I<thread-safe>`.

For example, they may crash the Perl interpreter during execution, or may dump core on termination. Depending on the module and the requirements of your application, it may be possible to work around such difficulties.

If the module will only be used inside a thread, you can try loading the module from inside the thread entry point function using `C<require>` (and `C<import>` if needed):

```
sub thr_func
{
    require Unsafe::Module
    # Unsafe::Module->import(...);

    ....
}
```

If the module is needed inside the `I<main>` thread, try modifying your application so that the module is loaded (again using `C<require>` and `C<-E<gt>import()`) after any threads are started, and in such a way that no other threads are started afterwards.

If the above does not work, or is not adequate for your application, then file a bug report on [L<http://rt.cpan.org/Public/>](http://rt.cpan.org/Public/) against the problematic module.

#### =item Memory consumption

On most systems, frequent and continual creation and destruction of threads can lead to ever-increasing growth in the memory footprint of the Perl interpreter. While it is simple to just launch threads and then `C<-E<gt>join()>` or `C<-E<gt>detach()>` them, for long-lived applications, it is better to maintain a pool of threads, and to reuse them for the work needed, using `L<queues|Thread::Queue>` to notify threads of pending work. The CPAN distribution of this module contains a simple example (`F<examples/pool_reuse.pl>`) illustrating the creation, use and monitoring of a pool of `I<reusable>` threads.

#### =item Current working directory

On all platforms except MSWin32, the setting for the current working directory is shared among all threads such that changing it in one thread (e.g., using `C<chdir()>`) will affect all the threads in the application.

On MSWin32, each thread maintains its own the current working directory setting.

#### =item Environment variables

Currently, on all platforms except MSWin32, all `I<system>` calls (e.g., using `C<system()>` or back-ticks) made from threads use the environment variable settings from the `I<main>` thread. In other words, changes made to `C<%ENV>` in a thread will not be visible in `I<system>` calls made by that thread.

To work around this, set environment variables as part of the `I<system>` call. For example:

```
my $msg = 'hello';
system("FOO=$msg; echo \ $FOO"); # Outputs 'hello' to STDOUT
```

On MSWin32, each thread maintains its own set of environment variables.

#### =item Catching signals

Signals are `I<caught>` by the main thread (thread ID = 0) of a script. Therefore, setting up signal handlers in threads for purposes other than `L</"THREAD SIGNALLING">` as documented above will not accomplish what is intended.

This is especially true if trying to catch C<SIGALRM> in a thread. To handle alarms in threads, set up a signal handler in the main thread, and then use L</"THREAD SIGNALLING"> to relay the signal to the thread:

```
# Create thread with a task that may time out
my $thr->create(sub {
    threads->yield();
    eval {
        $SIG{ALRM} = sub { die("Timeout\n"); };
        alarm(10);
        ... # Do work here
        alarm(0);
    };
    if ($@ =~ /Timeout/) {
        warn("Task in thread timed out\n");
    }
});

# Set signal handler to relay SIGALRM to thread
$SIG{ALRM} = sub { $thr->kill('ALRM') };

... # Main thread continues working
```

=item Parent-child threads

On some platforms, it might not be possible to destroy I<parent> threads while there are still existing I<child> threads.

=item Creating threads inside special blocks

Creating threads inside C<BEGIN>, C<CHECK> or C<INIT> blocks should not be relied upon. Depending on the Perl version and the application code, results may range from success, to (apparently harmless) warnings of leaked scalar, or all the way up to crashing of the Perl interpreter.

=item Unsafe signals

Since Perl 5.8.0, signals have been made safer in Perl by postponing their handling

until the interpreter is in a I<safe> state. See L<perl58delta/"Safe Signals"> and L<perlipc/"Deferred Signals (Safe Signals)"> for more details.

Safe signals is the default behavior, and the old, immediate, unsafe signalling behavior is only in effect in the following situations:

=over 4

=item \* Perl has been built with C<PERL\_OLD\_SIGNALS> (see C<perl -V>).

=item \* The environment variable C<PERL\_SIGNALS> is set to C<unsafe> (see L<perlrun/"PERL\_SIGNALS">).

=item \* The module L<Perl::Unsafe::Signals> is used.

=back

If unsafe signals is in effect, then signal handling is not thread-safe, and the C<-E<gt>kill()> signalling method cannot be used.

=item Returning closures from threads

Returning closures from threads should not be relied upon. Depending on the Perl version and the application code, results may range from success, to (apparently harmless) warnings of leaked scalar, or all the way up to crashing of the Perl interpreter.

=item Returning objects from threads

Returning

objects from threads does not work. Depending on the classes involved, you may be able to work around this by returning a serialized version of the object (e.g., using L<Data::Dumper> or L<Storable>), and then reconstituting it in the joining thread. If you're using Perl 5.10.0 or later, and if the class supports L<shared objects|threads::shared/"OBJECTS">, you can pass them via L<shared queues|Thread::Queue>.

=item END blocks in threads

It is possible to add L<END blocks|perlmod/"BEGIN, UNITCHECK, CHECK, INIT and END"> to threads by using L<require|perlfunc/"require VERSION"> or L<eval|perlfunc/"eval EXPR"> with the appropriate code. These C<END> blocks will then be executed when the thread's interpreter is destroyed (i.e., either during a C<-E<gt>join()> call, or at program termination).

However, calling any L<threads> methods in such an C<END> block will most likely I<fail> (e.g., the application may hang, or generate an error) due to mutexes that are needed to control functionality within the L<threads> module.

For this reason, the use of C<END> blocks in threads is B<strongly> discouraged.

=item Open directory handles

In perl 5.14 and higher, on systems other than Windows that do not support the C<fchdir> C function, directory handles (see

L<[opendir|perlfunc/"opendir DIRHANDLE,EXPR">](#)) will not be copied to new threads. You can use the C<[d\\_fchdir](#)> variable in L<[Config.pm|Config](#)> to determine whether your system supports it.

In prior perl versions, spawning threads with open directory handles would crash the interpreter.

L<[perl #75154](#)||<http://rt.perl.org/rt3/Public/Bug/Display.html?id=75154>>

=item Perl Bugs and the CPAN Version of L<[threads](#)>

Support for threads extends beyond the code in this module (i.e., F<[threads.pm](#)> and F<[threads.xs](#)>), and into the Perl interpreter itself. Older versions of Perl contain bugs that may manifest themselves despite using the latest version of L<[threads](#)> from CPAN. There is no workaround for this other than upgrading to the latest version of Perl.

Even with the latest version of Perl, it is known that certain constructs with threads may result in warning messages concerning leaked scalars or unreferenced scalars. However, such warnings are harmless, and may safely be ignored.

You can search for L<[threads](#)> related bug reports at L<<http://rt.cpan.org/Public/>>. If needed submit any new bugs, problems, patches, etc. to: L<<http://rt.cpan.org/Public/Dist/Display.html?Name=threads>>

NAME

HTTP::Date - date conversion routines

## SYNOPSIS

use HTTP::Date;

```
$string = time2str($time); # Format as GMT ASCII time  
$time = str2time($string); # convert ASCII date to machine time
```

## DESCRIPTION

This module provides functions that deal the date formats used by the HTTP protocol (and then some more). Only the first two functions, `time2str()` and `str2time()`, are exported by default.

`time2str( [$time] )`

The `time2str()` function converts a machine time (seconds since epoch) to a string. If the function is called without an argument or with an undefined argument, it will use the current time.

The string returned is in the format preferred for the HTTP protocol. This is a fixed length subset of the format defined by RFC 1123, represented in Universal Time (GMT). An example of a time stamp in this format is:

```
Sun,  
06 Nov 1994 08:49:37 GMT
```

`str2time( $str [, $zone] )`

The `str2time()` function converts a string to machine time. It returns ``undef`` if the format of `$str` is unrecognized, otherwise whatever the ``Time::Local`` functions can make out of the parsed time. Dates before the system's epoch may not work on all operating systems. The time formats recognized are the same as for `parse_date()`.

The function also takes an optional second argument that specifies the default time zone to use when converting the date. This parameter is ignored if the zone is found in the date string itself. If this parameter is missing, and the date string format does not contain any zone specification, then the local time zone is assumed.

If the zone is not `"GMT"` or numerical (like `"-0800"` or `"+0100"`), then the ``Time::Zone`` module must be installed in order to get the date recognized.

`parse_date( $str )`

This function will try to parse a date string, and then return it as a list of numerical values followed by a (possible undefined) time zone specifier; (`$year`, `$month`, `$day`, `$hour`, `$min`, `$sec`, `$tz`). The

\$year returned will not have the number 1900 subtracted from it and the \$month numbers start with 1.

In scalar context the numbers are interpolated in a string of the "YYYY-MM-DD hh:mm:ss TZ"-format and returned.

If the date is unrecognized, then the empty list is returned.

The function is able to parse the following formats:

```
"Wed, 09 Feb 1994 22:23:32 GMT"    -- HTTP format
"Thu Feb  3 17:03:55 GMT 1994"    -- ctime(3) format
"Thu Feb  3 00:00:00 1994",        -- ANSI C asctime() format
"Tuesday, 08-Feb-94 14:15:29 GMT" -- old rfc850 HTTP format
"Tuesday, 08-Feb-1994 14:15:29 GMT" -- broken rfc850 HTTP format

"03/Feb/1994:17:03:55
-0700" -- common logfile format
"09 Feb 1994 22:23:32 GMT" -- HTTP format (no weekday)
"08-Feb-94 14:15:29 GMT" -- rfc850 format (no weekday)
"08-Feb-1994 14:15:29 GMT" -- broken rfc850 format (no weekday)

"1994-02-03 14:15:29 -0100" -- ISO 8601 format
"1994-02-03 14:15:29" -- zone is optional
"1994-02-03" -- only date
"1994-02-03T14:15:29" -- Use T as separator
"19940203T141529Z" -- ISO 8601 compact format
"19940203" -- only date

"08-Feb-94" -- old rfc850 HTTP format (no weekday, no time)
"08-Feb-1994" -- broken rfc850 HTTP format (no weekday, no time)
"09 Feb 1994" -- proposed new HTTP format (no weekday, no time)
"03/Feb/1994" -- common logfile format (no time, no offset)

"Feb  3 1994" -- Unix 'ls -l' format
"Feb  3 17:03"
-- Unix 'ls -l' format

"11-15-96 03:52PM" -- Windows 'dir' format
```

The parser ignores leading and trailing whitespace. It also allow the seconds to be missing and the month to be numerical in most formats.

If the year is missing, then we assume that the date is the first matching date \*before\* current month. If the year is given with only 2 digits, then parse\_date() will select the century that makes the year closest to the current date.

time2iso( [\$time] )

Same as time2str(), but returns a "YYYY-MM-DD hh:mm:ss"-formatted string representing time in the local time zone.

time2isoz( [\$time] )

Same as time2str(), but returns a "YYYY-MM-DD hh:mm:ssZ"-formatted string representing Universal Time.

=head1 NAME

HTTP::Date - date conversion routines

=head1 SYNOPSIS

use HTTP::Date;

\$string = time2str(\$time); # Format as GMT ASCII time

\$time = str2time(\$string); # convert ASCII date to machine time

## =head1 DESCRIPTION

This module provides functions that deal the date formats used by the HTTP protocol (and then some more). Only the first two functions, `time2str()` and `str2time()`, are exported by default.

=over 4

=item `time2str( [$time] )`

The `time2str()` function converts a machine time (seconds since epoch) to a string. If the function is called without an argument or with an undefined argument, it will use the current time.

The string returned is in the format preferred for the HTTP protocol. This is a fixed length subset of the format defined by RFC 1123, represented in Universal Time (GMT). An example of a time stamp in this format is:

```
Sun, 06 Nov 1994 08:49:37 GMT
```

=item `str2time( $str [, $zone] )`

The `str2time()` function converts a string to machine time. It returns `C<undef>` if the format of `$str` is unrecognized, otherwise whatever the `C<Time::Local>` functions can make out of the parsed time. Dates before the system's epoch may not work on all operating systems. The time formats recognized are the same as for `parse_date()`.

The function also takes an optional second argument that specifies the default time zone to use when converting the date. This parameter is ignored if the zone is found in the date string itself. If this parameter is missing, and the date string format does not contain any zone specification, then the local time zone is assumed.

If the zone is not "C<GMT>" or numerical (like "C<-0800>" or "C<+0100>"), then the `C<Time::Zone>` module must be installed in order to get the date recognized.

=item `parse_date( $str )`

This function will try to parse a date string, and then return it as a list of numerical values followed by a (possible undefined) time zone specifier; (`$year`, `$month`, `$day`, `$hour`, `$min`, `$sec`, `$tz`). The `$year` will be the full 4-digit year, and `$month` numbers start with 1 (for January).

In scalar context the numbers are interpolated in a string of the "YYYY-MM-DD hh:mm:ss TZ"-format and returned.

If the date is unrecognized, then the empty list is returned (C<undef> in scalar context).

The function is able to parse the following formats:

```
"Wed, 09 Feb 1994 22:23:32 GMT"    -- HTTP format
"Thu Feb  3 17:03:55 GMT 1994"     -- ctime(3) format
"Thu Feb  3 00:00:00 1994",        -- ANSI C asctime() format
"Tuesday, 08-Feb-94 14:15:29 GMT"  -- old rfc850 HTTP format
"Tuesday, 08-Feb-1994 14:15:29 GMT" -- broken rfc850 HTTP format

"03/Feb/1994:17:03:55 -0700"       -- common logfile format
"09 Feb 1994 22:23:32 GMT"         -- HTTP format (no weekday)
"08-Feb-94 14:15:29 GMT"          -- rfc850 format (no weekday)
"08-Feb-1994 14:15:29 GMT"        -- broken rfc850 format (no weekday)

"1994-02-03 14:15:29 -0100"
  -- ISO 8601 format
"1994-02-03 14:15:29"             -- zone is optional
"1994-02-03"                      -- only date
"1994-02-03T14:15:29"            -- Use T as separator
"19940203T141529Z"               -- ISO 8601 compact format
"19940203"                       -- only date

"08-Feb-94"                       -- old rfc850 HTTP format (no weekday, no time)
"08-Feb-1994"                     -- broken rfc850 HTTP format (no weekday, no time)
"09 Feb 1994"                     -- proposed new HTTP format (no weekday, no time)
"03/Feb/1994"                     -- common logfile format (no time, no offset)

"Feb  3 1994"                     -- Unix 'ls -l' format
"Feb  3 17:03"                    -- Unix 'ls -l' format
```

```
"11-15-96 03:52PM" -- Windows 'dir' format
```

The parser ignores leading and trailing whitespace. It also allow the seconds to be missing and the month to be numerical in most formats.

If the year is missing, then we assume that the date is the first matching date I<before> current month. If the year is given with only 2 digits, then parse\_date() will select the century that makes the year closest to the current date.

```
=item time2iso( [$time] )
```

Same as `time2str()`, but returns a "YYYY-MM-DD hh:mm:ss"-formatted string representing time in the local time zone.

=item `time2isoz( [$time] )`

Same as `time2str()`, but returns a "YYYY-MM-DD hh:mm:ssZ"-formatted string representing Universal Time.

=head1 NAME

LWP::MediaTypes - guess media type for a file or a URL

=head1 SYNOPSIS

```
use LWP::MediaTypes qw(guess_media_type);
$type = guess_media_type("/tmp/foo.gif");
```

```
=head1 DESCRIPTION
```

This module provides functions for handling media (also known as MIME) types and encodings. The mapping from file extensions to media types is defined by the F<media.types> file. If the F<~/.media.types> file exists it is used instead.

For backwards compatibility we will also look for F<~/.mime.types>.

The following functions are exported by default:

```
=over 4
```

```
=item guess_media_type( $filename )
```

```
=item guess_media_type( $uri )
```

```
=item guess_media_type( $filename_or_uri, $header_to_modify )
```

This function tries to guess media type and encoding for a file or a URI.

It returns the content type, which is a string like C<"text/html">.

In array context it also returns any content encodings applied (in the order used to encode the file).

You can pass a URI object reference, instead of the file name.

If the type can not be deduced from looking at the file name, then guess\_media\_type() will let the C<-T> Perl operator take a look.

If this works (and C<-T> returns a TRUE value) then we return

I<text/plain> as the type, otherwise we return

I<application/octet-stream> as the type.

The optional second argument should be a reference to a HTTP::Headers object or any object that implements the \$obj->header method in a similar way. When it is present the values of the 'Content-Type' and 'Content-Encoding' will be set for this header.

```
=item media_suffix( $type, ... )
```

This function will return all suffixes that can be used to denote the specified media type(s). Wildcard types can be used. In a scalar context it will return the first suffix found. Examples:

```
@suffixes = media_suffix('image/*', 'audio/basic');
$suffix = media_suffix('text/html');
```

=back

The following functions are only exported by explicit request:

=over

4

=item add\_type( \$type, @exts )

Associate a list of file extensions with the given media type.

Example:

```
add_type("x-world/x-vrml" => qw(wrl vrml));
```

=item add\_encoding( \$type, @ext )

Associate a list of file extensions with an encoding type.

Example:

```
add_encoding("x-gzip" => "gz");
```

=item read\_media\_types( @files )

Parse media types files and add the type mappings found there.

Example:

```
read_media_types("conf/mime.types");
```

=back

NAME

LWP::MediaTypes - guess media type for a file or a URL

SYNOPSIS

```
use LWP::MediaTypes qw(guess_media_type);
```

```
$type = guess_media_type("/tmp/foo.gif");
```

## DESCRIPTION

This module provides functions for handling media (also known as MIME) types and encodings. The mapping from file extensions to media types is defined by the `media.types` file. If the `~/media.types` file exists it is used instead. For backwards compatibility we will also look for `~/mime.types`.

The following functions are exported by default:

```
guess_media_type( $filename )
```

```
guess_media_type( $uri )
```

```
guess_media_type( $filename_or_uri, $header_to_modify )
```

This function tries to guess media type and encoding for a file or a URI. It returns the content type, which is a string like ``text/html'`. In array context it also returns any content encodings applied (in the order used to encode the file). You can pass a URI object reference, instead of the file name.

If the type can not be deduced from looking at the file name, then `guess_media_type()` will let the ``-T'` Perl operator take a look. If this works (and ``-T'` returns a TRUE value) then we return `*text/plain*` as the type, otherwise we return `*application/octet-stream*` as the type.

The optional second argument should be a reference to a `HTTP::Headers` object or any object that implements the `$obj->header` method in a similar way. When it is present the values of the `'Content-Type'` and `'Content-Encoding'` will be set for this header.

```
media_suffix( $type, ... )
```

This function will return all suffixes that can be used to denote the specified media type(s). Wildcard types can be used. In a scalar context it will return the first suffix found. Examples:

```
@suffixes = media_suffix('image/*', 'audio/basic');
```

```
$suffix = media_suffix('text/html');
```

The following functions are only exported by explicit request:

```
add_type( $type, @exts )
```

Associate a list of file extensions with the given media type.

Example:

```
add_type("x-world/x-vrml" => qw(wrl vrml));
```

add\_encoding( \$type, @ext )

Associate a list of file extensions with an encoding type. Example:

```
add_encoding("x-gzip" => "gz");
```

read\_media\_types( @files )

Parse media types files and add the type mappings found there.

Example:

```
read_media_types("conf/mime.types");
```

```
# This file maps Internet media types to unique file extension(s).  
# Although created for httpd, this file is used by many software systems  
# and has been placed in the public domain for unlimited redistribution.  
#  
# The table below contains both registered and (common) unregistered types.  
# A type that has no unique extension can be ignored -- they are listed  
# here to guide configurations toward known types and to make it easier to  
# identify "new" types. File extensions are also commonly used to indicate  
# content languages and encodings, so choose them carefully.  
#  
# Internet media types should be registered as described in RFC 4288.  
# The registry is at <http://www.iana.org/assignments/media-types/>.

Source Filters

Version 1.49

2013-04-01 rurban

Copyright (c) 1995-2011 Paul Marquess. All rights reserved.  
This program is free software; you can redistribute it and/or  
modify it under the same terms as Perl itself.

## DESCRIPTION

-----

This distribution consists of a number of Source Filters.

For more details see the pod documentation embedded in the .pm files.

If you intend using the Filter::Util::Call functionality, I would strongly recommend that you check out Damian Conway's excellent Filter::Simple module. Damian's module provides a much cleaner interface than Filter::Util::Call. Although it doesn't allow the fine control that Filter::Util::Call does, it should be adequate for the majority of applications. It's available at

<http://search.cpan.org/dist/Filter-Simple/>

## PREREQUISITES

-----

Before you can build the Source Filters you need to have the following installed on your system:

\* Perl 5.005 or better. 5.6.0 or better is recommended for Win32.

If your Perl is less than version 5.004\_55, the "order" test harness will be skipped.

## BUILDING THE MODULES

-----

Assuming you have met all the prerequisites, building the modules should be relatively straightforward.

The modules can now be built using this sequence of commands:

```
perl Makefile.PL  
make  
make test
```

The filters have been successfully built and tested on the following

systems (at least):

linux (gcc or clang)  
cygwin 1.7  
mingw strawberry 5.14  
SunOS 4.1.3 (Sun C compiler & gcc 2.7.2.3)  
Solaris 2.3 (Sun C Compiler)  
irix 5.3  
irix 6.x  
Windows XP (Visual C++ 6.0)

On Windows tr.exe and cpp.exe should be really the gnu/mingw tools in the path for the testsuite to pass successfully.

## INSTALLATION

-----

make install

## UPDATES

-----

The most recent version of  
the Filters is always available at

<http://www.cpan.org/modules/by-module/Filter>

Found in path(s):

\* /opt/cola/permits/1592955669\_1678946234.3589108/0/perl-Filter-1.49-3.el7-1.src.rpm-cosi-expand-archive-exgteBPt/Filter-1.49.tar.gz-cosi-expand-archive-YqVstY5H/Filter-1.49/README

No license file was found, but licenses were detected in source scan.

=head1 NAME

perlfiter - Source Filters

=head1 DESCRIPTION

This article is about a little-known feature of Perl called I<source filters>. Source filters alter the program text of a module before Perl sees it, much as a C preprocessor alters the source text of a C program before the compiler sees it. This article tells you more about what source filters are, how they work, and how to write your own.

The original purpose of source filters was to let you encrypt your program source to prevent casual piracy. This isn't all they can do, as you'll soon learn. But first, the basics.

## =head1 CONCEPTS

Before the Perl interpreter can execute a Perl script, it must first read it from a file into memory for parsing and compilation. If that script itself includes other scripts with a `C<use>` or `C<require>` statement, then each of those scripts will have to be read from their respective files as well.

Now think of each logical connection between the Perl parser and an individual file as a `I<source stream>`. A source stream is created when the Perl parser opens a file, it continues to exist as the source code is read into memory, and it is destroyed when Perl is finished parsing the file. If the parser encounters a `C<require>` or `C<use>` statement in a source stream, a new and distinct stream is created just for that file.

The diagram below represents a single source stream, with the flow of source from a Perl script file on the left into the Perl parser on the right. This is how Perl normally operates.

file -----> parser

There are two important points to remember:

=over 5

=item 1.

Although there can be any number of source streams in existence at any given time, only one will be active.

=item 2.

Every source stream is associated with only one file.

=back

A source filter is a special kind of Perl module that intercepts and modifies a source stream before it reaches the parser. A source filter changes our diagram like this:

file ----> filter ----> parser

If that doesn't make much sense, consider the analogy of a command pipeline. Say you have a shell script stored in the compressed file

I<trial.gz>. The simple pipeline command below runs the script without needing to create a temporary file to hold the uncompressed file.

```
gunzip -c trial.gz | sh
```

In this case, the data flow from the pipeline can be represented as follows:

```
trial.gz ----> gunzip ----> sh
```

With source filters, you can store the text of your script compressed and use a source filter to uncompress it for Perl's parser:

```
compressed      gunzip  
Perl program ---> source filter ---> parser
```

=head1 USING FILTERS

So how do you use a source filter in a Perl script? Above, I said that a source filter is just a special kind of module. Like all Perl modules, a source filter is invoked with a use statement.

Say you want to pass your Perl source through the C preprocessor before execution. As it

happens, the source filters distribution comes with a C preprocessor filter module called Filter::cpp.

Below is an example program, C<cpp\_test>, which makes use of this filter. Line numbers have been added to allow specific lines to be referenced easily.

```
1: use Filter::cpp;  
2: #define TRUE 1  
3: $a = TRUE;  
4: print "a = $a\n";
```

When you execute this script, Perl creates a source stream for the file. Before the parser processes any of the lines from the file, the source stream looks like this:

```
cpp_test -----> parser
```

Line 1, C<use Filter::cpp>, includes and installs the C<cpp> filter module. All source filters work this way. The use statement is compiled and executed at compile time, before any more of the file is read, and it attaches the cpp filter to the source stream behind the scenes. Now the data flow looks like this:

```
cpp_test ----> cpp filter ----> parser
```

As the parser reads the second and subsequent lines from the source stream, it feeds those lines through the C<cpp> source filter before processing them. The C<cpp> filter simply passes each line through the real C preprocessor. The output from the C preprocessor is then inserted back into the source stream by the filter.

```

      .-> cpp --.
      |      |
      |      |
      |      <-'
cpp_test ----> cpp filter ----> parser

```

The parser then sees the following code:

```

use Filter::cpp;
$a = 1;
print "a = $a\n";

```

Let's consider what happens when the filtered code includes another module with use:

```

1: use Filter::cpp;
2: #define TRUE 1
3: use Fred;
4: $a = TRUE;
5: print "a = $a\n";

```

The C<cpp> filter does not apply to the text of the Fred module, only to the text of the file that used it (C<cpp\_test>). Although the use statement on line 3 will pass through the cpp filter, the module that gets included (C<Fred>) will not. The source streams look like this after line 3 has been parsed and before line 4 is parsed:

```

cpp_test ---> cpp filter ---> parser (INACTIVE)

```

```

Fred.pm ----> parser

```

As you can see, a new stream has been created for reading the source from C<Fred.pm>. This stream will remain active until all of C<Fred.pm> has been parsed. The source stream for C<cpp\_test> will still exist, but is inactive. Once the parser has finished reading Fred.pm, the source stream associated with it will be destroyed. The source stream for C<cpp\_test> then becomes active again and the parser reads line 4 and subsequent lines from C<cpp\_test>.

You can use more than one source filter on a single file. Similarly, you can reuse the same filter in as many files as you like.

For example, if you have a uuencoded and compressed source file, it is possible to stack a uuencode filter and an uncompression filter like this:

```
use Filter::uuencode; use Filter::uncompress;
M'XL("H<US4"V9I;F%L')Q;>7/;1I;_>_I3=&E=%:F*I"T?22Q/
M6]9*<IQCO*XFT"0[PL%%'Y+IG?WN^ZYN-$J.[.JE$,20/?K=_[>
...
```

Once the first line has been processed, the flow will look like this:

```
file ---> uuencode ---> uncompress ---> parser
      filter      filter
```

Data flows through filters in the same order they appear in the source file. The uuencode filter appeared before the uncompress filter, so the source file will be uuencoded before it's uncompressed.

## =head1 WRITING A SOURCE FILTER

There are three ways to write your own source filter. You can write it in C, use an external program as a filter, or write the filter in Perl. I won't cover the first two in any great detail, so I'll get them out of the way first. Writing the filter in Perl is most convenient, so I'll devote the most space to it.

## =head1 WRITING A SOURCE FILTER IN C

The first of the three available techniques is to write the filter completely in C. The external module you create interfaces directly with the source filter hooks provided by Perl.

The advantage of this technique is that you have complete control over the implementation of your filter. The big disadvantage is the increased complexity required to write the filter - not only do you need to understand the source filter hooks, but you also need a reasonable knowledge of Perl guts. One of the few times it is worth going to this trouble is when writing a source scrambler. The C<decrypt> filter (which unscrambles the source before Perl parses it) included with the source filter distribution is an example of a C source filter (see Decryption Filters, below).

=over 5

=item B<Decryption Filters>

All decryption filters work on the principle of "security through obscurity." Regardless of how well you write a decryption filter and how strong your encryption algorithm is, anyone determined enough can retrieve the original source code. The reason is quite simple - once the decryption filter has decrypted the source back to its original form, fragments of it will be stored in the computer's memory as Perl parses it. The source might only be in memory for a short period of time, but anyone possessing a debugger, skill, and lots of patience can eventually reconstruct your program.

That said, there are a number of steps that can be taken to make life difficult for the potential cracker. The most important: Write your decryption filter in C and statically link the decryption module into the Perl binary. For further tips to make life difficult for the potential cracker, see the file I<decrypt.pm> in the source filters distribution.

=back

=head1 CREATING A SOURCE FILTER AS A SEPARATE EXECUTABLE

An alternative to writing the filter in C is to create a separate executable in the language of your choice. The separate executable reads from standard input, does whatever processing is necessary, and writes the filtered data to standard output. C<Filter::cpp> is an example of a source filter implemented as a separate executable - the executable is the C preprocessor bundled with your C compiler.

The source filter distribution includes two modules that simplify this task: C<Filter::exec> and C<Filter::sh>. Both allow you to run any external executable. Both use a coprocess to control the flow of data into and out of the external executable. (For details on coprocesses, see Stephens, W.R., "Advanced Programming in the UNIX Environment." Addison-Wesley, ISBN 0-210-56317-7, pages 441-445.) The difference between them is that C<Filter::exec> spawns the external command directly, while C<Filter::sh> spawns a shell to execute the external command. (Unix uses the Bourne shell; NT uses the cmd shell.) Spawning a shell allows you to make use of the shell metacharacters and redirection facilities.

Here is an example script that uses C<Filter::sh>:

```
use Filter::sh 'tr XYZ PQR';
```

```
$a = 1;
print "XYZ a = $a\n";
```

The output you'll get when the script is executed:

```
PQR a = 1
```

Writing a source filter as a separate executable works fine, but a small performance penalty is incurred. For example, if you execute the small example above, a separate subprocess will be created to run the Unix C<tr> command. Each use of the filter requires its own subprocess. If creating subprocesses is expensive on your system, you might want to consider one of the other options for creating source filters.

#### =head1 WRITING A SOURCE FILTER IN PERL

The easiest and most portable option available for creating your own source filter is to write it completely in Perl. To distinguish this from the previous two techniques, I'll call it a Perl source filter.

To help understand how to write a Perl source filter we need an example to study. Here is a complete source filter that performs rot13 decoding. (Rot13 is a very simple encryption scheme used in Usenet postings to hide the contents of offensive posts. It moves every letter forward thirteen places, so that A becomes N, B becomes O, and Z becomes M.)

```
package Rot13;

use Filter::Util::Call;

sub import {
    my ($type) = @_;
    my ($ref) = [];
    filter_add(bless
    $ref);
}

sub filter {
    my ($self) = @_;
    my ($status);

    tr/n-za-mN-ZA-M/a-zA-Z/
    if ($status = filter_read()) > 0;
    $status;
}
```

1;

All Perl source filters are implemented as Perl classes and have the same basic structure as the example above.

First, we include the `C<Filter::Util::Call>` module, which exports a number of functions into your filter's namespace. The filter shown above uses two of these functions, `C<filter_add()>` and `C<filter_read()>`.

Next, we create the filter object and associate it with the source stream by defining the `C<import>` function. If you know Perl well enough, you know that `C<import>` is called automatically every time a module is included with a use statement. This makes `C<import>` the ideal place to both create and install a filter object.

In the example filter, the object (`C<$ref>`) is blessed just like any other Perl object. Our example uses an anonymous array, but this isn't a requirement. Because this example doesn't need to store any context information, we could have used a scalar or hash reference just as well. The next section demonstrates context data.

The association between the filter object and the source stream is made with the `C<filter_add()>` function. This takes a filter object as a parameter (`C<$ref>` in this case) and installs it in the source stream.

Finally, there is the code that actually does the filtering. For this type of Perl source filter, all the filtering is done in a method called `C<filter()>`. (It is also possible to write a Perl source filter using a closure. See the `C<Filter::Util::Call>` manual page for more details.) It's called every time the Perl parser needs another line of source to process. The `C<filter()>` method, in turn, reads lines from the source stream using the `C<filter_read()>` function.

If a line was available from the source stream, `C<filter_read()>` returns a status value greater than zero and appends the line to `C<$_>`. A status value of zero indicates end-of-file, less than zero means an error. The filter function itself is expected to return its status in the same way, and put the filtered line it wants written to the source stream in `C<$_>`. The use of `C<$_>` accounts for the brevity of most Perl source filters.

In order to make use of the rot13 filter we need some way of encoding the source file in rot13 format. The script below, `C<mkrot13>`, does just that.

```
die "usage mkrot13 filename\n" unless @ARGV;
my $in = $ARGV[0];
my $out = "$in.tmp";
open(IN, "<$in") or die "Cannot open file $in: $!\n";
open(OUT, ">$out") or die "Cannot open file $out: $!\n";
```

```
print OUT "use Rot13;\n";
while (<IN>) {
    tr/a-zA-Z/n-za-mN-ZA-M/;
    print OUT;
}
```

```
close IN;
close OUT;
unlink $in;
rename $out, $in;
```

If we encrypt this with C<mkrot13>:

```
print " hello fred \n";
```

the result will be this:

```
use Rot13;
cevag "uryyb serq\a";
```

Running it produces this output:

```
hello
fred
```

=head1 USING CONTEXT: THE DEBUG FILTER

The rot13 example was a trivial example. Here's another demonstration that shows off a few more features.

Say you wanted to include a lot of debugging code in your Perl script during development, but you didn't want it available in the released product. Source filters offer a solution. In order to keep the example simple, let's say you wanted the debugging output to be controlled by an environment variable, C<DEBUG>. Debugging code is enabled if the variable exists, otherwise it is disabled.

Two special marker lines will bracket debugging code, like this:

```
## DEBUG_BEGIN
if ($year > 1999) {
```

```

    warn "Debug: millennium bug in year $year\n";
}
## DEBUG_END

```

The filter ensures that Perl parses the code between the <DEBUG\_BEGIN> and <DEBUG\_END> markers only when the <DEBUG> environment variable exists. That means that when <DEBUG> does exist, the code above should be passed through the filter unchanged. The marker lines can also be passed through as-is, because the Perl parser will see them as comment lines. When <DEBUG> isn't set, we need a way to disable the debug code. A simple way to achieve that is to convert the lines between the two markers into comments:

```

## DEBUG_BEGIN
#if ($year > 1999) {
#   warn "Debug: millennium bug in year $year\n";
#}
## DEBUG_END

```

Here is the complete Debug filter:

```

package Debug;

use strict;
use warnings;
use Filter::Util::Call;

use constant TRUE => 1;
use constant FALSE => 0;

sub import {
    my ($type) = @_ ;
    my (%context) = (
        Enabled => defined $ENV{DEBUG},
        InTraceBlock => FALSE,
        Filename => (caller)[1],
        LineNo => 0,
        LastBegin => 0,
    );
    filter_add(bless \%context);
}

sub Die {
    my ($self) = shift;
    my ($message) = shift;
    my ($line_no) = shift || $self->{LastBegin};
    die "$message at $self->{Filename} line $line_no.\n"
}

```

```

}

sub filter {
    my ($self) = @_;
    my ($status);
    $status = filter_read();
    ++ $self->{LineNo};

    # deal with EOF/error first
    if ($status <= 0) {
        $self->Die("DEBUG_BEGIN has no DEBUG_END")
        if $self->{InTraceBlock};
        return $status;
    }

    if ($self->{InTraceBlock}) {
        if (/^\s*##\s*DEBUG_BEGIN/) {
            $self->Die("Nested DEBUG_BEGIN", $self->{LineNo})
        } elsif (/^\s*##\s*DEBUG_END/) {
            $self->{InTraceBlock} = FALSE;
        }

        # comment out the debug lines when the filter is disabled
        s/^\s*##\s*DEBUG_BEGIN/ if ! $self->{Enabled};
    } elsif (/^\s*##\s*DEBUG_BEGIN/) {
        $self->{InTraceBlock} = TRUE;
        $self->{LastBegin} = $self->{LineNo};
    } elsif (/^\s*##\s*DEBUG_END/) {
        $self->Die("DEBUG_END has no DEBUG_BEGIN", $self->{LineNo});
    }
    return $status;
}

1;

```

The big difference between

this filter and the previous example is the use of context data in the filter object. The filter object is based on a hash reference, and is used to keep various pieces of context information between calls to the filter function. All but two of the hash fields are used for error reporting. The first of those two, Enabled, is used by the filter to determine whether the debugging code should be given to the Perl parser. The second, InTraceBlock, is true when the filter has encountered a C<DEBUG\_BEGIN> line, but has not yet encountered the following C<DEBUG\_END> line.

If you ignore all the error checking that most of the code does, the essence of the filter is as follows:

```

sub filter {
    my ($self) = @_;
    my ($status);
    $status = filter_read();

    # deal with EOF/error first
    return $status if $status <= 0;
    if ($self->{InTraceBlock}) {
        if (/^\s*##\s*DEBUG_END/) {
            $self->{InTraceBlock} = FALSE
        }

        # comment
        out debug lines when the filter is disabled
        s/^\#/ if ! $self->{Enabled};
    } elsif ( /^\s*##\s*DEBUG_BEGIN/ ) {
        $self->{InTraceBlock} = TRUE;
    }
    return $status;
}

```

Be warned: just as the C-preprocessor doesn't know C, the Debug filter doesn't know Perl. It can be fooled quite easily:

```

print <<EOM;
##DEBUG_BEGIN
EOM

```

Such things aside, you can see that a lot can be achieved with a modest amount of code.

=head1 CONCLUSION

You now have better understanding of what a source filter is, and you might even have a possible use for them. If you feel like playing with source filters but need a bit of inspiration, here are some extra features you could add to the Debug filter.

First, an easy one. Rather than having debugging code that is all-or-nothing, it would be much more useful to be able to control which specific blocks of debugging code get included. Try extending the syntax for debug blocks to allow each to be identified. The contents of the C<DEBUG> environment variable can then be used to control which blocks get included.

Once you can identify individual blocks, try allowing them to be

nested. That isn't difficult either.

Here is an interesting idea that doesn't involve the Debug filter. Currently Perl subroutines have fairly limited support for formal parameter lists. You can specify the number of parameters and their type, but you still have to manually take them out of the C<@\_> array yourself. Write a source filter that allows you to have a named parameter list. Such a filter would turn this:

```
sub MySub ($first, $second, @rest) { ... }
```

into this:

```
sub MySub($$@) {  
  my ($first) = shift;  
  my ($second) = shift;  
  my (@rest) = @_;  
  ...  
}
```

Finally, if you feel like a real challenge, have a go at writing a full-blown Perl macro preprocessor as a source filter. Borrow the useful features from the C preprocessor and any other macro processors you know. The tricky bit will be choosing how much knowledge of Perl's syntax you want your filter to have.

=head1 THINGS TO LOOK OUT FOR

=over 5

=item Some Filters Clobber the C<DATA> Handle

Some source filters use the C<DATA> handle to read the calling program. When using these source filters you cannot rely on this handle, nor expect any particular kind of behavior when operating on it. Filters based on Filter::Util::Call (and therefore Filter::Simple) do not alter the C<DATA> filehandle.

=back

=head1 REQUIREMENTS

The Source Filters distribution is available on CPAN, in

CPAN/modules/by-module/Filter

Starting from Perl 5.8 Filter::Util::Call (the core part of the

Source Filters distribution) is part of the standard Perl distribution.

Also included is a friendlier interface called Filter::Simple, by

Damian Conway.

=head1 NAME

URI::Escape - Percent-encode and percent-decode unsafe characters

=head1 SYNOPSIS

```
use URI::Escape;
$safe = uri_escape("10% is enough\n");
$verysafe = uri_escape("foo", "\0-\377");
$str = uri_unescape($safe);
```

=head1 DESCRIPTION

This module provides functions to percent-encode and percent-decode URI strings as defined by RFC 3986. Percent-encoding URI's is informally called "URI escaping". This is the terminology used by this module, which predates the formalization of the terms by the RFC by several years.

A URI consists of a restricted set of characters. The restricted set of characters consists of digits, letters, and a few graphic symbols chosen from those common to most of the character encodings and input facilities available to Internet users. They are made up of the "unreserved" and "reserved" character sets as defined in RFC 3986.

```
unreserved = ALPHA / DIGIT / "-" / "." / "_" / "~"
reserved  = ":" / "/" / "?" / "#" / "[" / "]" / "@"
           "!" / "$" / "&" / "'" / "(" / ")"
           / "*" / "+" / "," / ";" / "="
```

In addition, any byte (octet) can be represented in a URI by an escape sequence: a triplet consisting of the character "%" followed by two hexadecimal digits. A byte can also be represented directly by a character, using the US-ASCII character for that octet.

Some of the characters are I<reserved> for use as delimiters or as part of certain URI components. These must be escaped if they are to be treated as ordinary data. Read RFC 3986 for further details.

The functions provided (and exported by default) from this module are:

=over 4

=item uri\_escape( \$string )

=item uri\_escape( \$string, \$unsafe )

Replaces each unsafe character in the \$string with the corresponding escape sequence and returns the result. The \$string argument should be a string of bytes. The uri\_escape() function will croak if given a characters with

code above 255. Use `uri_escape_utf8()` if you know you have such chars or/and want chars in the 128 .. 255 range treated as UTF-8.

The `uri_escape()` function takes an optional second argument that overrides the set of characters that are to be escaped. The set is specified as a string that can be used in a regular expression character class (between [ ]). E.g.:

```
"\x00-\x1f\x7f-\xff"    # all control and hi-bit characters
"a-z"                  # all lower case characters
"^[A-Za-z]"           # everything not a letter
```

The default set of characters to be escaped is all those which are I<not> part of the C<unreserved> character class shown above as well as the reserved characters. I.e. the default is:

```
"^A-Za-z0-9\|\.~"
```

```
=item uri_escape_utf8( $string )
```

```
=item uri_escape_utf8( $string, $unsafe )
```

Works like `uri_escape()`, but will encode chars as UTF-8 before escaping them. This makes this function able to deal with characters with code above 255 in `$string`.

Note that chars in the 128 .. 255 range will be escaped differently by this function compared to what `uri_escape()` would. For chars in the 0 .. 127 range there is no difference.

Equivalent to:

```
utf8::encode($string);
my $uri = uri_escape($string);
```

Note: JavaScript has a function called `escape()` that produces the sequence "%uXXXX" for chars in the 256 .. 65535 range. This function has really nothing to do with URI escaping but some folks got confused since it "does the right thing" in the 0 .. 255 range. Because of this you sometimes see "URIs" with these kind of escapes. The JavaScript `encodeURIComponent()` function is similar to `uri_escape_utf8()`.

```
=item uri_unescape($string,...)
```

Returns a string with each %XX sequence replaced with the actual byte (octet).

This does the same as:

```
$string =~ s/%([0-9A-Fa-f]{2})/chr(hex($1))/eg;
```

but does not modify the string in-place as this RE would. Using the `uri_unescape()` function instead of the RE might make the code look cleaner and is a few characters less to type.

In a simple benchmark test I did, calling the function (instead of the inline RE above) if a few chars were unescaped was something like 40% slower, and something like 700% slower if none were. If you are going to unescape a lot of times it might be a good idea to inline the RE.

If the `uri_unescape()` function is passed multiple strings, then each one is returned unescaped.

=back

The module can also export the `C<%escapes>` hash, which contains the mapping from all 256 bytes to the corresponding escape codes. Lookup in this hash is faster than evaluating `C<sprintf("%%%02X", ord($byte))>` each time.

=head1 NAME

URI::Split - Parse and compose URI strings

## =head1 SYNOPSIS

```
use URI::Split qw(uri_split uri_join);
($scheme, $auth, $path, $query, $frag) = uri_split($uri);
$uri = uri_join($scheme, $auth, $path, $query, $frag);
```

## =head1 DESCRIPTION

Provides functions to parse and compose URI strings. The following functions are provided:

=over

=item (\$scheme, \$auth, \$path, \$query, \$frag) = uri\_split(\$uri)

Breaks up a URI string into its component parts. An C<undef> value is returned for those parts that are not present. The \$path part is always present (but can be the empty string) and is thus never returned as C<undef>.

No sensible value is returned if this function is called in a scalar context.

=item \$uri = uri\_join(\$scheme, \$auth, \$path, \$query, \$frag)

Puts together a URI string from its parts.

Missing parts are signaled by passing C<undef> for the corresponding argument.

Minimal escaping is applied to parts that contain reserved chars that would confuse a parser. For instance, any occurrence of '?' or '#' in \$path is always escaped, as it would otherwise be parsed back as a query or fragment.

=head1 NAME

URI::Heuristic - Expand URI using heuristics

=head1 SYNOPSIS

```
use URI::Heuristic qw(uf_uristr);
$u = uf_uristr("perl");      # http://www.perl.com
$u = uf_uristr("www.sol.no/sol"); # http://www.sol.no/sol
$u = uf_uristr("aas");       # http://www.aas.no
$u = uf_uristr("ftp.funet.fi"); # ftp://ftp.funet.fi
$u = uf_uristr("/etc/passwd"); # file:/etc/passwd
```

=head1 DESCRIPTION

This module provides functions that expand strings into real absolute URIs using some built-in heuristics. Strings that already represent absolute URIs (i.e. that start with a C<scheme:> part) are never modified and are returned unchanged. The main use of these functions is to allow abbreviated URIs similar to what many web browsers allow for URIs typed in by the user.

The following functions are provided:

=over 4

=item uf\_uristr(\$str)

Tries to make the argument string into a proper absolute URI string. The "uf\_" prefix stands for "User Friendly". Under MacOS, it assumes that any string with a common URL scheme (http, ftp, etc.) is a URL rather than a local path. So don't name your volumes after common URL schemes and expect uf\_uristr() to construct valid file: URL's on those volumes for you, because it won't.

=item uf\_uri(\$str)

Works the same way as uf\_uristr() but returns a C<URI> object.

=back

=head1 ENVIRONMENT

If the hostname portion of a URI does not contain any dots, then certain qualified guesses are made. These guesses are governed by the following environment variables:

=over 10

=item COUNTRY

The two-letter country code (ISO 3166) for your location. If the domain name of your host ends with two letters, then it is taken to be the default country. See also L<Locale::Country>.

=item HTTP\_ACCEPT\_LANGUAGE, LC\_ALL, LANG

If COUNTRY is not set, these standard environment variables are examined and country (not language) information possibly found in them is used as the default country.

=item URL\_GUESS\_PATTERN

Contains a space-separated list of URL patterns to try. The string "ACME" is for some reason used as a placeholder for the host name in the URL provided. Example:

```
URL_GUESS_PATTERN="www.ACME.no www.ACME.se www.ACME.com"
export URL_GUESS_PATTERN
```

Specifying URL\_GUESS\_PATTERN disables any guessing rules based on country. An empty URL\_GUESS\_PATTERN disables any guessing that involves host name lookups.

=head1 NAME

URI - Uniform Resource Identifiers (absolute and relative)

=head1 SYNOPSIS

```
$u1 = URI->new("http://www.perl.com");
$u2 = URI->new("foo", "http");
$u3 = $u2->abs($u1);
$u4 = $u3->clone;
$u5 = URI->new("HTTP://WWW.perl.com:80")->canonical;
```

```
$str = $u->as_string;
$str = "$u";
```

```
$scheme = $u->scheme;
$opaque = $u->opaque;
$path = $u->path;
$frag = $u->fragment;
```

```
$u->scheme("ftp");
$u->host("ftp.perl.com");
$u->path("cpan/");
```

=head1 DESCRIPTION

This module implements the C<URI> class. Objects of this class represent "Uniform Resource Identifier references" as specified in RFC 2396 (and updated by RFC 2732).

A Uniform Resource Identifier is a compact string of characters that identifies an abstract or physical resource. A Uniform Resource Identifier can be further classified as either a Uniform Resource Locator (URL) or a Uniform Resource Name (URN). The distinction between URL and URN

does not matter to the C<URI> class interface. A "URI-reference" is a URI that may have additional information attached in the form of a fragment identifier.

An absolute URI reference consists of three parts: a I<scheme>, a I<scheme-specific part> and a I<fragment> identifier. A subset of URI references share a common syntax for hierarchical namespaces. For these, the scheme-specific part is further broken down into I<authority>, I<path> and I<query> components. These URIs can also

take the form of relative URI references, where the scheme (and usually also the authority) component is missing, but implied by the context of the URI reference. The three forms of URI reference syntax are summarized as follows:

```
<scheme>:<scheme-specific-part>#<fragment>  
<scheme>://<authority><path>?<query>#<fragment>  
<path>?<query>#<fragment>
```

The components into which a URI reference can be divided depend on the `<scheme>`. The `C<URI>` class provides methods to get and set the individual components.

The methods available for a specific `C<URI>` object depend on the scheme.

## CONSTRUCTORS

The following methods construct new `C<URI>` objects:

over 4

```
URI->new( $str )
```

```
URI->new( $str, $scheme )
```

Constructs a new URI object. The string representation of a URI is given as argument, together with an optional scheme specification. Common URI wrappers like `""` and `<>`, as well as leading and trailing white space, are automatically removed from the `$str` argument before it is processed further.

The constructor determines the scheme, maps this to an appropriate URI subclass, constructs a new object of that class and returns it.

The `$scheme` argument is only used when `$str` is a relative URI. It can be either a simple string that denotes the scheme, a string containing an absolute URI reference, or an absolute `C<URI>` object. If no `$scheme` is specified for a relative URI `$str`, then `$str` is simply treated as a generic URI (no scheme-specific methods available).

The set of characters available for building URI references is restricted (see `L<URI::Escape>`). Characters outside this set are automatically escaped by the URI constructor.

```
URI->new_abs( $str, $base_uri )
```

Constructs a new absolute URI object. The \$str argument can denote a relative or absolute URI. If relative, then it is absolutized using \$base\_uri as base. The \$base\_uri must be an absolute URI.

```
=item $uri = URI::file->new( $filename )
```

```
=item $uri = URI::file->new( $filename, $os )
```

Constructs a new I<file> URI from a file name. See L<URI::file>.

```
=item $uri = URI::file->new_abs( $filename )
```

```
=item $uri = URI::file->new_abs( $filename, $os )
```

Constructs a new absolute I<file> URI from a file name. See L<URI::file>.

```
=item $uri = URI::file->cwd
```

Returns the current working directory as a I<file> URI. See L<URI::file>.

```
=item $uri->clone
```

Returns a copy of the \$uri.

```
=back
```

```
=head1 COMMON METHODS
```

The methods described in this section are available for all C<URI> objects.

Methods that give access to components of a URI always return the old value of the component. The value returned is C<undef> if the component was not present. There is generally a difference between a component that is empty (represented as C<"">) and a component that is missing (represented as C<undef>). If an accessor method is given an argument, it updates the corresponding component in addition to returning the old value of the component. Passing an undefined argument removes the component (if possible). The description of each accessor method indicates whether the component is passed as an escaped (percent-encoded) or an unescaped string. A component that can be further divided into sub-parts are usually passed escaped, as unescaping might change its semantics.

The common methods available for all URI are:

=over 4

=item \$uri->scheme

=item \$uri->scheme( \$new\_scheme )

Sets and returns the scheme part of the \$uri. If the \$uri is relative, then \$uri->scheme returns C<undef>. If called with an argument, it updates the scheme of \$uri, possibly changing the class of \$uri, and returns the old scheme value. The method croaks if the new scheme name is illegal; a scheme name must begin with a letter and must consist of only US-ASCII letters, numbers, and a few special marks: ".", "+", "-". This restriction effectively means that the scheme must be passed unescaped. Passing an undefined argument to the scheme method makes the URI relative (if possible).

Letter case does not matter for scheme names. The string returned by \$uri->scheme is always lowercase. If you want the scheme just as it was written in the URI in its original case, you can use the \$uri->\_scheme method instead.

=item \$uri->opaque

=item \$uri->opaque( \$new\_opaque )

Sets and returns the scheme-specific part of the \$uri (everything between the scheme and the fragment) as an escaped string.

=item \$uri->path

=item \$uri->path( \$new\_path )

Sets and returns the same value as \$uri->opaque unless the URI supports the generic syntax for hierarchical namespaces. In that case the generic method is overridden to set and return the part of the URI between the I<host name> and the I<fragment>.

=item \$uri->fragment

=item \$uri->fragment( \$new\_frag )

Returns the fragment identifier of a URI reference as an escaped string.

=item \$uri->as\_string

Returns a URI object to a plain ASCII string. URI objects are also converted to plain strings automatically by overloading. This means that \$uri objects can be used as plain strings in most Perl constructs.

=item \$uri->as\_iri

Returns a Unicode string representing the URI. Escaped UTF-8 sequences representing non-ASCII characters are turned into their corresponding Unicode code point.

=item \$uri->canonical

Returns a normalized version of the URI. The rules for normalization are scheme-dependent. They usually involve lowercasing the scheme and Internet host name components, removing the explicit port specification if it matches the default port, uppercasing all escape sequences, and unescaping octets that can be better represented as plain characters.

For efficiency reasons, if the \$uri is already in normalized form, then a reference to it is returned instead of a copy.

=item \$uri->eq( \$other\_uri )

=item URI::eq( \$first\_uri, \$other\_uri )

Tests whether two URI references are equal. URI references that normalize to the same string are considered equal. The method can also be used as a plain function which can also test two string arguments.

If you need to test whether two C<URI> object references denote the same object, use the '==' operator.

=item \$uri->abs( \$base\_uri )

Returns an absolute URI reference. If \$uri is already absolute, then a reference to it is simply returned. If the \$uri is relative, then a new absolute URI is constructed by combining the \$uri and the \$base\_uri, and returned.

=item \$uri->rel( \$base\_uri )

Returns a relative URI reference if it is possible to make one that denotes the same resource relative to \$base\_uri. If not, then \$uri is simply returned.

=item \$uri->secure

Returns a TRUE value if the URI is considered to point to a resource on a secure channel, such as an SSL or TLS encrypted one.

=back

=head1 GENERIC METHODS

The following methods are available to schemes that use the common/generic syntax for hierarchical namespaces. The descriptions of schemes below indicate which these are. Unknown schemes are assumed to support the generic syntax, and therefore the following methods:

=over 4

=item \$uri->authority

=item \$uri->authority( \$new\_authority )

Sets and returns the escaped authority component of the \$uri.

=item \$uri->path

=item \$uri->path( \$new\_path )

Sets and returns the escaped path component of the \$uri (the part between the host name and the query or fragment). The path can never be undefined, but it can be the empty string.

=item \$uri->path\_query

=item \$uri->path\_query( \$new\_path\_query )

Sets and returns the escaped path and query components as a single entity. The path and the query are separated by a "?" character, but the query can itself contain "?".

=item \$uri->path\_segments

=item \$uri->path\_segments( \$segment, ... )

Sets and returns the path. In a scalar context, it returns the same value as \$uri->path. In a list context, it returns the unescaped path segments that make up the path. Path segments that have parameters are returned as an anonymous array. The first element is the unescaped path segment proper; subsequent elements are escaped parameter strings. Such an anonymous array uses overloading so it can be treated as a string too, but this string does not include the parameters.

Note that absolute paths have the empty string as their first I<path\_segment>, i.e. the I<path> C</foo/bar> have 3 I<path\_segments>; "", "foo" and "bar".

=item \$uri->query

=item \$uri->query( \$new\_query )

Sets and returns the escaped query component of the \$uri.

=item \$uri->query\_form

=item \$uri->query\_form(  
\$key1 => \$val1, \$key2 => \$val2, ... )

=item \$uri->query\_form( \$key1 => \$val1, \$key2 => \$val2, ..., \$delim )

=item \$uri->query\_form( \@key\_value\_pairs )

=item \$uri->query\_form( \@key\_value\_pairs, \$delim )

=item \$uri->query\_form( \%hash )

=item \$uri->query\_form( \%hash, \$delim )

Sets and returns query components that use the I<application/x-www-form-urlencoded> format. Key/value pairs are separated by "&", and the key is separated from the value by a "=" character.

The form can be set either by passing separate key/value pairs, or via an array or hash reference. Passing an empty array or an empty hash removes the query component, whereas passing no arguments at all leaves the component unchanged. The order of keys is undefined if a hash reference is passed. The old value is always returned as a list of separate key/value pairs. Assigning this list to a hash is unwise as

the keys returned might repeat.

The values passed when setting the form can be plain strings  
or

references to arrays of strings. Passing an array of values has the  
same effect as passing the key repeatedly with one value at a time.

All the following statements have the same effect:

```
$uri->query_form(foo => 1, foo => 2);  
$uri->query_form(foo => [1, 2]);  
$uri->query_form([ foo => 1, foo => 2 ]);  
$uri->query_form([ foo => [1, 2] ]);  
$uri->query_form({ foo => [1, 2] });
```

The `$delim` parameter can be passed as ";" to force the key/value pairs  
to be delimited by ";" instead of "&" in the query string. This  
practice is often recommended for URLs embedded in HTML or XML  
documents as this avoids the trouble of escaping the "&" character.

You might also set the `$URI::DEFAULT_QUERY_FORM_DELIMITER` variable to  
";" for the same global effect.

The `C<URI::QueryParam>` module can be loaded to add further methods to  
manipulate the form of a URI. See `L<URI::QueryParam>` for details.

=item `$uri->query_keywords`

=item `$uri->query_keywords( $keywords, ... )`

=item `$uri->query_keywords(  
 \@keywords )`

Sets and returns query components that use the  
keywords separated by "+" format.

The keywords can be set either by passing separate keywords directly  
or by passing a reference to an array of keywords. Passing an empty  
array removes the query component, whereas passing no arguments at  
all leaves the component unchanged. The old value is always returned  
as a list of separate words.

=back

=head1 SERVER METHODS

For schemes where the `I<authority>` component denotes an Internet host,  
the following methods are available in addition to the generic  
methods.

=over 4

=item \$uri->userinfo

=item \$uri->userinfo( \$new\_userinfo )

Sets and returns the escaped userinfo part of the authority component.

For some schemes this is a user name and a password separated by a colon. This practice is not recommended. Embedding passwords in clear text (such as URI) has proven to be a security risk in almost every case where it has been used.

=item \$uri->host

=item \$uri->host(  
\$new\_host )

Sets and returns the unescaped hostname.

If the \$new\_host string ends with a colon and a number, then this number also sets the port.

For IPv6 addresses the brackets around the raw address is removed in the return value from \$uri->host. When setting the host attribute to an IPv6 address you can use a raw address or one enclosed in brackets. The address needs to be enclosed in brackets if you want to pass in a new port value as well.

=item \$uri->ihost

Returns the host in Unicode form. Any IDNA A-labels are turned into U-labels.

=item \$uri->port

=item \$uri->port( \$new\_port )

Sets and returns the port. The port is a simple integer that should be greater than 0.

If a port is not specified explicitly in the URI, then the URI scheme's default port is returned. If you don't want the default port substituted, then you can use the \$uri->\_port method instead.

=item \$uri->host\_port

=item \$uri->host\_port( \$new\_host\_port )

Sets and returns the host and port as a single unit.

The returned value includes a port, even if it matches the default port. The host part and the port part are separated by a colon: ":".

For IPv6 addresses the bracketing is preserved; thus `URI->new("http://[::1]/")->host_port` returns "[::1]:80". Contrast this with `$uri->host` which will remove the brackets.

=item `$uri->default_port`

Returns the default port of the URI scheme to which `$uri` belongs. For `I<http>` this is the number 80, for `I<ftp>` this is the number 21, etc. The default port for a scheme can not be changed.

=back

=head1 SCHEME-SPECIFIC SUPPORT

Scheme-specific support is provided for the following URI schemes. For `C<URI>` objects that do not belong to one of these, you can only use the common and generic methods.

=over 4

=item `B<data>`:

The `I<data>` URI scheme is specified in RFC 2397. It allows inclusion of small data items as "immediate" data, as if it had been included externally.

`C<URI>` objects belonging to the data scheme support the common methods and

two new methods to access their scheme-specific components: `$uri->media_type` and `$uri->data`. See `L<URI::data>` for details.

=item `B<file>`:

An old specification of the `I<file>` URI scheme is found in RFC 1738. A new RFC 2396 based specification is not available yet, but file URI references are in common use.

`C<URI>` objects belonging to the file scheme support the common and generic methods. In addition, they provide two methods for mapping file URIs back to local file names; `$uri->file` and `$uri->dir`. See `L<URI::file>` for details.

=item B<ftp>:

An old specification of the I<ftp> URI scheme is found in RFC 1738. A new RFC 2396 based specification is not available yet, but ftp URI references are in common use.

C<URI> objects belonging to the ftp scheme support the common, generic and server methods. In addition, they provide two methods for accessing the userinfo sub-components: \$uri->user and \$uri->password.

=item B<gopher>:

The I<gopher> URI scheme is specified in <draft-murali-url-gopher-1996-12-04> and will hopefully be available as a RFC 2396 based specification.

C<URI> objects belonging to the gopher scheme support the common, generic and server methods. In addition, they support some methods for accessing gopher-specific path components: \$uri->gopher\_type, \$uri->selector, \$uri->search, \$uri->string.

=item B<http>:

The I<http> URI scheme is specified in RFC 2616. The scheme is used to reference resources hosted by HTTP servers.

C<URI> objects belonging to the http scheme support the common, generic and server methods.

=item B<https>:

The I<https> URI scheme is a Netscape invention which is commonly implemented. The scheme is used to reference HTTP servers through SSL connections. Its syntax is the same as http, but the default port is different.

=item B<ldap>:

The I<ldap> URI scheme is specified in RFC 2255. LDAP is the Lightweight Directory Access Protocol. An ldap URI describes an LDAP search operation to perform to retrieve information from an LDAP directory.

C<URI> objects belonging to the ldap scheme support the common, generic and server methods as well as ldap-specific methods: \$uri->dn,

`$uri->attributes`, `$uri->scope`, `$uri->filter`, `$uri->extensions`. See [L<URI::ldap>](#) for details.

=item B<ldap>:

Like the [I<ldap>](#) URI scheme, but uses a UNIX domain socket. The server methods are not supported, and the local socket path is available as `$uri->un_path`. The [I<ldap>](#) scheme is used by the OpenLDAP package. There is no real specification for it, but it is mentioned in various OpenLDAP manual pages.

=item B<ldaps>:

Like the [I<ldap>](#) URI scheme, but uses an SSL connection. This scheme is deprecated, as the preferred way is to use the [I<start\\_tls>](#) mechanism.

=item B<mailto>:

The [I<mailto>](#) URI scheme is specified in RFC 2368. The scheme was originally used to designate the Internet mailing address of an individual or service. It has (in RFC 2368) been extended to allow setting of other mail header fields and the message body.

[C<URI>](#) objects belonging to the [mailto](#) scheme support the common methods and the generic query methods. In addition, they support the following [mailto](#)-specific methods: `$uri->to`, `$uri->headers`.

Note that the "foo@example.com" part of a [mailto](#) is [I<not>](#) the [C<userinfo>](#) and [C<host>](#) but instead the [C<path>](#). This allows a [mailto](#) URI to contain multiple comma separated email addresses.

=item B<mms>:

The [I<mms>](#) URL specification can be found at [L<http://sdp.ppona.com/>](http://sdp.ppona.com/). [C<URI>](#) objects belonging to the [mms](#) scheme support the common, generic, and server methods, with the exception of `userinfo` and query-related sub-components.

=item B<news>:

The [I<news>](#), [I<nntp>](#) and [I<snews>](#) URI schemes are specified in [<draft-gilman-news-url-01>](#) and will hopefully be available as an RFC 2396 based specification soon.

[C<URI>](#) objects belonging to the [news](#) scheme support the common, generic and server methods. In addition, they provide some methods to

access the path: \$uri->group and \$uri->message.

=item

B<nntp>:

See I<news> scheme.

=item B<pop>:

The I<pop> URI scheme is specified in RFC 2384. The scheme is used to reference a POP3 mailbox.

C<URI> objects belonging to the pop scheme support the common, generic and server methods. In addition, they provide two methods to access the userinfo components: \$uri->user and \$uri->auth

=item B<rlogin>:

An old specification of the I<rlogin> URI scheme is found in RFC 1738. C<URI> objects belonging to the rlogin scheme support the common, generic and server methods.

=item B<rtsp>:

The I<rtsp> URL specification can be found in section 3.2 of RFC 2326. C<URI> objects belonging to the rtsp scheme support the common, generic, and server methods, with the exception of userinfo and query-related sub-components.

=item B<rtspu>:

The I<rtspu> URI scheme is used to talk to RTSP servers over UDP instead of TCP. The syntax is the same as rtsp.

=item B<rsync>:

Information about rsync is available from L<<http://rsync.samba.org/>>.

C<URI>

objects belonging to the rsync scheme support the common, generic and server methods. In addition, they provide methods to access the userinfo sub-components: \$uri->user and \$uri->password.

=item B<sip>:

The I<sip> URI specification is described in sections 19.1 and 25 of RFC 3261. C<URI> objects belonging to the sip scheme support the common, generic, and server methods with the exception of path related sub-components. In addition, they provide two methods to get and set

I<sip> parameters: \$uri->params\_form and \$uri->params.

=item B<sips>:

See I<sip> scheme. Its syntax is the same as sip, but the default port is different.

=item B<snews>:

See I<news> scheme. Its syntax is the same as news, but the default port is different.

=item B<telnet>:

An old specification of the I<telnet> URI scheme is found in RFC 1738. C<URI> objects belonging to the telnet scheme support the common, generic and server methods.

=item B<tn3270>:

These URIs are used like I<telnet> URIs but for connections to IBM mainframes. C<URI> objects belonging to the tn3270 scheme support the common, generic and server methods.

=item B<ssh>:

Information about ssh is available at L<<http://www.openssh.com/>>. C<URI> objects belonging to the ssh scheme support the common, generic and server methods. In addition, they provide methods to access the userinfo sub-components: \$uri->user and \$uri->password.

=item B<urn>:

The syntax of Uniform Resource Names is specified in RFC 2141. C<URI> objects belonging to the urn scheme provide the common methods, and also the methods \$uri->nid and \$uri->nss, which return the Namespace Identifier and the Namespace-Specific String respectively.

The Namespace Identifier basically works like the Scheme identifier of URIs, and further divides the URN namespace. Namespace Identifier assignments are maintained at L<<http://www.iana.org/assignments/urn-namespaces>>.

Letter case is not significant for the Namespace Identifier. It is always returned in

lower case by the \$uri->nid method. The \$uri->\_nid method can be used if you want it in its original case.

=item B<urn>:B<isbn>:

The C<urn:isbn:> namespace contains International Standard Book Numbers (ISBNs) and is described in RFC 3187. A C<URI> object belonging to this namespace has the following extra methods (if the Business::ISBN module is available): \$uri->isbn, \$uri->isbn\_publisher\_code, \$uri->isbn\_group\_code (formerly isbn\_country\_code, which is still supported by issues a deprecation warning), \$uri->isbn\_as\_ean.

=item B<urn>:B<oid>:

The C<urn:oid:> namespace contains Object Identifiers (OIDs) and is described in RFC 3061. An object identifier consists of sequences of digits separated by dots. A C<URI> object belonging to this namespace has an additional method called \$uri->oid that can be used to get/set the oid value. In a list context, oid numbers are returned as separate elements.

=back

=head1 CONFIGURATION VARIABLES

The following configuration variables influence how the class and its methods behave:

=over 4

=item \$URI::ABS\_ALLOW\_RELATIVE\_SCHEME

Some older parsers used to allow the scheme name to be present in the relative URL if it was the same as the base URL scheme. RFC 2396 says that this should be avoided, but you can enable this old behaviour by setting the \$URI::ABS\_ALLOW\_RELATIVE\_SCHEME variable to a TRUE value. The difference is demonstrated by the following examples:

```
URI->new("http:foo")->abs("http://host/a/b")  
==> "http:foo"
```

```
local $URI::ABS_ALLOW_RELATIVE_SCHEME = 1;  
URI->new("http:foo")->abs("http://host/a/b")  
==> "http://host/a/foo"
```

=item \$URI::ABS\_REMOTE\_LEADING\_DOTS

You can also have the abs() method ignore excess ".." segments in the relative URI by setting \$URI::ABS\_REMOTE\_LEADING\_DOTS

to a TRUE value. The difference is demonstrated by the following examples:

```
URI->new(".././../foo")->abs("http://host/a/b")  
==> "http://host/././../foo"
```

```
local $URI::ABS_REMOTE_LEADING_DOTS = 1;  
URI->new(".././../foo")->abs("http://host/a/b")  
==> "http://host/foo"
```

```
=item $URI::DEFAULT_QUERY_FORM_DELIMITER
```

This value can be set to ";" to have the query form C<key=value> pairs delimited by ";" instead of "&" which is the default.

```
=back
```

```
=head1 BUGS
```

There are some things that are not quite right:

```
=over
```

```
=item *
```

Using regexp variables like \$1 directly as arguments to the URI accessor methods does not work too well with current perl implementations. I would argue that this is actually a bug in perl. The workaround is to quote them. Example:

```
/(...)/ || die;  
$u->query("$1");
```

```
=item *
```

The escaping (percent encoding) of chars in the 128 .. 255 range passed to the URI constructor or when setting URI parts using the accessor methods depend on the state of the internal UTF8 flag (see utf8::is\_utf8) of the string passed. If the UTF8 flag is set the UTF-8 encoded version of the character is percent encoded. If the UTF8 flag isn't set the Latin-1 version (byte) of the character is percent encoded. This basically exposes the internal encoding of Perl strings.

```
=back
```

```
=head1 PARSING URIs WITH REGEXP
```

As an alternative to this module, the following (official) regular expression can be used to decode a URI:

```
my($scheme, $authority, $path, $query, $fragment) =  
$uri =~ m(?:([^\?#]+):)?(?://(?:[^\?#]*))?(?:\?([^\?#]*))?(?:#(?:.*))?;
```

The C<URI::Split> module provides the function `uri_split()` as a readable alternative.

No license file was found, but licenses were detected in source scan.

This package contains the URI.pm module with friends. The module implements the URI class. Objects of this class represent Uniform Resource Identifier references as specified in RFC 2396 and updated by RFC 2732.

URI objects can be used to access and manipulate the various components that make up these strings. There are also methods to combine URIs in various ways.

Some tests require an Internet connection to work and are skipped if one is not active.

You need perl-5.8.1 or better to install this package. You should also have the MIME::Base64 module installed. Installation is otherwise as usual:

```
perl Makefile.PL
make
make test
make install
```

Questions about how to use this library should be directed to the comp.lang.perl.modules USENET Newsgroup. Bug reports and suggestions for improvements can be sent to the <libwww@perl.org> mailing list.

=head1 NAME

URI::file - URI that maps to local file names

=head1 SYNOPSIS

use URI::file;

```
$u1 = URI->new("file:/foo/bar");
```

```
$u2 = URI->new("foo/bar", "file");
```

```
$u3 = URI::file->new($path);
```

```
$u4 = URI::file->new("c:\\windows\\", "win32");
```

```
$u1->file;
```

```
$u1->file("mac");
```

=head1 DESCRIPTION

The C<URI::file> class supports C<URI> objects belonging to the I<file> URI scheme. This scheme allows us to map the conventional file names found on various computer systems to the URI name space. An old specification of the I<file> URI scheme is found in RFC 1738. Some older background information is also in RFC 1630. There are no newer specifications as far as I know.

If you simply want to construct I<file> URI objects from URI strings, use the normal C<URI> constructor. If you want to construct I<file> URI objects from the actual file names used by various systems, then

use one of the following C<URI::file> constructors:

=over  
4

=item \$u = URI::file->new( \$filename, [\$os] )

Maps a file name to the I<file> URI name space, creates a URI object and returns it. The \$filename is interpreted as belonging to the indicated operating system (\$os), which defaults to the value of the \$^O variable. The \$filename can be either absolute or relative, and the corresponding type of URI object for \$os is returned.

=item \$u = URI::file->new\_abs( \$filename, [\$os] )

Same as URI::file->new, but makes sure that the URI returned represents an absolute file name. If the \$filename argument is relative, then the name is resolved relative to the current directory, i.e. this constructor is really the same as:

```
URI::file->new($filename)->abs(URI::file->cwd);
```

=item \$u = URI::file->cwd

Returns a I<file> URI that represents the current working directory. See L<Cwd>.

=back

The following methods are supported for I<file> URI (in addition to the common and generic methods described in L<URI>):

=over 4

=item \$u->file(  
[\$os] )

Returns a file name. It maps from the URI name space to the file name space of the indicated operating system.

It might return C<undef> if the name can not be represented in the indicated file system.

=item \$u->dir( [\$os] )

Some systems use a different form for names of directories than for plain files. Use this method if you know you want to use the name for a directory.

=back

The C<URI::file> module can be used to map generic file names to names suitable for the current system. As such, it can work as a nice replacement for the C<File::Spec> module. For instance, the following code translates the UNIX-style file name F<Foo/Bar.pm> to a name suitable for the local system:

```
$file = URI::file->new("Foo/Bar.pm", "unix")->file;
die "Can't map filename Foo/Bar.pm for $^O" unless defined $file;
open(FILE, $file) || die "Can't open '$file': $!";
# do something with FILE
```

=head1 MAPPING NOTES

Most computer systems today have hierarchically organized file systems.

#### Mapping

the names used in these systems to the generic URI syntax allows us to work with relative file URIs that behave as they should when resolved using the generic algorithm for URIs (specified in RFC 2396). Mapping a file name to the generic URI syntax involves mapping the path separator character to "/" and encoding any reserved characters that appear in the path segments of the file name. If path segments consisting of the strings "." or ".." have a different meaning than what is specified for generic URIs, then these must be encoded as well.

If the file system has device, volume or drive specifications as the root of the name space, then it makes sense to map them to the authority field of the generic URI syntax. This makes sure that relative URIs can not be resolved "above" them, i.e. generally how relative file names work in those systems.

Another common use of the authority field is to encode the host on which this file name is valid. The host name "localhost" is special and generally has the same meaning as a missing or empty authority field. This use is in conflict with using it as a device specification, but can often be resolved for device specifications having characters not legal in plain host names.

File name to URI mapping is normally not one-to-one. There are usually many URIs that map to any given file name. For instance, an authority of "localhost" maps the same as a URI with a missing or empty authority.

Example 1: The Mac classic (Mac OS 9 and earlier) used ":" as path separator,

but not in the same way as a generic URI. ":foo" was a relative name. "foo:bar" was an absolute name. Also, path segments could contain the "/" character as well as the literal "." or "..". So the mapping looks like this:

| Mac classic |      | URI               |
|-------------|------|-------------------|
| -----       |      | -----             |
| :foo:bar    | <==> | foo/bar           |
| :           | <==> | ./                |
| ::foo:bar   | <==> | ../foo/bar        |
| :::         | <==> | .././             |
| foo:bar     | <==> | file:/foo/bar     |
| foo:bar:    | <==> | file:/foo/bar/    |
| ..          | <==> | %2E%2E            |
| <undef>     | <==  | /                 |
| foo/        | <==  | file:/foo%2F      |
| ./foo.txt   | <==  | file:/.%2Ffoo.txt |

Note that if you want a relative URL, you *must* begin the path with a :. Any path that begins with [^:] is treated as absolute.

Example 2: The UNIX file system is easy to map, as it uses the same path separator as URIs, has a single root, and segments of "." and ".." have the same meaning. URIs that have the character "\0" or "/" as part of any path segment can not be turned into valid UNIX file names.

| UNIX     |      | URI                      |
|----------|------|--------------------------|
| -----    |      | -----                    |
| foo/bar  | <==> | foo/bar                  |
| /foo/bar | <==> | file:/foo/bar            |
| /foo/bar | <==  | file://localhost/foo/bar |
| file:    | ==>  | ./file:                  |
| <undef>  | <==  | file:/fo%00/bar          |
| /        | <==> | file:/                   |

=cut

RFC 1630

[...]

There is clearly a danger of confusion that a link made to a local file should be followed by someone on a different system, with unexpected and possibly harmful results. Therefore, the convention is that even a "file" URL is provided with a host part. This allows a client on another system to know that it cannot access the file system, or perhaps to use some other local mechanism to access the

file.

The special value "localhost" is used in the host field to indicate that the filename should really be used on whatever host one is. This for example allows links to be made to files which are distributed on many machines, or to "your unix local password file" subject of course to consistency across the users of the data.

A void host field is equivalent to "localhost".

## =head1 CONFIGURATION VARIABLES

The following configuration variables influence how the class and its methods behave:

=over

=item %URI::file::OS\_CLASS

This hash maps OS identifiers to implementation classes. You might want to add or modify this if you want to plug in your own file handler class. Normally the keys should match the \$^O values in use.

If there is no mapping then the "Unix" implementation is used.

=item \$URI::file::DEFAULT\_AUTHORITY

This determine what "authority" string to include in absolute file URIs. It defaults to "". If you prefer verbose URIs you might set it to be "localhost".

Setting this value to C<undef> force behaviour compatible to URI v1.31 and earlier. In this mode host names in UNC paths and drive letters are mapped to the authority component on Windows, while we produce authority-less URIs on Unix.

=back

=head1 NAME

URI::data - URI that contains immediate data

=head1 SYNOPSIS

use URI;

```
$u = URI->new("data:");
$u->media_type("image/gif");
$u->data(scalar(`cat camel.gif`));
print "$u\n";
open(XV, "|xv -") and print XV $u->data;
```

=head1 DESCRIPTION

The C<URI::data> class supports C<URI> objects belonging to the I<data> URI scheme. The I<data> URI scheme is specified in RFC 2397. It allows inclusion of small data items as "immediate" data, as if it had been included externally. Examples:

```
data:;Perl%20is%20good
```

```

AAgAAAClYyPqcu9AJyCjtIKc5w5xP14xgeO2tlY3nWcajmZZdeJcG
Kxrmimms1KMTa1Wg8UROx4MNUq1HrycMjHT9b6xKxaFLM6VRKzI+p
KS9XtXpcbdun6uWVxJXA8pNPkdkkxhc21LZHFOgD2KMoQXa2KMWI
JtnE2KizVUkYJVZZ1nczBxXIFopZBtoJ2diXGdNUymmJdFMAADs=
```

C<URI> objects belonging to the data scheme support the common methods (described in L<URI>) and the following two scheme-specific methods:

=over 4

```
=item $uri->media_type( [$new_media_type] )
```

Can be used to get or set the media type specified in the URI. If no media type is specified, then the default C<"text/plain;charset=US-ASCII"> is returned.

```
=item $uri->data( [$new_data] )
```

Can be used to get or set the data contained in the URI. The data is passed unescaped (in binary form). The decision about whether to base64 encode the data in the URI is taken automatically, based on the encoding that produces the shorter URI string.

```

=head1 NAME
```

URI::ldap - LDAP Uniform Resource Locators

```
=head1 SYNOPSIS
```

```
use URI;
```

```
$uri = URI->new("ldap:$uri_string");
```

```
$dn   = $uri->dn;
```

```
$filter = $uri->filter;
```

```
@attr = $uri->attributes;
```

```
$scope = $uri->scope;
```

```

%extn = $uri->extensions;

$uri = URI->new("ldap:"); # start empty
$uri->host("ldap.itd.umich.edu");
$uri->dn("o=University of Michigan,c=US");
$uri->attributes(qw(postalAddress));
$uri->scope('sub');
$uri->filter('(cn=Babs Jensen)');
print $uri->as_string,"\n";

```

#### =head1 DESCRIPTION

C<URI::ldap> provides an interface to parse an LDAP URI into its constituent parts and also to build a URI as described in RFC 2255.

#### =head1 METHODS

C<URI::ldap> supports all the generic and server methods defined by L<URI>, plus the following.

Each of the following methods can be used to set or get the value in the URI. The values are passed in unescaped form. None of these return undefined values, but elements without a default can be empty. If arguments are given, then a new value is set for the given part of the URI.

=over 4

=item \$uri->dn( [ \$new\_dn ] )

Sets or gets the I<Distinguished Name> part of the URI. The DN identifies the base object of the LDAP search.

=item \$uri->attributes( [ @new\_attr ] )

Sets or gets the list of attribute names which are returned by the search.

=item \$uri->scope( [ \$new\_scope ] )

Sets or gets the scope to be used by the search. The value can be one of C<"base">, C<"one"> or C<"sub">. If none is given in the URI then the return value defaults to C<"base">.

=item \$uri->\_scope( [ \$new\_scope ] )

Same as scope(), but does not default to anything.

```
=item $uri->filter( [$new_filter] )
```

Sets or gets the filter to be used by the search. If none is given in the

URI then the return value defaults to C<"(objectClass=\*)">.

```
=item $uri->_filter( [$new_filter] )
```

Same as filter(), but does not default to anything.

```
=item $uri->extensions( [$etype => $value,...] )
```

Sets or gets the extensions used for the search. The list passed should be in the form etype1 => value1, etype2 => value2,... This is also the form of list that is returned.

=head1 NAME
```

URI::\_punycode - encodes Unicode string in Punycode

```
=head1 SYNOPSIS
```

```
use URI::_punycode;
$punycode = encode_punycode($unicode);
$unicode = decode_punycode($punycode);
```

## =head1 DESCRIPTION

URI::\_punycode is a module to encode / decode Unicode strings into Punycode, an efficient encoding of Unicode for use with IDNA.

This module requires Perl 5.6.0 or over to handle UTF8 flagged Unicode strings.

## =head1 FUNCTIONS

This module exports following functions by default.

=over 4

=item encode\_punycode

```
$punycode = encode_punycode($unicode);
```

takes Unicode string (UTF8-flagged variable) and returns Punycode encoding for it.

=item decode\_punycode

```
$unicode = decode_punycode($punycode)
```

takes Punycode encoding and returns original Unicode string.

=back

These functions throw exceptions on failure. You can catch 'em via C<eval>.

## =head1 AUTHOR

Tatsuhiko Miyagawa E<mailto:miyagawa@bulknews.net> is the author of IDNA::Punycode v0.02 which was the basis for this module.

=head1 NAME

pod2text - Convert POD data to formatted ASCII text

=head1 SYNOPSIS

pod2text [B<-aclostu>] [B<--code>] [B<--errors>=I<style>] [B<-i> I<indent>]
S<[B<-q> I<quotes>]> [B<--nourls>] [B<--stderr>] S<[B<-w> I<width>]>
[I<input> [I<output> ...]]

pod2text B<-h>

=head1 DESCRIPTION

B<pod2text> is a front-end for Pod::Text and its subclasses. It uses them
to generate formatted ASCII text from POD source. It can optionally use
either termcap sequences or ANSI color escape sequences to format the text.

```

I<input> is the file to read for POD source (the POD can be embedded in code). If I<input> isn't given, it defaults to C<STDIN>. I<output>, if given, is the file to which to write the formatted output. If I<output> isn't given, the formatted output is written to C<STDOUT>. Several POD files can be processed in the same B<pod2text> invocation (saving module load and compile times) by providing multiple pairs of I<input> and I<output> files on the command line.

=head1 OPTIONS

=over 4

=item B<-a>, B<--alt>

Use an alternate output format that, among other things, uses a different heading style and marks C<=item> entries with a colon in the left margin.

=item B<--code>

Include any non-POD text from the input file in the output as well. Useful for viewing code documented with POD blocks with the POD rendered and the code left intact.

=item B<-c>, B<--color>

Format the output with ANSI color escape sequences. Using this option requires that Term::ANSIColor be installed on your system.

=item B<-i> I<indent>, B<--indent=>I<indent>

Set the number of spaces to indent regular text, and the default indentation for C<=over> blocks. Defaults to 4 spaces if this option isn't given.

=item B<-errors>=I<style>

Set the error handling style. C<die> says to throw an exception on any POD formatting error. C<stderr> says to report errors on standard error, but not to throw an exception. C<pod> says to include a POD ERRORS section in the resulting documentation summarizing the errors. C<none> ignores POD errors entirely, as much as possible.

The default is C<die>.

=item B<-h>, B<--help>

Print out usage information and exit.

=item B<-l>, B<--loose>

Print a blank line after a C<=head1> heading. Normally, no blank line is printed after C<=head1>, although one is still printed after C<=head2>, because this is the expected formatting for manual pages; if you're formatting arbitrary text documents, using this option is recommended.

=item B<-m> I<width>, B<--left-margin>=I<width>, B<--margin>=I<width>

The width of the left margin in spaces. Defaults to 0. This is the margin for all text, including headings, not the amount by which regular text is indented; for the latter, see B<-i> option.

=item B<--nourls>

Normally, LZ<><> formatting codes with a URL but anchor text are formatted to show both the anchor text and the URL. In other words:

```
L<foo|http://example.com/>
```

is formatted as:

```
foo <http://example.com/>
```

This

flag, if given, suppresses the URL when anchor text is given, so this example would be formatted as just C<foo>. This can produce less cluttered output in cases where the URLs are not particularly important.

=item B<-o>, B<--overstrike>

Format the output with overstrike printing. Bold text is rendered as character, backspace, character. Italics and file names are rendered as underscore, backspace, character. Many pagers, such as B<less>, know how to convert this to bold or underlined text.

=item B<-q> I<quotes>, B<--quotes>=I<quotes>

Sets the quote marks used to surround CE<lt>> text to I<quotes>. If I<quotes> is a single character, it is used as both the left and right quote; if I<quotes> is two characters, the first character is used as the left quote and the second as the right quoted; and if I<quotes> is four characters, the first two are used as the left quote and the second two as the right quote.

I<quotes> may also be set to the special value C<none>, in which

case no

quote marks are added around `CE<lt>>` text.

=item `B<-s>`, `B<--sentence>`

Assume each sentence ends with two spaces and try to preserve that spacing. Without this option, all consecutive whitespace in non-verbatim paragraphs is compressed into a single space.

=item `B<--stderr>`

By default, `B<pod2text>` dies if any errors are detected in the POD input. If `B<--stderr>` is given and no `B<--errors>` flag is present, errors are sent to standard error, but `B<pod2text>` does not abort. This is equivalent to `C<--errors=stderr>` and is supported for backward compatibility.

=item `B<-t>`, `B<--termcap>`

Try to determine the width of the screen and the bold and underline sequences for the terminal from termcap, and use that information in formatting the output. Output will be wrapped at two columns less than the width of your terminal device. Using this option requires that your system have a termcap file somewhere where `Term::Cap` can find it and requires that your system support termios.

With this option, the output of `B<pod2text>` will contain terminal control sequences for your current terminal type.

=item `B<-u>`, `B<--utf8>`

By default, `B<pod2text>` tries to use the same output encoding as its input encoding (to be backward-compatible with older versions). This option says to instead force the output encoding to UTF-8.

Be aware that, when using this option, the input encoding of your POD source must be properly declared unless it is US-ASCII or Latin-1. POD input without an `C<=encoding>` command will be assumed to be in Latin-1, and if it's actually in UTF-8, the output will be double-encoded. See `L<perlpod(1)>` for more information on the `C<=encoding>` command.

=item `B<-w>`, `B<--width=>I<width>`, `B<->I<width>`

The column at which to wrap text on the right-hand side. Defaults to 76, unless `B<-t>` is given, in which case it's two columns less than the width of your terminal device.

=back

## =head1 EXIT STATUS

As long as all documents processed result in some output, even if that output includes errata (a C<POD ERRORS> section generated with C<--errors=pod>), B<pod2text> will exit with status 0. If any of the documents being processed do not result in an output document, B<pod2text> will exit with status 1. If there are syntax errors in a POD document being processed and the error handling style is set to the default of C<die>, B<pod2text> will abort immediately with exit status 255.

## =head1 DIAGNOSTICS

If B<pod2text> fails with errors, see L<Pod::Text> and L<Pod::Simple> for information about what those errors might mean. Internally, it can also produce the following diagnostics:

=over 4

=item -c (--color) requires Term::ANSIColor be installed

(F) B<-c> or B<--color> were given, but Term::ANSIColor could not be loaded.

=item Unknown option: %s

(F) An unknown command line option was given.

=back

In addition, other L<Getopt::Long> error messages may result from invalid command-line options.

## =head1 ENVIRONMENT

=over 4

=item COLUMNS

If B<-t> is given, B<pod2text> will take the current width of your screen from this environment variable, if available. It overrides terminal width information in TERMCAP.

=item TERMCAP

If B<-t> is given, B<pod2text> will use the contents of this environment variable if available to determine the correct formatting sequences for your

current terminal device.

=head1 NAME

perlpodstyle - Perl POD style guide

=head1 DESCRIPTION

These are general guidelines for how to write POD documentation for Perl scripts and modules, based on general guidelines for writing good UNIX man pages. All of these guidelines are, of course, optional, but following them will make your documentation more consistent with other documentation on the system.

The name of the program being documented is conventionally written in bold (using `BE<lt>E<gt>`) wherever it occurs, as are all program options. Arguments should be written in italics (`IE<lt>E<gt>`). Function names are traditionally written in italics; if you write a function as `function()`, Pod::Man will take care of this for you. Literal code or commands should be in `CE<lt>E<gt>`. References to other man pages should be in the form `C<manpage(section)>` or `C<LE<lt>manpage(section)E<gt>>`, and Pod::Man will automatically format those appropriately.

The second form, with `LE<lt>E<gt>`, is used to request that a POD formatter make a link to the man page if possible. As an exception, one normally omits the section when referring to module documentation since it's not clear what section module documentation will be in; use `C<LE<lt>Module::NameE<gt>>` for module references instead.

References to other programs or functions are normally in the form of man page references so that cross-referencing tools can provide the user with links and the like. It's possible to overdo this, though, so be careful not to clutter your documentation with too much markup. References to other programs that are not given as man page references should be enclosed in

BE<lt>E<gt>.

The major headers should be set out using a C<=head1> directive, and are historically written in the rather startling ALL UPPER CASE format; this is not mandatory, but it's strongly recommended so that sections have consistent naming across different software packages. Minor headers may be included using C<=head2>, and are typically in mixed case.

The standard sections of a manual page are:

=over 4

=item NAME

Mandatory section; should be a comma-separated list of programs or functions documented by this POD page, such as:

foo, bar - programs to do something

Manual page indexers are often extremely picky about the format of this section, so don't put anything in it except this line. Every program or function documented by this POD page should be listed, separated by a comma and a space. For a Perl module, just give the module name. A single dash, and only a single dash, should separate the list of programs or functions from the description. Do not use any markup such as CE<lt>E<gt> or BE<lt>E<gt> anywhere in this line. Functions should not be qualified with C<(>) or the like. The description should ideally fit on a single line, even if a man program replaces the dash with a few tabs.

=item SYNOPSIS

A short usage summary for programs and functions.

This section is mandatory for section 3 pages. For Perl module documentation, it's usually convenient to have the contents of this section be a verbatim block showing some (brief) examples of typical ways the module is used.

=item DESCRIPTION

Extended description and discussion of the program or functions, or the body of the documentation for man pages that document something else. If particularly long, it's a good idea to break this up into subsections C<=head2> directives like:

=head2 Normal Usage

=head2 Advanced Features

## =head2 Writing Configuration Files

or whatever is appropriate for your documentation.

For a module, this is generally where the documentation of the interfaces provided by the module goes, usually in the form of a list with an C<=item> for each interface. Depending on how many interfaces there are, you may want to put that documentation in separate METHODS, FUNCTIONS, CLASS METHODS, or INSTANCE METHODS sections instead and save the DESCRIPTION section for an overview.

### =item OPTIONS

Detailed description of each of the command-line options taken by the program. This should be separate from the description for the use of parsers like L<Pod::Usage>. This is normally presented as a list, with each option as a separate C<=item>. The specific option string should be enclosed in BE<lt>E<gt>. Any values that the option takes should be enclosed in IE<lt>E<gt>. For example, the section for the option B<--section>=I<manext> would be introduced with:

=item B<--section>=I<manext>

Synonymous options (like both the short and long forms) are separated by a comma and a space on the same C<=item> line, or optionally listed as their own item with a reference to the canonical name. For example, since B<--section> can also be written as B<-s>, the above would be:

=item B<-s> I<manext>, B<--section>=I<manext>

Writing the short option first is recommended because it's easier to read. The long option is long enough to draw the eye to it anyway and the short option can otherwise get lost in visual noise.

### =item RETURN VALUE

What the program or function returns, if successful. This section can be omitted for programs whose precise exit codes aren't important, provided they return 0 on success and non-zero on failure as is standard. It should always be present for functions. For modules, it may be useful to summarize return values from the module interface here, or it may be more useful to discuss return values separately in the documentation of each function or method the module provides.

### =item ERRORS

Exceptions, error return codes, exit statuses, and errno settings.

Typically used for function or module documentation; program documentation uses `DIAGNOSTICS` instead. The general rule of thumb is that errors printed to `C<STDOUT>` or `C<STDERR>` and intended for the end user are documented in `DIAGNOSTICS` while errors passed internal to the calling program and intended for other programmers are documented in `ERRORS`. When documenting a function that sets `errno`, a full list of the possible `errno` values should be given here.

#### =item `DIAGNOSTICS`

All possible messages the program can print out and what they mean. You may wish to follow the same documentation style as the Perl documentation; see `perldiag(1)` for more details (and look at the POD source as well).

If applicable, please include details on what the user should do to correct the error; documenting an error as indicating "the input buffer is too small" without telling the user how to increase the size of the input buffer (or at least telling them that it isn't possible) aren't very useful.

#### =item `EXAMPLES`

Give some example uses of the program or function. Don't skimp; users often find this the most useful part of the documentation. The examples are generally given as verbatim paragraphs.

Don't just present an example without explaining what it does. Adding a short paragraph saying what the example will do can increase the value of the example immensely.

#### =item `ENVIRONMENT`

Environment variables that the program cares about, normally presented as a list using `C<=over>`, `C<=item>`, and `C<=back>`. For example:

=over 6

=item `HOME`

Used to determine the user's home directory. `F<.foorc>` in this directory is read for configuration details, if it exists.

=back

Since environment variables are normally in all uppercase, no additional special formatting is generally needed; they're glaring enough as it is.

#### =item FILES

All files used by the program or function, normally presented as a list, and what it uses them for. File names should be enclosed in FE<lt>E<gt>. It's particularly important to document files that will be potentially modified.

#### =item CAVEATS

Things to take special care with, sometimes called WARNINGS.

#### =item BUGS

Things that are broken or just don't work quite right.

#### =item RESTRICTIONS

Bugs you don't plan to fix. :-)

#### =item NOTES

Miscellaneous commentary.

#### =item AUTHOR

Who

wrote it (use AUTHORS for multiple people). It's a good idea to include your current e-mail address (or some e-mail address to which bug reports should be sent) or some other contact information so that users have a way of contacting you. Remember that program documentation tends to roam the wild for far longer than you expect and pick a contact method that's likely to last.

#### =item HISTORY

Programs derived from other sources sometimes have this. Some people keep a modification log here, but that usually gets long and is normally better maintained in a separate file.

#### =item COPYRIGHT AND LICENSE

For copyright

Copyright YEAR(s) YOUR NAME(s)

(No, (C) is not needed. No, "all rights reserved" is not needed.)

For licensing the easiest way is to use the same licensing as Perl itself:

This library is free software; you may redistribute it and/or modify it under the same terms as Perl itself.

This makes it easy for people to use your module with Perl. Note that this

licensing example is neither an endorsement or a requirement, you are of course free to choose any licensing.

=item SEE ALSO

Other man pages to check out, like man(1), man(7), makewhatis(8), or catman(8). Normally a simple list of man pages separated by commas, or a paragraph giving the name of a reference work. Man page references, if they use the standard C<name(section)> form, don't have to be enclosed in LE<lt>E<gt> (although it's recommended), but other things in this section probably should be when appropriate.

If the package has a mailing list, include a URL or subscription instructions here.

If the package has a web site, include a URL here.

=back

Documentation of object-oriented libraries or modules may want to use CONSTRUCTORS and METHODS sections, or CLASS METHODS and INSTANCE METHODS sections, for detailed documentation of the parts of the library and save the DESCRIPTION section for an overview. Large modules with a function interface may want to use FUNCTIONS for similar reasons. Some people use OVERVIEW to summarize the description if it's quite long.

Section ordering varies, although NAME must always be the first section (you'll break some man page systems otherwise), and NAME, SYNOPSIS, DESCRIPTION, and OPTIONS generally always occur first and in that order if present. In general, SEE ALSO, AUTHOR, and similar material should be left for last. Some systems also move WARNINGS and NOTES to last. The order given above should be reasonable for most purposes.

Some systems use CONFORMING TO to note conformance to relevant standards and MT-LEVEL to note safeness for use in threaded programs or signal handlers. These headings are primarily useful when documenting parts of a C library.

Finally, as a general note, try not to use an excessive amount of markup. As documented here and in L<Pod::Man>, you can safely leave Perl variables, function names, man page references, and the like unadorned by markup and the POD translators will figure it out for you. This makes it much easier to later edit the documentation. Note that many existing translators will do the wrong thing with e-mail addresses when wrapped in LE<lt>E<gt>, so don't do that.

## =head1 SEE ALSO

For additional information that may be more accurate for your specific system, see either L<man(5)> or L<man(7)> depending on your system manual section numbering conventions.

This documentation is maintained as part of the podlators distribution. The current version is always available from its web site at <<http://www.eyrie.org/~eagle/software/podlators/>>.

=head1 NAME

pod2man - Convert POD data to formatted \*roff input

=head1 SYNOPSIS

```
pod2man [B<--center>=I<string>] [B<--date>=I<string>] [B<--errors>=I<style>]
  [B<--fixed>=I<font>] [B<--fixedbold>=I<font>] [B<--fixeditalic>=I<font>]
  [B<--fixedbolditalic>=I<font>] [B<--name>=I<name>] [B<--nourls>]
  [B<--official>] [B<--quotes>=I<quotes>]
[B<--release>[=I<version>]]
  [B<--section>=I<manext>] [B<--stderr>] [B<--utf8>] [B<--verbose>]
  [I<input> [I<output>] ...]
```

pod2man B<--help>

=head1 DESCRIPTION

B<pod2man> is a front-end for Pod::Man, using it to generate \*roff input from POD source. The resulting \*roff code is suitable for display on a terminal using nroff(1), normally via man(1), or printing using troff(1).

I<input> is the file to read for POD source (the POD can be embedded in code). If I<input> isn't given, it defaults to C<STDIN>. I<output>, if given, is the file to which to write the formatted output. If I<output> isn't given, the formatted output is written to C<STDOUT>. Several POD files can be processed in the same B<pod2man> invocation (saving module load and compile times) by providing multiple pairs of I<input> and I<output> files on the command line.

B<--section>, B<--release>, B<--center>, B<--date>, and B<--official> can be used to set the headers and footers to use; if not given, Pod::Man will assume various defaults. See below or L<Pod::Man> for details.

B<pod2man> assumes that your \*roff formatters have a fixed-width font named C<CW>. If yours is called something else (like C<CR>), use B<--fixed> to specify it. This generally only matters for troff output for printing. Similarly, you can set the fonts used for bold, italic, and bold italic fixed-width output.

Besides the obvious pod conversions, Pod::Man, and therefore pod2man also takes care of formatting func(), func(n), and simple variable references like \$foo or @bar so you don't have to use code escapes for them; complex expressions like C<\$fred{'stuff'}> will still need to be escaped, though. It also translates dashes that aren't used as hyphens into en dashes, makes long dashes--like this--into proper em dashes, fixes "paired quotes," and takes care of several other troff-specific tweaks. See L<Pod::Man> for complete information.

=head1 OPTIONS

=over 4

=item B<-c> I<string>, B<--center>=I<string>

#### Sets

the centered page header to I<string>. The default is "User Contributed Perl Documentation", but also see B<--official> below.

=item B<-d> I<string>, B<--date>=I<string>

Set the left-hand footer string to this value. By default, the modification date of the input file will be used, or the current date if input comes from C<STDIN>.

=item B<-errors>=I<style>

Set the error handling style. C<die> says to throw an exception on any POD formatting error. C<stderr> says to report errors on standard error, but not to throw an exception. C<pod> says to include a POD ERRORS section in the resulting documentation summarizing the errors. C<none> ignores POD errors entirely, as much as possible.

The default is C<die>.

=item B<--fixed>=I<font>

The fixed-width font to use for verbatim text and code. Defaults to C<CW>. Some systems may want C<CR> instead. Only matters for troff(1) output.

=item B<--fixedbold>=I<font>

Bold version of the fixed-width font. Defaults to C<CB>. Only matters for troff(1) output.

=item B<--fixeditalic>=I<font>

Italic version of the fixed-width font (actually, something of a misnomer, since most fixed-width fonts only have an oblique version, not an italic version). Defaults to C<CI>. Only matters for troff(1) output.

=item B<--fixedbolditalic>=I<font>

Bold italic (probably actually oblique) version of the fixed-width font. Pod::Man doesn't assume you have this, and defaults to C<CB>. Some systems (such as Solaris) have this font available as C<CX>. Only matters for troff(1) output.

=item B<-h>, B<--help>

Print out usage information.

=item B<-l>, B<--lax>

No longer used. B<pod2man> used to check its input for validity as a manual page, but this should now be done by L<podchecker(1)> instead. Accepted for backward compatibility; this option no longer does anything.

=item B<-n> I<name>, B<--name>=I<name>

Set the name of the manual page to I<name>. Without this option, the manual name is set to the uppercased base name of the file being converted unless the manual section is 3, in which case the path is parsed to see if it is a Perl module path. If it is, a path like C<../lib/Pod/Man.pm> is converted into a name like C<Pod::Man>. This option, if given, overrides any automatic determination of the name.

Note that this option is probably not useful when converting multiple POD files at once. The convention for Unix man pages for commands is for the man page title to be in all-uppercase even if the command isn't.

=item B<--nourls>

Normally, LZ<><> formatting codes with a URL but anchor text are formatted to show both the anchor text and the URL. In other words:

L<foo|http://example.com/>

is formatted as:

foo <http://example.com/>

This flag, if given, suppresses the URL when anchor text is given, so this example would be formatted as just C<foo>. This can produce less cluttered output in cases where the URLs are not particularly important.

=item B<-o>, B<--official>

Set the default header to indicate that this page is part of the standard Perl release, if B<--center> is not also given.

=item B<-q> I<quotes>, B<--quotes>=I<quotes>

Sets the quote marks used to surround CE<lt>> text to I<quotes>. If

I<quotes> is a single character, it is used as both the left and right quote; if I<quotes> is two characters, the first character is used as the left quote and the second as the right quoted; and if I<quotes> is four characters, the first two are used as the left quote and the second two as the right quote.

I<quotes> may also be set to the special value C<none>, in which case no quote marks are added around CE<lt>> text (but the font is still changed for troff output).

=item B<-r>, B<--release>

Set the centered footer. By default, this is the version of Perl you run B<pod2man> under. Note that some system an macro sets assume that the centered footer will be a modification date and will prepend something like "Last modified: "; if this is the case, you may want to set B<--release> to the last modified date and B<--date> to the version number.

=item B<-s>, B<--section>

Set the section for the C<.TH> macro. The standard section numbering convention is to use 1 for user commands, 2 for system calls, 3 for functions, 4 for devices, 5 for file formats, 6 for games, 7 for miscellaneous information, and 8 for administrator commands. There is a lot of variation here, however; some systems (like Solaris) use 4 for file formats, 5 for miscellaneous information, and 7 for devices. Still others use 1m instead of 8, or some mix of both. About the only section numbers that are reliably consistent are 1, 2, and 3.

By default, section 1 will be used unless the file ends in C<.pm>, in which case section 3 will be selected.

=item B<--stderr>

By default, B<pod2man> dies if any errors are detected in the POD input. If B<--stderr> is given and no B<--errors> flag is present, errors are sent to standard error, but B<pod2man> does not abort. This is equivalent to C<--errors=stderr> and is supported for backward compatibility.

=item B<-u>, B<--utf8>

By default, B<pod2man> produces the most conservative possible \*roff output to try to ensure that it will work with as many different \*roff implementations as possible. Many \*roff implementations cannot handle non-ASCII characters, so this means all non-ASCII characters are converted either to a \*roff escape sequence that tries to create a properly accented

character (at least for troff output) or to C<X>.

This option says to instead output literal UTF-8 characters. If your \*roff implementation can handle it, this is the best output format to use and avoids corruption of documents containing non-ASCII characters. However, be warned that \*roff source with literal UTF-8 characters is not supported by many implementations and may even result in segfaults and other bad behavior.

Be aware that, when using this option, the input encoding of your POD source must be properly declared unless it is US-ASCII or Latin-1. POD input without an C<=encoding> command will be assumed to be in Latin-1, and if it's actually in UTF-8, the output will be double-encoded. See L<perlpod(1)> for more information on the C<=encoding> command.

=item B<-v>, B<--verbose>

Print out the name of each output file as it is being generated.

=back

=head1 EXIT STATUS

As long as all documents processed result in some output, even if that output includes errata (a C<POD ERRORS> section generated with C<--errors=pod>), B<pod2man> will exit with status 0. If any of the documents being processed do not result in an output document, B<pod2man> will exit with status 1. If there are syntax errors in a POD document being processed and the error handling style is set to the default of C<die>, B<pod2man> will abort immediately with exit status 255.

=head1 DIAGNOSTICS

If B<pod2man> fails with errors, see L<Pod::Man> and L<Pod::Simple> for information about what those errors might mean.

=head1

EXAMPLES

```
pod2man program > program.1
pod2man SomeModule.pm /usr/perl/man/man3/SomeModule.3
pod2man --section=7 note.pod > note.7
```

If you would like to print out a lot of man page continuously, you probably want to set the C and D registers to set contiguous page numbering and even/odd paging, at least on some versions of man(7).

troff -man -rC1 -rD1 perl.1 perldata.1 perlsyn.1 ...

To get index entries on C<STDERR>, turn on the F register, as in:

troff -man -rF1 perl.1

The indexing merely outputs messages via C<.tm> for each major page, section, subsection, item, and any C<XE<lt>E<gt>> directives. See L<Pod::Man> for more details.

=head1 BUGS

Lots of this documentation is duplicated from L<Pod::Man>.

=head1 SEE ALSO

L<Pod::Man>, L<Pod::Simple>, L<man(1)>, L<nroff(1)>, L<perlpod(1)>, L<podchecker(1)>, L<perlpodstyle(1)>, L<troff(1)>, L<man(7)>

The man page documenting the an macro set may be L<man(5)> instead of L<man(7)> on your system.

The current

version of this script is always available from its web site at L<<http://www.eyrie.org/~eagle/software/podlators/>>. It is also part of the Perl core distribution as of 5.6.0.

## 1.523 perl-parent 0.225-244.el7

### 1.523.1 Available under license :

No license file was found, but licenses were detected in source scan.

```
=encoding utf8
```

```
=head1 NAME
```

parent - Establish an ISA relationship with base classes at compile time

```
=head1 SYNOPSIS
```

```
package Baz;  
use parent qw(Foo Bar);
```

```
=head1 DESCRIPTION
```

Allows you to both load one or more modules, while setting up inheritance from those modules at the same time. Mostly similar in effect to

```
package Baz;  
BEGIN {  
    require Foo;  
    require Bar;  
    push @ISA, qw(Foo Bar);  
}
```

By default, every base class needs to live in a file of its own.

If you want to have a subclass and its parent class in the same file, you can tell C<parent> not to load any modules by using the C<-norequire> switch:

```
package Foo;  
sub exclaim { "I CAN HAS PERL" }
```

```
package DoesNotLoadFooBar;  
use parent -norequire, 'Foo', 'Bar';  
# will not go looking for Foo.pm or Bar.pm
```

This is equivalent to the following code:

```
package Foo;
sub exclaim { "I CAN HAS PERL" }

package DoesNotLoadFooBar;
push @DoesNotLoadFooBar::ISA, 'Foo', 'Bar';
```

This is also helpful for the case where a package lives within a differently named file:

```
package MyHash;
use Tie::Hash;
use parent -norequire, 'Tie::StdHash';
```

This is equivalent to the following code:

```
package MyHash;
require Tie::Hash;
push @ISA, 'Tie::StdHash';
```

If you want to load a subclass from a file that C<require> would not consider an eligible filename (that is, it does not end in either C<.pm> or C<.pmc>), use the following code:

```
package MySecondPlugin;
require './plugins/custom.plugin'; # contains Plugin::Custom
use parent -norequire, 'Plugin::Custom';
```

=head1 DIAGNOSTICS

=over 4

=item Class 'Foo' tried to inherit from itself

Attempting to inherit from yourself generates a warning.

```
package Foo;
use parent 'Foo';
```

=back

=head1 HISTORY

-----

The libwww-perl collection is a set of Perl modules which provides a simple and consistent application programming interface to the World-Wide Web. The main focus of the library is to provide classes and functions that allow you to write WWW clients. The library also contain modules that are of more general use and even classes that help you implement simple HTTP servers.

### PREREQUISITES

In order to install and use this package you will need Perl version 5.8.1 or better. Some modules within this package depend on other packages that are distributed separately from Perl. We recommend that you have the following packages installed before you install libwww-perl:

Digest-MD5  
Encode-Locale  
HTML-Form  
HTML-Parser  
HTML-Tagset  
HTTP-Cookies  
HTTP-Date  
HTTP-Message  
HTTP-Negotiate  
libnet  
LWP-MediaTypes  
MIME-Base64  
Net-HTTP  
URI  
WWW-RobotRules

If you want to access sites using the https protocol, then you need to install the LWP::Protocol::https module from CPAN.

## INSTALLATION

You install libwww-perl using the normal perl module distribution drill:

```
perl Makefile.PL
make
make test
make install
```

If you don't want to install any programs (only the library files) then pass the '--no-programs' option to Makefile.PL:

```
perl Makefile.PL --no-programs
```

## DOCUMENTATION

See the lib/LWP.pm file for an overview of the library. See the Changes file for recent changes.

POD style documentation is included in all modules and scripts. These are normally converted to manual pages and installed as part of the "make install" process. You should also be able to use the 'perldoc' utility to extract and read documentation from the module files directly.

## SUPPORT

Bug reports and suggestions for improvements can be sent to the <libwww@perl.org> mailing list. This mailing list is also the place for general discussions and development of the libwww-perl package.

## AVAILABILITY

The latest version of libwww-perl is available from CPAN:

```
http://search.cpan.org/dist/libwww-perl/
```

If you want to hack on the source it might be a good idea to grab the latest version with git using the command:

```
git clone git://github.com/libwww-perl/libwww-perl.git lwp
```

You can also browse the git repository at:

<https://github.com/libwww-perl/libwww-perl>

## COPYRIGHT

© 1995-2010 Gisle Aas. All rights reserved.

© 1995 Martijn Koster. All rights reserved.

This library is free software; you can redistribute it and/or modify it under the same terms as Perl itself.

Enjoy!

=head1 NAME

LWP::ConnCache - Connection cache manager

=head1 NOTE

This module is experimental. Details of its interface is likely to change in the future.

=head1 SYNOPSIS

```
use LWP::ConnCache;
my $cache = LWP::ConnCache->new;
$cache->deposit($type, $key, $sock);
$sock = $cache->withdraw($type, $key);
```

=head1 DESCRIPTION

The C<LWP::ConnCache> class is the standard connection cache manager for LWP::UserAgent.

The following basic methods are provided:

=over

=item \$cache = LWP::ConnCache->new( %options )

This method constructs a new C<LWP::ConnCache> object. The only option currently accepted is 'total\_capacity'. If specified it

initialize the total\_capacity option. It defaults to the value 1.

```
=item $cache->total_capacity( [$num_connections] )
```

Get/sets the number of connection that will be cached. Connections will start to be dropped when this limit is reached. If set to C<0>, then all connections are immediately dropped. If set to C<undef>, then there is no limit.

```
=item $cache->capacity($type, [$num_connections] )
```

Get/set a limit for the number of connections of the specified type that can be cached. The \$type will typically be a short string like "http" or "ftp".

```
=item $cache->drop( [$checker, [$reason]] )
```

Drop connections by some criteria. The \$checker argument is a subroutine that is called for each connection. If the routine returns a TRUE value then the connection is dropped. The routine is called with (\$conn, \$type, \$key, \$deposit\_time) as arguments.

Shortcuts: If the \$checker argument is absent (or C<undef>) all cached connections are dropped. If the \$checker is a number then all connections untouched that the given number of seconds or more are dropped. If \$checker is a string then all connections of the given type are dropped.

The \$reason argument is passed on to the dropped() method.

```
=item $cache->prune
```

Calling this method will drop all connections that are dead. This is tested by calling the ping() method on the connections. If the ping() method exists and returns a FALSE value, then the connection is dropped.

```
=item $cache->get_types
```

This returns all the 'type' fields used for the currently cached connections.

```
=item $cache->get_connections( [$type] )
```

This returns all connection objects of the specified type. If no type is specified then all connections are returned. In scalar context the

number of cached connections of the specified type is returned.

=back

The following methods are called by low-level protocol modules to try to save away connections and to get them back.

=over

=item \$cache->deposit(\$type, \$key, \$conn)

This method adds a new connection to the cache. As a result other already cached connections might be dropped. Multiple connections with the same \$type/\$key might added.

=item \$conn = \$cache->withdraw(\$type, \$key)

This method tries to fetch back a connection that was previously deposited. If no cached connection with the specified \$type/\$key is found, then C<undef> is returned. There is not guarantee that a deposited connection can be withdrawn, as the cache manger is free to drop connections at any time.

=back

The following methods are called internally. Subclasses might want to override them.

=over

=item \$conn->enforce\_limits([\$type])

This method is called with after a new connection is added (deposited) in the cache or capacity limits are adjusted. The default implementation drops connections until the specified capacity limits are not exceeded.

=item \$conn->dropping(\$conn\_record, \$reason)

This method is called when a connection is dropped. The record belonging to the dropped connection is passed as the first argument and a string describing the reason for the drop is passed as the second argument. The default implementation makes some noise if the \$LWP::ConnCache::DEBUG variable is set and nothing more.

=back

## =head1 SUBCLASSING

For specialized cache policy it makes sense to subclass C<LWP::ConnCache> and perhaps override the deposit(), enforce\_limits() and dropping() methods.

The object itself is a hash. Keys prefixed with C<cc\_> are reserved for the base class.

## =head1 NAME

LWP::RobotUA - a class for well-behaved Web robots

## =head1 SYNOPSIS

```
use LWP::RobotUA;
my $ua = LWP::RobotUA->new('my-robot/0.1', 'me@foo.com');
$ua->delay(10); # be very nice -- max one hit every ten minutes!
```

...

```
# Then just use it just like a normal LWP::UserAgent:
my $response = $ua->get('http://whatever.int/...');
```

...

## =head1 DESCRIPTION

This class implements a user agent that is suitable for robot applications. Robots should be nice to the servers they visit. They should consult the `F</robots.txt>` file to ensure that they are welcomed and they should not make requests too frequently.

But before you consider writing a robot, take a look at [<URL:http://www.robotstxt.org/>](http://www.robotstxt.org/).

When you use a `I<LWP::RobotUA>` object as your user agent, then you do not really have to think about these things yourself; `C</robots.txt>` files are automatically consulted and obeyed, the server isn't queried too rapidly, and so on. Just send requests as you do when you are using a normal `I<LWP::UserAgent>` object (using `C<< $ua->get(...) >>`, `C<< $ua->head(...) >>`, `C<< $ua->request(...) >>`, etc.), and this special agent will make sure you are nice.

## =head1 METHODS

The `LWP::RobotUA` is a sub-class of `LWP::UserAgent` and implements the same methods. In addition the following methods are provided:

=over 4

=item `$ua = LWP::RobotUA->new( %options )`

=item `$ua = LWP::RobotUA->new( $agent, $from )`

=item `$ua = LWP::RobotUA->new( $agent, $from, $rules )`

The `LWP::UserAgent` options `C</agent>` and `C</from>` are mandatory. The options `C</delay>`, `C</use_sleep>` and `C</rules>` initialize attributes private to the `RobotUA`. If `C</rules>` are not provided, then

C<WWW::RobotRules> is instantiated providing an internal database of F<robots.txt>.

It is also possible to just pass the value of C<agent>, C<from> and optionally C<rules> as plain positional arguments.

```
=item $ua->delay
```

```
=item $ua->delay( $minutes )
```

Get/set

the minimum delay between requests to the same server, in I<minutes>. The default is 1 minute. Note that this number doesn't have to be an integer; for example, this sets the delay to 10 seconds:

```
$ua->delay(10/60);
```

```
=item $ua->use_sleep
```

```
=item $ua->use_sleep( $boolean )
```

Get/set a value indicating whether the UA should sleep() if requests arrive too fast, defined as \$ua->delay minutes not passed since last request to the given server. The default is TRUE. If this value is FALSE then an internal SERVICE\_UNAVAILABLE response will be generated. It will have a Retry-After header that indicates when it is OK to send another request to this server.

```
=item $ua->rules
```

```
=item $ua->rules( $rules )
```

Set/get which I<WWW::RobotRules> object to use.

```
=item $ua->no_visits( $netloc )
```

Returns the number of documents fetched from this server host. Yeah I know, this method should probably have been named num\_visits() or something like that. :-)

```
=item $ua->host_wait( $netloc )
```

Returns the number of I<seconds> (from now) you must wait before you can make a new request to this host.

```
=item $ua->as_string
```

Returns a string that describes the state of the UA.

Mainly useful for debugging.

=head1 NAME

LWP::Protocol - Base class for LWP protocols

=head1 SYNOPSIS

```
package LWP::Protocol::foo;  
require LWP::Protocol;  
@ISA=qw(LWP::Protocol);
```

=head1 DESCRIPTION

This class is used as the base class for all protocol implementations supported by the LWP library.

When creating an instance of this class using `C<LWP::Protocol::create($url)>`, and you get an initialised subclass appropriate for that access method. In other words, the `LWP::Protocol::create()` function calls the constructor for one of its subclasses.

All derived `LWP::Protocol` classes need to override the `request()` method which is used to service a request. The overridden method can make use of the `collect()` function to collect together chunks of data as it is received.

The following methods and functions are provided:

=over 4

=item \$prot = LWP::Protocol->new()

The LWP::Protocol constructor is inherited by subclasses. As this is a virtual base

class this method should B<not> be called directly.

=item \$prot = LWP::Protocol::create(\$scheme)

Create an object of the class implementing the protocol to handle the given scheme. This is a function, not a method. It is more an object factory than a constructor. This is the function user agents should use to access protocols.

=item \$class = LWP::Protocol::implementor(\$scheme, [\$class])

Get and/or set implementor class for a scheme. Returns "" if the specified scheme is not supported.

=item \$prot->request(...)

\$response = \$protocol->request(\$request, \$proxy, undef);

\$response = \$protocol->request(\$request, \$proxy, '/tmp/sss');

\$response = \$protocol->request(\$request, \$proxy, \&callback, 1024);

Dispatches a request over the protocol, and returns a response object. This method needs to be overridden in subclasses. Refer to L<LWP::UserAgent> for description of the arguments.

=item \$prot->collect(\$arg, \$response, \$collector)

Called to collect the content of a request, and process it

appropriately into a scalar, file, or by calling a callback. If \$arg is undefined, then the content is stored within the \$response. If \$arg is a simple scalar, then \$arg is interpreted as a file name and the content is written to this file. If \$arg is a reference to a routine, then content is passed to this routine.

The \$collector is a routine that will be called and which is responsible for returning pieces (as ref to scalar) of the content to process. The \$collector signals EOF by returning a reference to an empty sting.

The return value from collect() is the \$response object reference.

B<Note:> We will only use the callback or file argument if \$response->is\_success(). This avoids sending content data for redirects and authentication responses to the callback which would be confusing.

=item \$prot->collect\_once(\$arg, \$response, \$content)

Can be called when the whole response content is available as \$content. This will invoke collect() with a collector callback that returns a reference to \$content the first time and an empty string the next.

=back

=head1 NAME

LWP - The World-Wide Web library for Perl

=head1 SYNOPSIS

```
use LWP;
print "This is libwww-perl-$LWP::VERSION\n";
```

=head1 DESCRIPTION

The libwww-perl collection is a set of Perl modules which provides a simple and consistent application programming interface (API) to the World-Wide Web. The main focus of the library is to provide classes and functions that allow you to write WWW clients. The library also contain modules that are of more general use and even classes that help you implement simple HTTP servers.

Most modules in this library provide an object oriented API. The user agent, requests sent and responses received from the WWW server are all represented by objects. This makes a simple and powerful interface to these services. The interface is easy to extend and customize for your own needs.

The main features of the library are:

=over 3

=item \*

Contains various reusable components (modules) that can be used separately or together.

=item \*

Provides an object oriented model of HTTP-style communication. Within this framework we currently support access to http, https, gopher, ftp, news, file, and mailto resources.

=item \*

Provides a full object oriented interface or a very simple procedural interface.

=item \*

Supports the basic and digest authorization schemes.

=item \*

Supports transparent redirect handling.

=item \*

Supports access through proxy servers.

=item \*

Provides parser for F<robots.txt> files and a framework for constructing robots.

=item \*

Supports parsing of HTML forms.

=item \*

Implements HTTP content negotiation algorithm that can be used both in protocol modules and in server scripts (like CGI scripts).

=item \*

Supports HTTP cookies.

=item \*

Some simple command line clients, for instance C<lwp-request> and C<lwp-download>.

=back

=head1 HTTP STYLE COMMUNICATION

The libwww-perl library is based on HTTP style communication.

This section tries to describe what that means.

Let us start with this quote from the HTTP specification document <URL:<http://www.w3.org/Protocols/>>:

=over 3

=item

The HTTP protocol is based on a request/response paradigm. A client establishes a connection with a server and sends a request to the server in the form of a request method, URI, and protocol version, followed by a MIME-like message containing request modifiers, client information, and possible body content. The server responds with a

status line, including the message's protocol version and a success or error code, followed by a MIME-like message containing server information, entity meta-information, and possible body content.

=back

What this means to libwww-perl is that communication always take place through these steps: First a I<request> object is created and configured. This object is then passed to a server and we get a I<response> object in return that we can examine. A request is always independent

of any previous requests, i.e. the service is stateless.

The same simple model is used for any kind of service we want to access.

For example, if we want to fetch a document from a remote file server, then we send it a request that contains a name for that document and the response will contain the document itself. If we access a search engine, then the content of the request will contain the query parameters and the response will contain the query result. If we want to send a mail message to somebody then we send a request object which contains our message to the mail server and the response object will contain an acknowledgment that tells us that the message has been accepted and will be forwarded to the recipient(s).

It is as simple as that!

=head2 The Request Object

The libwww-perl request object has the class name C<HTTP::Request>. The fact that the class name uses C<HTTP::> as a prefix only implies that we use the HTTP model of communication. It does not limit the kind of services we can try to pass this I<request> to. For instance, we will send C<HTTP::Request>s both to ftp and gopher servers, as well as to the local file system.

The main attributes of the request objects are:

=over 3

=item \*

B<method> is a short string that tells what kind of request this is. The most common methods are B<GET>, B<PUT>, B<POST> and B<HEAD>.

=item \*

B<uri> is a string denoting the protocol, server and the name of the "document" we want to access. The B<uri> might also encode various other parameters.

=item \*

B<headers> contains additional information about the request and can also used to describe the content. The headers are a set of keyword/value pairs.

=item \*

B<content> is an arbitrary amount of data.

=back

=head2 The Response Object

The libwww-perl response object has the class name C<HTTP::Response>. The main attributes of objects of this class are:

=over 3

=item \*

B<code> is a numerical value that indicates the overall outcome of the request.

=item

\*

B<message> is a short, human readable string that corresponds to the I<code>.

=item \*

B<headers> contains additional information about the response and describe the content.

=item \*

B<content> is an arbitrary amount of data.

=back

Since we don't want to handle all possible I<code> values directly in

our programs, a libwww-perl response object has methods that can be used to query what kind of response this is. The most commonly used response classification methods are:

=over 3

=item is\_success()

The request was successfully received, understood or accepted.

=item is\_error()

The request failed. The server or the resource might not be available, access to the resource might be denied or other things might have failed for some reason.

=back

=head2 The User Agent

Let us assume that we have created a I<request> object. What do we actually do with it in order to receive a I<response>?

The answer is that you pass it to a I<user agent> object and this object takes care of all the things that need to be done (like low-level communication and error handling) and returns a I<response> object. The user agent represents your application on the network and provides you with an interface that can accept I<requests> and return I<responses>.

The user agent is an interface layer between your application code and the network. Through this interface you are able to access the various servers on the network.

The class name for the user agent is C<LWP::UserAgent>. Every libwww-perl application that wants to communicate should create at least one object of this class. The main method provided by this object is request(). This method takes an C<HTTP::Request> object as argument and (eventually) returns a C<HTTP::Response> object.

The user agent has many other attributes that let you configure how it will interact with the network and with your application.

=over 3

=item \*

B<timeout> specifies how much time we give remote servers to respond before the library disconnects and creates an internal I<timeout> response.

=item \*

B<agent> specifies the name that your application uses when it presents itself on the network.

=item \*

B<from> can be set to the e-mail address of the person responsible for running the application. If this is set, then the address will be sent to the servers with every request.

=item \*

B<parse\_head> specifies whether we should initialize response headers from the E<lt>head> section of HTML documents.

=item \*

B<proxy> and B<no\_proxy> specify if and when to go through a proxy server. <URL:<http://www.w3.org/History/1994/WWW/Proxies/>>

=item \*

B<credentials> provides a way to set up user names and passwords needed to access certain services.

=back

Many applications want even more control over how they interact with the network and they get this by sub-classing C<LWP::UserAgent>. The library includes a sub-class, C<LWP::RobotUA>, for robot applications.

=head2 An Example

This example shows how the user agent, a request and a response are represented in actual perl code:

```
# Create a user agent object
use LWP::UserAgent;
my $ua = LWP::UserAgent->new;
```

```

$ua->agent("MyApp/0.1 ");

# Create a request
my $req = HTTP::Request->new(POST => 'http://search.cpan.org/search');
$req->content_type('application/x-www-form-urlencoded');
$req->content('query=libwww-perl&mode=dist');

# Pass request to the user agent and get a response back
my $res = $ua->request($req);

# Check the outcome of the response
if ($res->is_success) {
    print $res->content;
}
else {
    print $res->status_line, "\n";
}

```

The \$ua is created once when the application starts up. New request objects should normally be created for each request sent.

## =head1 NETWORK SUPPORT

This section discusses the various protocol schemes and the HTTP style methods that headers may be used for each.

For all requests, a "User-Agent" header is added and initialized from the \$ua->agent attribute before the request is handed to the network layer. In the same way, a "From" header is initialized from the \$ua->from attribute.

For all responses, the library adds a header called "Client-Date". This header holds the time when the response was received by your application. The format and semantics of the header are the same as the server created "Date" header. You may also encounter other "Client-XXX" headers. They are all generated by the library internally and are not received from the servers.

## =head2 HTTP Requests

HTTP requests are just handed off to an HTTP server and it decides what happens. Few servers implement methods beside the usual "GET", "HEAD", "POST" and "PUT", but CGI-scripts may implement any method they like.

If the server is not available then the library will generate an

internal error response.

The library automatically adds a "Host" and a "Content-Length" header to the HTTP request before it is sent over the network.

For a GET request you might want to add a "If-Modified-Since" or "If-None-Match" header to make the request conditional.

For a POST request you should add the "Content-Type" header. When you try to emulate HTML E<lt>FORM> handling you should usually let the value of the "Content-Type" header be "application/x-www-form-urlencoded". See L<lwpcook> for examples of this.

The libwww-perl HTTP implementation currently support the HTTP/1.1 and HTTP/1.0 protocol.

The library allows you to access proxy server through HTTP. This means that you can set up the library to forward all types of request through the HTTP protocol module. See L<LWP::UserAgent> for documentation of this.

#### =head2 HTTPS Requests

HTTPS requests are HTTP requests over an encrypted network connection using the SSL protocol developed by Netscape. Everything about HTTP requests above also apply to HTTPS requests. In addition the library will add the headers "Client-SSL-Cipher", "Client-SSL-Cert-Subject" and "Client-SSL-Cert-Issuer" to the response. These headers denote the encryption method used and the name of the server owner.

The request can contain the header "If-SSL-Cert-Subject" in order to make the request conditional on the content of the server certificate. If the certificate subject does not match, no request is sent to the server and an internally generated error response is returned. The value of the "If-SSL-Cert-Subject" header is interpreted as a Perl regular expression.

#### =head2 FTP Requests

The library currently supports GET, HEAD and PUT requests. GET retrieves a file or a directory listing from an FTP server. PUT stores a file on a ftp server.

You can specify a ftp account for servers that want this in addition

to user name and password. This is specified by including an "Account" header in the request.

User name/password can be specified using basic authorization or be encoded in the URL. Failed logins return an UNAUTHORIZED response with "WWW-Authenticate: Basic" and can be treated like basic authorization for HTTP.

The library supports ftp ASCII transfer mode by specifying the "type=a" parameter in the URL. It also supports transfer of ranges for FTP transfers using the "Range" header.

Directory listings are by default returned unprocessed (as returned from the ftp server) with the content media type reported to be "text/ftp-dir-listing". The C<File::Listing> module provides methods for parsing of these directory listing.

The ftp module is also able to convert directory listings to HTML and this can be requested via the standard HTTP content negotiation mechanisms (add an "Accept: text/html" header in the request if you want this).

For normal file retrievals, the "Content-Type" is guessed based on the file name suffix. See L<LWP::MediaTypes>.

The "If-Modified-Since" request header works for servers that implement the MDTM command. It will probably not work for directory listings though.

Example:

```
$req = HTTP::Request->new(GET => 'ftp://me:passwd@ftp.some.where.com/');  
$req->header(Accept =>  
"text/html, */*;q=0.1");
```

=head2 News Requests

Access to the USENET News system is implemented through the NNTP protocol. The name of the news server is obtained from the NNTP\_SERVER environment variable and defaults to "news". It is not possible to specify the hostname of the NNTP server in news: URLs.

The library supports GET and HEAD to retrieve news articles through the NNTP protocol. You can also post articles to newsgroups by using (surprise!) the POST method.

GET on newsgroups is not implemented yet.

Examples:

```
$req = HTTP::Request->new(GET => 'news:abc1234@a.sn.no');

$req = HTTP::Request->new(POST => 'news:comp.lang.perl.test');
$req->header(Subject => 'This is a test',
            From => 'me@some.where.org');
$req->content(<<EOT);
This is the content of the message that we are sending to
the world.
EOT
```

#### =head2 Gopher Request

The library supports the GET and HEAD methods for gopher requests. All request header values are ignored. HEAD cheats and returns a response without even talking to server.

Gopher menus are always converted to HTML.

The response "Content-Type" is generated from the document type encoded (as the first letter) in the request URL path itself.

Example:

```
$req = HTTP::Request->new(GET => 'gopher://gopher.sn.no/');
```

#### =head2 File Request

The library supports GET and HEAD methods for file requests. The "If-Modified-Since" header is supported. All other headers are ignored. The I<host> component of the file URL must be empty or set to "localhost". Any other I<host> value will be treated as an error.

Directories are always converted to an HTML document. For normal files, the "Content-Type" and "Content-Encoding" in the response are guessed based on the file suffix.

Example:

```
$req = HTTP::Request->new(GET => 'file:/etc/passwd');
```

#### =head2 Mailto Request

You can send (aka "POST") mail messages using the library. All headers specified for the request are passed on to the mail system. The "To" header is initialized from the mail address in the URL.

Example:

```
$req = HTTP::Request->new(POST => 'mailto:libwww@perl.org');  
$req->header(Subject => "subscribe");  
$req->content("Please subscribe me to the libwww-perl mailing list!\n");
```

=head2 CPAN Requests

URLs with scheme C<cpan:> are redirected to the a suitable CPAN mirror. If you have your own local mirror of CPAN you might tell LWP to use it for C<cpan:> URLs by an assignment like this:

```
$LWP::Protocol::cpan::CPAN = "file:/local/CPAN/";
```

Suitable CPAN mirrors are also picked up from the configuration for the CPAN.pm, so if you have used that module a suitable mirror should be picked automatically. If neither of these apply, then a redirect to the generic CPAN http location is issued.

Example request to download the newest perl:

```
$req = HTTP::Request->new(GET => "cpan:src/latest.tar.gz");
```

=head1 OVERVIEW OF CLASSES AND PACKAGES

This table should give you a quick overview of the classes provided by the library. Indentation shows class inheritance.

```
LWP::MemberMixin -- Access to member variables of Perl5 classes  
LWP::UserAgent -- WWW user agent class  
  LWP::RobotUA -- When developing a robot applications  
LWP::Protocol -- Interface to various protocol schemes  
  LWP::Protocol::http -- http:// access  
  LWP::Protocol::file -- file:// access  
  LWP::Protocol::ftp -- ftp:// access  
  ...
```

```
LWP::Authen::Basic -- Handle 401 and 407 responses  
LWP::Authen::Digest
```

HTTP::Headers -- MIME/RFC822 style header (used by HTTP::Message)  
HTTP::Message -- HTTP style message  
HTTP::Request -- HTTP request  
HTTP::Response -- HTTP response  
HTTP::Daemon -- A HTTP server class

WWW::RobotRules -- Parse robots.txt files  
WWW::RobotRules::AnyDBM\_File -- Persistent RobotRules

Net::HTTP -- Low level HTTP client

The following modules provide various functions and definitions.

LWP -- This file. Library version number and documentation.  
LWP::MediaTypes -- MIME types configuration (text/html etc.)  
LWP::Simple -- Simplified procedural interface for common functions  
HTTP::Status -- HTTP status code (200 OK etc)  
HTTP::Date -- Date parsing module for HTTP date formats  
HTTP::Negotiate -- HTTP content negotiation calculation  
File::Listing -- Parse directory listings  
HTML::Form -- Processing for <form>s in HTML documents

=head1 MORE DOCUMENTATION

All modules contain detailed information on the interfaces they provide. The L<lwpcook> manpage is the libwww-perl cookbook that contain examples of typical usage of the library. You might want to take a look at how the scripts L<lwp-request>, L<lwp-download>, L<lwp-dump> and L<lwp-mirror> are implemented.

=head1 ENVIRONMENT

The following environment variables are used by LWP:

=over

=item HOME

The C<LWP::MediaTypes> functions will look for the F<.media.types> and F<.mime.types> files relative to you home directory.

=item

http\_proxy

=item ftp\_proxy

=item xxx\_proxy

=item no\_proxy

These environment variables can be set to enable communication through a proxy server. See the description of the C<env\_proxy> method in L<LWP::UserAgent>.

=item PERL\_LWP\_ENV\_PROXY

If set to a TRUE value, then the C<LWP::UserAgent> will by default call C<env\_proxy> during initialization. This makes LWP honor the proxy variables described above.

=item PERL\_LWP\_SSL\_VERIFY\_HOSTNAME

The default C<verify\_hostname> setting for C<LWP::UserAgent>. If not set the default will be 1. Set it as 0 to disable hostname verification (the default prior to libwww-perl 5.840).

=item PERL\_LWP\_SSL\_CA\_FILE

=item PERL\_LWP\_SSL\_CA\_PATH

The file and/or directory where the trusted Certificate Authority certificates is located. See L<LWP::UserAgent> for details.

=item PERL\_HTTP\_URI\_CLASS

Used to decide what URI objects to instantiate. The default is C<URI>. You might want to set it to C<URI::URL> for compatibility with old times.

=back

=head1 NAME

lwpcook - The libwww-perl cookbook

=head1 DESCRIPTION

This document contain some examples that show typical usage of the libwww-perl library. You should consult the documentation for the individual modules for more detail.

All examples should be runnable programs. You can, in most cases, test the code sections by piping the program text directly to perl.

=head1 GET

It is very easy to use this library to just fetch documents from the net. The LWP::Simple module provides the get() function that return the document specified by its URL argument:

```
use LWP::Simple;
$doc = get 'http://search.cpan.org/dist/libwww-perl/';
```

or, as a perl one-liner using the getprint() function:

```
perl -MLWP::Simple -e 'getprint "http://search.cpan.org/dist/libwww-perl/"'
```

or, how about fetching the latest perl by running this command:

```
perl -MLWP::Simple -e '
  getstore "ftp://ftp.sunet.se/pub/lang/perl/CPAN/src/latest.tar.gz",
  "perl.tar.gz"
```

You will probably first want to find a CPAN site closer to you by running something like the following command:

```
perl -MLWP::Simple -e 'getprint "http://www.cpan.org/SITES.html"'
```

Enough of this simple stuff! The LWP object oriented interface gives you more control over the request sent to the server. Using this interface you have full control over headers sent and how you want to handle the response returned.

```
use LWP::UserAgent;
```

```

$ua = LWP::UserAgent->new;
$ua->agent("$0/0.1 " . $ua->agent);
# $ua->agent("Mozilla/8.0") # pretend we are very capable browser

$req = HTTP::Request->new(
    GET => 'http://search.cpan.org/dist/libwww-perl/');
$req->header('Accept' => 'text/html');

# send request
$res = $ua->request($req);

# check the outcome
if ($res->is_success) {
    print $res->decoded_content;
}
else {
    print "Error: " . $res->status_line . "\n";
}

```

The lwp-request program (alias GET) that is distributed with the library can also be used to fetch documents from WWW servers.

```
=head1 HEAD
```

If you just want to check if a document is present (i.e. the URL is valid) try to run code that looks like this:

```

use LWP::Simple;

if (head($url)) {
    # ok document exists
}

```

The head() function really returns a list of meta-information about the document. The first three values of the list returned are the document type, the size of the document, and the age of the document.

More control over the request or access to all header values returned require that you use the object oriented interface described for GET above. Just s/GET/HEAD/g.

```
=head1 POST
```

There is no simple procedural interface for posting data to a WWW server. You

must use the object oriented interface for this. The most common POST operation is to access a WWW form application:

```
use LWP::UserAgent;
$ua = LWP::UserAgent->new;

my $req = HTTP::Request->new(
    POST => 'http://rt.cpan.org/Public/Dist/Display.html');
$req->content_type('application/x-www-form-urlencoded');
$req->content('Status=Active&Name=libwww-perl');

my $res = $ua->request($req);
print $res->as_string;
```

Lazy people use the HTTP::Request::Common module to set up a suitable POST request message (it handles all the escaping issues) and has a suitable default for the content\_type:

```
use HTTP::Request::Common qw(POST);
use LWP::UserAgent;
$ua = LWP::UserAgent->new;

my $req = POST 'http://rt.cpan.org/Public/Dist/Display.html',
    [ Status => 'Active', Name => 'libwww-perl' ];

print $ua->request($req)->as_string;
```

The lwp-request program (alias POST) that is distributed with the library can also be used for posting data.

=head1 PROXIES

Some sites use proxies to go through fire wall machines, or just as cache in order to improve performance. Proxies can also be used for accessing resources through protocols not supported directly (or supported badly :- ) by the libwww-perl library.

You should initialize your proxy setting before you start sending requests:

```
use LWP::UserAgent;
$ua = LWP::UserAgent->new;
$ua->env_proxy; # initialize from environment variables
# or
$ua->proxy(ftp => 'http://proxy.myorg.com');
```

```
$ua->proxy(wais => 'http://proxy.myorg.com');
$ua->no_proxy(qw(no se fi));
```

```
my $req = HTTP::Request->new(GET => 'wais://xxx.com/');
print $ua->request($req)->as_string;
```

The LWP::Simple interface will call `env_proxy()` for you automatically. Applications that use the `$ua->env_proxy()` method will normally not use the `$ua->proxy()` and `$ua->no_proxy()` methods.

Some proxies also require that you send it a username/password in order to let requests through. You should be able to add the required header, with something like this:

```
use LWP::UserAgent;
```

```
$ua = LWP::UserAgent->new;
$ua->proxy(['http', 'ftp'] => 'http://username:password@proxy.myorg.com');
```

```
$req = HTTP::Request->new('GET', "http://www.perl.com");
```

```
$res = $ua->request($req);
print $res->decoded_content
if $res->is_success;
```

Replace `C<proxy.myorg.com>`, `C<username>` and `C<password>` with something suitable for your site.

```
=head1 ACCESS TO PROTECTED DOCUMENTS
```

Documents protected by basic authorization can easily be accessed like this:

```
use LWP::UserAgent;
$ua = LWP::UserAgent->new;
$req = HTTP::Request->new(GET => 'http://www.linpro.no/secret/');
$req->authorization_basic('aas', 'mypassword');
print $ua->request($req)->as_string;
```

The other alternative is to provide a subclass of `I<LWP::UserAgent>` that overrides the `get_basic_credentials()` method. Study the `I<lwp-request>` program for an example of this.

```
=head1 COOKIES
```

Some sites like to play games with cookies. By default LWP ignores

cookies provided by the servers it visits. LWP will collect cookies and respond to cookie requests if you set up a cookie jar.

```
use LWP::UserAgent;
use HTTP::Cookies;

$ua = LWP::UserAgent->new;
$ua->cookie_jar(HTTP::Cookies->new(file => "lwpcookies.txt",
    autosave
=> 1));

# and then send requests just as you used to do
$res = $ua->request(HTTP::Request->new(GET => "http://no.yahoo.com/"));
print $res->status_line, "\n";
```

As you visit sites that send you cookies to keep, then the file `F<lwpcookies.txt">` will grow.

=head1 HTTPS

URLs with https scheme are accessed in exactly the same way as with http scheme, provided that an SSL interface module for LWP has been properly installed (see the `F<README.SSL>` file found in the libwww-perl distribution for more details). If no SSL interface is installed for LWP to use, then you will get "501 Protocol scheme 'https' is not supported" errors when accessing such URLs.

Here's an example of fetching and printing a WWW page using SSL:

```
use LWP::UserAgent;

my $ua = LWP::UserAgent->new;
my $req = HTTP::Request->new(GET => 'https://www.helsinki.fi/');
my $res = $ua->request($req);
if ($res->is_success) {
    print $res->as_string;
}
else {
    print "Failed: ", $res->status_line, "\n";
}
```

=head1 MIRRORING

If you want to mirror documents from a WWW server, then try to run code similar to this at regular intervals:

```
use LWP::Simple;
```

```
%mirrors = (
    'http://www.sn.no/'           => 'sn.html',
    'http://www.perl.com/'       => 'perl.html',
    'http://search.cpan.org/distlibwww-perl/' => 'lwp.html',
    'gopher://gopher.sn.no/'     => 'gopher.html',
);
```

```
while (($url, $localfile) = each(%mirrors)) {
    mirror($url, $localfile);
}
```

Or, as a perl one-liner:

```
perl -MLWP::Simple -e 'mirror("http://www.perl.com/", "perl.html");'
```

The document will not be transferred unless it has been updated.

#### =head1 LARGE DOCUMENTS

If the document you want to fetch is too large to be kept in memory, then you have two alternatives. You can instruct the library to write the document content to a file (second `$ua->request()` argument is a file name):

```
use LWP::UserAgent;
$ua = LWP::UserAgent->new;

my $req = HTTP::Request->new(GET
=>
    'http://www.cpan.org/authors/Gisle_Aas/libwww-perl-6.02.tar.gz');
$res = $ua->request($req, "libwww-perl.tar.gz");
if ($res->is_success) {
    print "ok\n";
}
else {
    print $res->status_line, "\n";
}
```

Or you can process the document as it arrives (second `$ua->request()` argument is a code reference):

```
use LWP::UserAgent;
$ua = LWP::UserAgent->new;
$URL = 'ftp://ftp.unit.no/pub/rfc/rfc-index.txt';
```

```

my $expected_length;
my $bytes_received = 0;
my $res =
    $ua->request(HTTP::Request->new(GET => $URL),
        sub {
            my($chunk, $res) = @_;
            $bytes_received += length($chunk);
            unless (defined $expected_length) {
                $expected_length = $res->content_length || 0;
            }
            if ($expected_length) {
                printf STDERR "%d%% - ",
                    100 * $bytes_received / $expected_length;
            }
            print STDERR "$bytes_received bytes
received\n";

            # XXX Should really do something with the chunk itself
            # print $chunk;
        });
print $res->status_line, "\n";

```

=head1 NAME

lwptut -- An LWP Tutorial

=head1 DESCRIPTION

LWP (short for "Library for WWW in Perl") is a very popular group of Perl modules for accessing data on the Web. Like most Perl module-distributions, each of LWP's component modules comes with documentation that is a complete reference to its interface. However, there are so many modules in LWP that it's hard to know where to start looking for information on how to do even the simplest most common

things.

Really introducing you to using LWP would require a whole book -- a book that just happens to exist, called *Perl & LWP*. But this article should give you a taste of how you can go about some common tasks with LWP.

=head2 Getting documents with LWP::Simple

If you just want to get what's at a particular URL, the simplest way to do it is LWP::Simple's functions.

In a Perl program, you can call its `C<get($url)>` function. It will try getting that URL's content.

If it works, then it'll return the content; but if there's some error, it'll return undef.

```
my $url = 'http://www.npr.org/programs/fa/?todayDate=current';
# Just an example: the URL for the most recent /Fresh Air/ show
```

```
use LWP::Simple;
my $content = get $url;
die "Couldn't get $url" unless defined $content;
```

```
# Then go do things with $content, like this:
```

```
if($content =~ m/jazz/i) {
    print "They're talking about jazz today on Fresh Air!\n";
}
else {
    print "Fresh Air is apparently jazzless today.\n";
}
```

The handiest variant on `C<get>` is `C<getprint>`, which is useful in Perl one-liners. If it can get the page whose URL you provide, it sends it to STDOUT; otherwise it complains to STDERR.

```
% perl -MLWP::Simple -e "getprint 'http://www.cpan.org/RECENT'"
```

That is the URL of a plain text file that lists new files in CPAN in the past two weeks. You can easily make it part of a tidy little shell command, like this one that mails you the list of new `C<Acme::>` modules:

```
% perl -MLWP::Simple -e "getprint 'http://www.cpan.org/RECENT'" \
| grep "/by-module/Acme" | mail -s "New Acme modules! Joy!" $USER
```

There are other useful functions in `LWP::Simple`, including one function for running a `HEAD` request on a URL (useful for checking links, or getting the last-revised time of a URL), and two functions for saving/mirroring a URL to a local file. See [the LWP::Simple documentation](#) for the full details, or chapter 2 of [Perl & LWP](#) for more examples.

```
=for comment
```

```
#####
```

```
=head2 The Basics of the LWP Class Model
```

`LWP::Simple`'s functions are handy for simple cases, but its functions don't support cookies or authorization, don't support setting header lines in the HTTP request, generally don't support reading header lines in the HTTP response (notably the full HTTP error message, in case of an error). To get at all those features, you'll have to use the full LWP class model.

While LWP consists of dozens of classes, the main two that you have to understand are `LWP::UserAgent` and `LWP::Response`. `LWP::UserAgent` is a class for "virtual browsers" which you use for performing requests, and `LWP::Response` is a class for the responses (or error messages) that you get back from those requests.

The basic idiom is `C<< $response = $browser->get($url) >>`, or more fully illustrated:

```
# Early in your program:

use LWP 5.64; # Loads all important LWP classes, and makes
             # sure your version is reasonably recent.

my $browser = LWP::UserAgent->new;

...

# Then later, whenever you need to make a get request:
my $url = 'http://www.npr.org/programs/fa/?todayDate=current';

my $response = $browser->get( $url );
die "Can't get $url -- ", $response->status_line
```

```

unless $response->is_success;

die "Hey, I was expecting HTML, not ", $response->content_type
unless $response->content_type eq 'text/html';
# or whatever content-type you're equipped to deal with

# Otherwise, process the content somehow:

if($response->decoded_content =~ m/jazz/i) {
    print "They're talking about jazz today on Fresh Air!\n";
}
else {
    print "Fresh Air is apparently jazzless today.\n";
}

```

There are two objects involved: C<\$browser>, which holds an object of class LWP::UserAgent, and then the C<\$response> object, which is of class HTTP::Response. You really need only one browser object per program; but every time you make a request, you get back a new HTTP::Response object, which will have some interesting attributes:

=over

=item \*

A status code indicating success or failure (which you can test with C<< \$response->is\_success >>).

=item \*

An HTTP status line that is hopefully informative if there's failure (which you can see with C<< \$response->status\_line >>, returning something like "404 Not Found").

=item \*

A MIME content-type like "text/html", "image/gif", "application/xml", etc., which you can see with C<< \$response->content\_type >>

=item \*

The actual content of the response, in C<< \$response->decoded\_content >>. If the response is HTML, that's where the HTML source will be; if it's a GIF, then C<< \$response->decoded\_content >> will be the binary

GIF data.

=item \*

And dozens of other convenient and more specific methods that are documented in the docs for L<HTTP::Response>, and its superclasses L<HTTP::Message> and L<HTTP::Headers>.

=back

=for comment

```
#####
```

=head2 Adding Other HTTP Request Headers

The most commonly used syntax for requests is C<< \$response = \$browser->get(\$url) >>, but in truth, you can add extra HTTP header lines to the request by adding a list of key-value pairs after the URL, like so:

```
$response = $browser->get( $url, $key1, $value1, $key2, $value2, ... );
```

For example, here's how to send some more Netscape-like headers, in case you're dealing with a site that would otherwise reject your request:

```
my @ns_headers = (  
  'User-Agent' => 'Mozilla/4.76 [en] (Win98; U)',  
  'Accept' => 'image/gif, image/x-xbitmap, image/jpeg, image/pjpeg, image/png, */*',  
  'Accept-Charset' => 'iso-8859-1,*,utf-8',  
  'Accept-Language' => 'en-US',  
);
```

...

```
$response = $browser->get($url, @ns_headers);
```

If you weren't reusing that array, you could just go ahead and do this:

```
$response = $browser->get($url,  
  'User-Agent' => 'Mozilla/4.76 [en] (Win98; U)',  
  'Accept' => 'image/gif, image/x-xbitmap, image/jpeg, image/pjpeg, image/png, */*',  
  'Accept-Charset' => 'iso-8859-1,*,utf-8',
```

```
'Accept-Language' => 'en-US',
);
```

If you were only ever changing the 'User-Agent' line, you could just change the C<\$browser> object's default line from "libwww-perl/5.65" (or the like) to whatever you like, using the LWP::UserAgent C<agent> method:

```
$browser->agent('Mozilla/4.76 [en] (Win98; U)');
```

```
=for comment
```

```
#####
```

```
=head2
```

## Enabling Cookies

A default LWP::UserAgent object acts like a browser with its cookies support turned off. There are various ways of turning it on, by setting its C<cookie\_jar> attribute. A "cookie jar" is an object representing a little database of all the HTTP cookies that a browser can know about. It can correspond to a file on disk (the way Netscape uses its F<cookies.txt> file), or it can be just an in-memory object that starts out empty, and whose collection of cookies will disappear once the program is finished running.

To give a browser an in-memory empty cookie jar, you set its C<cookie\_jar> attribute like so:

```
$browser->cookie_jar({});
```

To give it a copy that will be read from a file on disk, and will be saved to it when the program is finished running, set the C<cookie\_jar> attribute like this:

```
use HTTP::Cookies;
$browser->cookie_jar( HTTP::Cookies->new(
    'file' => '/some/where/cookies.lwp',
    # where to read/write
    cookies
    'autosave' => 1,
    # save it to disk when done
));
```

That file will be an LWP-specific format. If you want to be access the cookies in your Netscape cookies file, you can use the

HTTP::Cookies::Netscape class:

```
use HTTP::Cookies;
# yes, loads HTTP::Cookies::Netscape too

$browser->cookie_jar( HTTP::Cookies::Netscape->new(
  'file' => 'c:/Program Files/Netscape/Users/DIR-NAME-HERE/cookies.txt',
  # where to read cookies
));
```

You could add an `C<< 'autosave' => 1 >>` line as further above, but at time of writing, it's uncertain whether Netscape might discard some of the cookies you could be writing back to disk.

```
=for comment
#####
```

=head2 Posting Form Data

Many HTML forms send data to their server using an HTTP POST request, which you can send with this syntax:

```
$response = $browser->post( $url,
[
  formkey1 => value1,
  formkey2 => value2,
  ...
],
);
```

Or  
if you need to send HTTP headers:

```
$response = $browser->post( $url,
[
  formkey1 => value1,
  formkey2 => value2,
  ...
],
headerkey1 => value1,
headerkey2 => value2,
);
```

For example, the following program makes a search request to AltaVista

(by sending some form data via an HTTP POST request), and extracts from the HTML the report of the number of matches:

```
use strict;
use warnings;
use LWP 5.64;
my $browser = LWP::UserAgent->new;

my $word = 'tarragon';

my $url = 'http://search.yahoo.com/yhs/search';
my $response = $browser->post( $url,
    [ 'q' => $word, # the Altavista query string
      'fr' => 'altavista', 'pg' => 'q', 'avkw' => 'tgz', 'kl' => 'XX',
    ]
);
die "$url error: ", $response->status_line
    unless $response->is_success;
die "Weird content type at $url -- ", $response->content_type
    unless $response->content_is_html;

if( $response->decoded_content =~ m{([0-9,]+)(?:<.*?>)? results for } ) {
    # The substring
    will be like "996,000</strong> results for"
    print "$word: $1\n";
}
else {
    print "Couldn't find the match-string in the response\n";
}

=for comment
#####
```

=head2 Sending GET Form Data

Some HTML forms convey their form data not by sending the data in an HTTP POST request, but by making a normal GET request with the data stuck on the end of the URL. For example, if you went to C<www.imdb.com> and ran a search on "Blade Runner", the URL you'd see in your browser window would be:

```
http://www.imdb.com/find?s=all&q=Blade+Runner
```

To run the same search with LWP, you'd use this idiom, which involves

the URI class:

```
use URI;
my $url = URI->new( 'http://www.imdb.com/find' );
# makes an object representing the URL

$url->query_form( # And here the form data pairs:
  'q' => 'Blade Runner',
  's' => 'all',
);

my $response = $browser->get($url);
```

See chapter 5 of *Perl & LWP* for a longer discussion of HTML forms and of form data, and chapters 6 through 9 for a longer discussion of extracting data from HTML.

## =head2 Absolutizing URLs

The URI class that we just mentioned above provides all sorts of methods for accessing and modifying parts of URLs (such as asking sort of URL it is with `C<< $url->scheme >>`, and asking what host it refers to with `C<< $url->host >>`, and so on, as described in *the docs for the URI class|URI*). However, the methods of most immediate interest are the `C<query_form>` method seen above, and now the `C<new_abs>` method for taking a probably-relative URL string (like `../foo.html`) and getting back an absolute URL (like `http://www.perl.com/stuff/foo.html`), as shown here:

```
use URI;
$abs = URI->new_abs($maybe_relative, $base);
```

For example, consider this program that matches URLs in the HTML list of new modules in CPAN:

```
use strict;
use warnings;
use LWP;
my $browser = LWP::UserAgent->new;

my $url = 'http://www.cpan.org/RECENT.html';
my $response = $browser->get($url);
die "Can't get $url -- ", $response->status_line
unless $response->is_success;
```

```
my $html = $response->decoded_content;
while( $html =~ m/<A HREF="(.*?)"/g ) {
    print "$1\n";
}
```

When run, it emits output that starts out something like this:

```
MIRRORING.FROM
RECENT
RECENT.html
authors/00whois.html
authors/01mailrc.txt.gz
authors/id/A/AA/AASSAD/CHECKSUMS
...
```

However, if you actually want to have those be absolute URLs, you can use the URI module's `C<new_abs>` method, by changing the `C<while>` loop to this:

```
while( $html =~ m/<A HREF="(.*?)"/g ) {
    print URI->new_abs( $1, $response->base ), "\n";
}
```

(The `C<< $response->base >>` method from `L<HTTP::Message|HTTP::Message>` is for returning what URL should be used for resolving relative URLs -- it's usually just the same as the URL that you requested.)

That program then emits nicely absolute URLs:

```
http://www.cpan.org/MIRRORING.FROM
http://www.cpan.org/RECENT
http://www.cpan.org/RECENT.html
http://www.cpan.org/authors/00whois.html
http://www.cpan.org/authors/01mailrc.txt.gz
http://www.cpan.org/authors/id/A/AA/AASSAD/CHECKSUMS
...
```

See chapter 4 of `I<Perl & LWP>` for a longer discussion of URI objects.

Of course, using a regexp to match hrefs is a bit simplistic, and for more robust programs, you'll probably want to use an HTML-parsing module like `L<HTML::LinkExtor>` or `L<HTML::TokeParser>` or even maybe `L<HTML::TreeBuilder>`.

=for comment

```
#####
```

=head2 Other Browser Attributes

LWP::UserAgent objects have many attributes for controlling how they work. Here are a few notable ones:

=over

=item \*

```
C<< $browser->timeout(15); >>
```

This sets this browser object to give up on requests that don't answer within 15 seconds.

=item \*

```
C<< $browser->protocols_allowed( [ 'http', 'gopher' ] ); >>
```

This sets this browser object to not speak any protocols other than HTTP and

gopher. If it tries accessing any other kind of URL (like an "ftp:" or "mailto:" or "news:" URL), then it won't actually try connecting, but instead will immediately return an error code 500, with a message like "Access to 'ftp' URIs has been disabled".

=item \*

```
C<< use LWP::ConnCache; $browser->conn_cache(LWP::ConnCache->new()); >>
```

This tells the browser object to try using the HTTP/1.1 "Keep-Alive" feature, which speeds up requests by reusing the same socket connection for multiple requests to the same server.

=item \*

```
C<< $browser->agent( 'SomeName/1.23 (more info here maybe)' ) >>
```

This changes how the browser object will identify itself in the default "User-Agent" line in its HTTP requests. By default, it'll send "libwww-perl/I<versionnumber>", like "libwww-perl/5.65". You can change that to something more descriptive like this:

```
$browser->agent( 'SomeName/3.14 (contact@robotplexus.int)' );
```

Or if need be, you can go in disguise, like this:

```
$browser->agent( 'Mozilla/4.0  
(compatible; MSIE 5.12; Mac_PowerPC)' );
```

```
=item *
```

```
C<< push @ { $ua->requests_redirectable }, 'POST'; >>
```

This tells this browser to obey redirection responses to POST requests (like most modern interactive browsers), even though the HTTP RFC says that should not normally be done.

```
=back
```

For more options and information, see [L<the full documentation for LWP::UserAgent|LWP::UserAgent>](#).

```
=for comment
```

```
#####
```

```
=head2 Writing Polite Robots
```

If you want to make sure that your LWP-based program respects [F<robots.txt>](#) files and doesn't make too many requests too fast, you can use the `LWP::RobotUA` class instead of the `LWP::UserAgent` class.

`LWP::RobotUA` class is just like `LWP::UserAgent`, and you can use it like so:

```
use LWP::RobotUA;  
my $browser = LWP::RobotUA->new('YourSuperBot/1.34', 'you@yoursite.com');  
# Your bot's name and your email address  
  
my $response = $browser->get($url);
```

But `LWP::RobotUA` adds these features:

=over

=item \*

If the F<robots.txt> on C<\$url>'s server forbids you from accessing C<\$url>, then the C<\$browser> object (assuming it's of class LWP::RobotUA) won't actually request it, but instead will give you back (in C<\$response>) a 403 error with a message "Forbidden by robots.txt". That is, if you have this line:

```
die "$url -- ", $response->status_line, "\nAborted"
unless $response->is_success;
```

then the program would die with an error message like this:

```
http://whatever.site.int/pith/x.html -- 403 Forbidden by robots.txt
Aborted at whateverprogram.pl line 1234
```

=item \*

If this C<\$browser> object sees that the last time it talked to C<\$url>'s server was too recently, then it will pause (via C<sleep>) to avoid making too many requests too often. How long it will pause for, is by default one minute -- but you can control it with the C<<\$browser->delay( I<minutes> ) >> attribute.

For example, this code:

```
$browser->delay( 7/60 );
```

...means that this browser will pause when it needs to avoid talking to any given server more than once every 7 seconds.

=back

For more options and information, see L<the full documentation for LWP::RobotUA|LWP::RobotUA>.

=for comment

#####

=head2 Using Proxies

In some cases, you will want to (or will have to) use proxies for accessing certain sites and/or using certain protocols. This is most commonly the case when your LWP program is running (or could be running) on a machine that is behind a firewall.

To make a browser object use proxies that are defined in the usual environment variables (C<HTTP\_PROXY>, etc.), just call the C<env\_proxy> on a user-agent object before you go making any requests on it.

Specifically:

```
use LWP::UserAgent;
my $browser = LWP::UserAgent->new;
```

```
# And before you go making any requests:
$browser->env_proxy;
```

For more information on proxy parameters, see L<the LWP::UserAgent documentation|LWP::UserAgent>, specifically the C<proxy>, C<env\_proxy>, and C<no\_proxy> methods.

=for comment

```
#####
```

=head2 HTTP Authentication

Many web sites restrict access to documents by using "HTTP Authentication". This isn't just any form of "enter your password" restriction, but is a specific mechanism where the HTTP server sends the browser an HTTP code that says "That document is part of a protected 'realm', and you can access it only if you re-request it and add some special authorization headers to your request".

For example, the Unicode.org admins stop email-harvesting bots from harvesting the contents of their mailing list archives, by protecting them with HTTP Authentication, and then publicly stating the username and password (at C<<http://www.unicode.org/mail-arch/>>) -- namely username "unicode-ml" and password "unicode".

For example, consider this URL, which is part of the protected area of the web site:

```
http://www.unicode.org/mail-arch/unicode-ml/y2002-m08/0067.html
```

If you access that with a browser, you'll get a prompt like

"Enter username and password for 'Unicode-MailList-Archives' at server 'www.unicode.org'".

In LWP, if you just request that URL, like this:

```
use LWP;
my $browser = LWP::UserAgent->new;

my $url =
'http://www.unicode.org/mail-arch/unicode-ml/y2002-m08/0067.html';
my $response = $browser->get($url);

die "Error: ", $response->header('WWW-Authenticate') || 'Error accessing',
# ('WWW-Authenticate' is the realm-name)
"\n ", $response->status_line, "\n at $url\n Aborting"
unless $response->is_success;
```

Then you'll get this error:

```
Error: Basic realm="Unicode-MailList-Archives"
401 Authorization Required
at http://www.unicode.org/mail-arch/unicode-ml/y2002-m08/0067.html
Aborting at auth1.pl line 9. [or wherever]
```

..because the C<\$browser> doesn't know any the username and password for that realm ("Unicode-MailList-Archives") at that host ("www.unicode.org"). The simplest way to let the browser know about this is to use the C<credentials> method to let it know about a username and password that it can try using for that realm at that host. The syntax is:

```
$browser->credentials(
'servername:portnumber',
'realm-name',
'username' => 'password'
);
```

In most cases, the port number is 80, the default TCP/IP port for HTTP; and you usually call the C<credentials> method before you make any requests. For example:

```
$browser->credentials(
'reports.mybazouki.com:80',
'web_server_usage_reports',
'plinky' => 'banjo123'
);
```

So if we add the following to the program above, right after the C<<

```
$browser = LWP::UserAgent->new; >> line...
```

```
$browser->credentials( # add this to our $browser 's "key ring"
'www.unicode.org:80',
'Unicode-MailList-Archives',
'unicode-ml' => 'unicode'
);
```

...then when we run it, the request succeeds, instead of causing the C<die> to be called.

```
=for comment
```

```
#####
```

```
=head2 Accessing HTTPS URLs
```

When you access an HTTPS URL, it'll work for you just like an HTTP URL would -- if your LWP installation has HTTPS support (via an appropriate Secure Sockets Layer library). For example:

```
use LWP;
my $url = 'https://www.paypal.com/'; # Yes, HTTPS!
my $browser = LWP::UserAgent->new;
my $response = $browser->get($url);
die "Error at $url\n ", $response->status_line, "\n Aborting"
unless $response->is_success;
print "Whee, it worked! I got that ",
$response->content_type, " document!\n";
```

If your LWP installation doesn't have HTTPS support set up, then the response will be unsuccessful, and you'll get this error message:

```
Error at https://www.paypal.com/
501 Protocol scheme 'https' is not supported
Aborting at paypal.pl line 7. [or whatever program and line]
```

If your LWP installation I<does> have HTTPS support installed, then the response should be successful, and you should be able to consult C<\$response> just like with any normal HTTP response.

For information about installing HTTPS support for your LWP installation, see the helpful F<README.SSL> file that comes in the libwww-perl distribution.

=for comment

#####

## =head2 Getting Large Documents

When you're requesting a large (or at least potentially large) document, a problem with the normal way of using the request methods (like `C<< $response = $browser->get($url) >>`) is that the response object in memory will have to hold the whole document -- `I<in memory>`. If the response is a thirty megabyte file, this is likely to be quite an imposition on this process's memory usage.

A notable alternative is to have LWP save the content to a file on disk, instead of saving it up in memory. This is the syntax to use:

```
$response = $ua->get($url,  
    ':content_file' => $filespec,  
  
    );
```

For example,

```
$response = $ua->get('http://search.cpan.org/',  
    ':content_file' => '/tmp/sco.html'  
    );
```

When you use this `C<:content_file>` option, the `C<$response>` will have all the normal header lines, but `C<< $response->content >>` will be empty.

Note that this `":content_file"` option isn't supported under older versions of LWP, so you should consider adding `C<use LWP 5.66;>` to check the LWP version, if you think your program might run on systems with older versions.

If you need to be compatible with older LWP versions, then use this syntax, which does the same thing:

```
use HTTP::Request::Common;  
$response = $ua->request( GET($url), $filespec );
```

=for comment

=head1 NAME

lwp-request, GET, POST, HEAD - Simple command line user agent

## =head1 SYNOPSIS

```
B<lwp-request> [B<-afPuUsSedvhx>] [B<-m> I<method>] [B<-b> I<base URL>] [B<-t> I<timeout>]
  [B<-i> I<if-modified-since>] [B<-c> I<content-type>]
  [B<-C> I<credentials>] [B<-p> I<proxy-url>] [B<-o> I<format>] I<url>...
```

## =head1 DESCRIPTION

This program can be used to send requests to WWW servers and your local file system. The request content for POST and PUT methods is read from stdin. The content of the response is printed on stdout. Error messages are printed on stderr. The program returns a status value indicating the number of URLs that failed.

The options are:

=over 4

=item -m <method>

Set which method to use for the request. If this option is not used, then the method is derived from the name of the program.

=item -f

Force request through, even if the program believes that the method is illegal.

The server might reject the request eventually.

=item -b <uri>

This URI will be used as the base URI for resolving all relative URIs given as argument.

=item -t <timeout>

Set the timeout value for the requests. The timeout is the amount of time that the program will wait for a response from the remote server before it fails. The default unit for the timeout value is seconds. You might append "m" or "h" to the timeout value to make it minutes or hours, respectively. The default timeout is '3m', i.e. 3 minutes.

=item -i <time>

Set the If-Modified-Since header in the request. If I<time> is the name of a file, use the modification timestamp for this file. If I<time> is not a file, it is parsed as a literal date. Take a look at

L<HTTP::Date> for recognized formats.

=item -c <content-type>

Set the Content-Type for the request. This option is only allowed for requests that take a content, i.e. POST and PUT. You can force methods to take content by using the C<-f> option together with C<-c>. The default Content-Type for POST is C<application/x-www-form-urlencoded>. The default Content-type for the others is C<text/plain>.

=item -p <proxy-url>

Set the proxy to be used for the requests. The program also loads proxy settings from the environment. You can disable this with the C<-P> option.

=item -P

Don't load proxy settings from environment.

=item -H <header>

Send this HTTP header with each request. You can specify several, e.g.:

```
lwp-request \  
-H 'Referer: http://other.url/' \  
-H 'Host: somehost' \  
http://this.url/
```

=item -C <username>:<password>

Provide credentials for documents that are protected by Basic Authentication. If the document is protected and you did not specify the username and password with this option, then you will be prompted to provide these values.

=back

The following options controls what is displayed by the program:

=over 4

=item -u

Print request method and absolute URL as requests are made.

=item -U

Print

request headers in addition to request method and absolute URL.

=item -s

Print response status code. This option is always on for HEAD requests.

=item -S

Print response status chain. This shows redirect and authorization requests that are handled by the library.

=item -e

Print response headers. This option is always on for HEAD requests.

=item -E

Print response status chain with full response headers.

=item -d

Do B<not> print the content of the response.

=item -o <format>

Process HTML content in various ways before printing it. If the content type of the response is not HTML, then this option has no effect. The legal format values are; I<text>, I<ps>, I<links>, I<html> and I<dump>.

If you specify the I<text> format then the HTML will be formatted as plain latin1 text. If you specify the I<ps> format then it will be formatted as Postscript.

The I<links> format will output all links found in the HTML document. Relative links will be expanded to absolute ones.

The I<html>

format will reformat the HTML code and the I<dump> format will just dump the HTML syntax tree.

Note that the C<HTML-Tree> distribution needs to be installed for this option to work. In addition the C<HTML-Format> distribution needs to be installed for I<-o text> or I<-o ps> to work.

=item -v

Print the version number of the program and quit.

=item -h

Print usage message and quit.

=item -a

Set text(ascii) mode for content input and output. If this option is not used, content input and output is done in binary mode.

=back

Because this program is implemented using the LWP library, it will only support the protocols that LWP supports.

=head1 NAME

LWP::UserAgent - Web user agent class

=head1 SYNOPSIS

require LWP::UserAgent;

```

my $ua = LWP::UserAgent->new;
$ua->timeout(10);
$ua->env_proxy;

my $response = $ua->get('http://search.cpan.org/');

if ($response->is_success) {
    print $response->decoded_content; # or whatever
}
else {
    die $response->status_line;
}

```

#### =head1 DESCRIPTION

The C<LWP::UserAgent> is a class implementing a web user agent. C<LWP::UserAgent> objects can be used to dispatch web requests.

In normal use the application creates an C<LWP::UserAgent> object, and then configures it with values for timeouts, proxies, name, etc. It then creates an instance of C<HTTP::Request> for the request that needs to be performed. This request is then passed to one of the request method the UserAgent, which dispatches it using the relevant protocol, and returns a C<HTTP::Response> object. There are convenience methods for sending the most common request types: get(), head(), post(), put() and delete(). When using these methods then the creation of the request object is hidden as shown in the synopsis above.

The basic approach of the library is to use HTTP style communication for all protocol schemes. This means that you will construct C<HTTP::Request> objects and receive C<HTTP::Response> objects even for non-HTTP resources like I<gopher> and I<ftp>. In order to achieve even more similarity to HTTP style communications, gopher menus and file directories are converted to HTML documents.

#### =head1 CONSTRUCTOR METHODS

The following constructor methods are available:

=over 4

```
=item $ua = LWP::UserAgent->new( %options )
```

This method constructs a new C<LWP::UserAgent> object and returns it. Key/value pair arguments may be provided to set up the initial state. The following options correspond to attribute methods described below:

| KEY                   | DEFAULT                  |
|-----------------------|--------------------------|
| agent                 | "libwww-perl/#.###"      |
| from                  | undef                    |
| conn_cache            | undef                    |
| cookie_jar            | undef                    |
| default_headers       | HTTP::Headers->new       |
| local_address         | undef                    |
| ssl_opts              | { verify_hostname => 1 } |
| max_size              | undef                    |
| max_redirect          | 7                        |
| parse_head            | 1                        |
| protocols_allowed     | undef                    |
| protocols_forbidden   | undef                    |
| requests_redirectable | ['GET', 'HEAD']          |
| timeout               | 180                      |

The following additional options are also accepted: If the C<env\_proxy> option is passed in with a TRUE value, then proxy settings are read from environment variables (see env\_proxy() method below). If C<env\_proxy> isn't provided the C<PERL\_LWP\_ENV\_PROXY> environment variable controls if env\_proxy() is called during initialization. If the C<keep\_alive> option is passed in, then a C<LWP::ConnCache> is set up (see conn\_cache() method below). The C<keep\_alive> value is passed on as the C<total\_capacity> for the connection cache.

=item \$ua->clone

Returns a copy of the LWP::UserAgent object.

=back

=head1 ATTRIBUTES

The settings of the configuration attributes modify the behaviour of the C<LWP::UserAgent> when it dispatches requests. Most of these can also be initialized by options passed to the constructor method.

The following attribute methods are provided. The attribute value is left unchanged if no argument is given. The return value from each method is the old attribute value.

=over

=item \$ua->agent

=item \$ua->agent( \$product\_id )

Get/set the product token that is used to identify the user agent on the network. The agent value is sent as the "User-Agent" header in the requests. The default is the string returned by the `_agent()` method (see below).

If the `$product_id` ends with space then the `_agent()` string is appended to it.

The user agent string should be one or more simple product identifiers with an optional version number separated by the "/" character.

Examples

are:

```
$ua->agent('Checkbot/0.4 ' . $ua->_agent);
$ua->agent('Checkbot/0.4 '); # same as above
$ua->agent('Mozilla/5.0');
$ua->agent(''); # don't identify
```

=item `$ua->_agent`

Returns the default agent identifier. This is a string of the form "libwww-perl/#.###", where "#.###" is substituted with the version number of this library.

=item `$ua->from`

=item `$ua->from( $email_address )`

Get/set the e-mail address for the human user who controls the requesting user agent. The address should be machine-usable, as defined in RFC 822. The C<from> value is sent as the "From" header in the requests. Example:

```
$ua->from('gaas@cpan.org');
```

The default is to not send a "From" header. See the `default_headers()` method for the more general interface that allow any header to be defaulted.

=item `$ua->cookie_jar`

=item `$ua->cookie_jar( $cookie_jar_obj )`

Get/set the cookie jar object to use. The only requirement is that the cookie jar object must implement the `extract_cookies($request)` and `add_cookie_header($response)` methods. These methods will then be invoked by the user agent as requests are sent and responses are received. Normally this will be a C<HTTP::Cookies> object or some

subclass.

The default is to have no `cookie_jar`, i.e. never automatically add "Cookie" headers to the requests.

Shortcut: If a reference to a plain hash is passed in as the `$cookie_jar_object`, then it is replaced with an instance of `C<HTTP::Cookies>` that is initialized based on the hash. This form also automatically loads the `C<HTTP::Cookies>` module. It means that:

```
$ua->cookie_jar({ file => "$ENV{HOME}/.cookies.txt" });
```

is really just a shortcut for:

```
require HTTP::Cookies;
$ua->cookie_jar(HTTP::Cookies->new(file => "$ENV{HOME}/.cookies.txt"));
```

```
=item $ua->default_headers
```

```
=item $ua->default_headers( $headers_obj )
```

Get/set the headers object that will provide default header values for any requests sent. By default this will be an empty `C<HTTP::Headers>` object.

```
=item
$ua->default_header( $field )
```

```
=item $ua->default_header( $field => $value )
```

This is just a short-cut for `$ua->default_headers->header( $field => $value )`. Example:

```
$ua->default_header('Accept-Encoding' => scalar HTTP::Message::decodable());
$ua->default_header('Accept-Language' => "no, en");
```

```
=item $ua->conn_cache
```

```
=item $ua->conn_cache( $cache_obj )
```

Get/set the `C<LWP::ConnCache>` object to use. See `L<LWP::ConnCache>` for details.

```
=item $ua->credentials( $netloc, $realm )
```

```
=item $ua->credentials( $netloc, $realm, $uname, $pass )
```

Get/set the user name and password to be used for a realm.

The \$netloc is a string of the form "<host>:<port>". The username and password will only be passed to this server. Example:

```
$ua->credentials("www.example.com:80", "Some Realm", "foo", "secret");
```

```
=item $ua->local_address
```

```
=item $ua->local_address( $address )
```

Get/set the local interface to bind to for network connections. The interface can be specified as a hostname or an IP address. This value is passed as the C<LocalAddr> argument to L<IO::Socket::INET>.

```
=item $ua->max_size
```

```
=item $ua->max_size( $bytes )
```

Get/set the size limit for response content. The default is C<undef>, which means that there is no limit. If the returned response content is only partial, because the size limit was exceeded, then a "Client-Aborted" header will be added to the response. The content might end up longer than C<max\_size> as we abort once appending a chunk of data makes the length exceed the limit. The "Content-Length" header, if present, will indicate the length of the full content and will normally not be the same as C<< length(\$res->content) >>.

```
=item $ua->max_redirect
```

```
=item $ua->max_redirect( $n )
```

This reads or sets the object's limit of how many times it will obey redirection responses in a given request cycle.

By default, the value is 7. This means that if you call request() method and the response is a redirect elsewhere which is in turn a redirect, and so on seven times, then LWP gives up after that seventh request.

```
=item $ua->parse_head
```

```
=item $ua->parse_head( $boolean )
```

Get/set a value indicating whether we should initialize response headers from the E<lt>head> section of HTML documents. The default is TRUE. Do not turn this off, unless you know what you are doing.

=item \$ua->protocols\_allowed

=item \$ua->protocols\_allowed( \@protocols )

This reads (or sets) this user agent's list of protocols that the request methods will exclusively allow. The protocol names are case insensitive.

For example: `C<$ua-E<gt>protocols_allowed( [ 'http', 'https' ] );>` means that this user agent will I<allow only> those protocols, and attempts to use this user agent to access URLs with any other schemes (like "ftp://...") will result in a 500 error.

To delete the list, call: `C<$ua-E<gt>protocols_allowed(undef)>`

By default, an object has neither a `C<protocols_allowed>` list, nor a `C<protocols_forbidden>` list.

Note that having a `C<protocols_allowed>` list causes any `C<protocols_forbidden>` list to be ignored.

=item \$ua->protocols\_forbidden

=item \$ua->protocols\_forbidden( \@protocols )

This reads (or sets) this user agent's list of protocols that the request method will I<not> allow. The protocol names are case insensitive.

For example: `C<$ua-E<gt>protocols_forbidden( [ 'file', 'mailto' ] );>` means that this user agent will I<not> allow those protocols, and attempts to use this user agent to access URLs with those schemes will result in a 500 error.

To delete the list, call: `C<$ua-E<gt>protocols_forbidden(undef)>`

=item \$ua->requests\_redirectable

=item \$ua->requests\_redirectable( \@requests )

This reads or sets the object's list of request names that `C<$ua-E<gt>redirect_ok(...)>` will allow redirection for. By default, this is `C<['GET', 'HEAD']>`, as per RFC 2616. To change to include 'POST', consider:

```
push @ { $ua->requests_redirectable }, 'POST';
```

=item \$ua->show\_progress

=item \$ua->show\_progress( \$boolean )

Get/set

a value indicating whether a progress bar should be displayed on the terminal as requests are processed. The default is FALSE.

=item \$ua->timeout

=item \$ua->timeout( \$secs )

Get/set the timeout value in seconds. The default timeout() value is 180 seconds, i.e. 3 minutes.

The request is aborted if no activity on the connection to the server is observed for C<timeout> seconds. This means that the time it takes for the complete transaction and the request() method to actually return might be longer.

=item \$ua->ssl\_opts

=item \$ua->ssl\_opts( \$key )

=item \$ua->ssl\_opts( \$key => \$value )

Get/set the options for SSL connections. Without argument return the list of options keys currently set. With a single argument return the current value for the given option. With 2 arguments set the option value and return the old. Setting an option to the value C<undef> removes this option.

The options that LWP relates to are:

=over

=item C<verify\_hostname> => \$bool

When TRUE LWP

will for secure protocol schemes ensure it connects to servers that have a valid certificate matching the expected hostname. If FALSE no checks are made and you can't be sure that you communicate with the expected peer. The no checks behaviour was the default for libwww-perl-5.837 and earlier releases.

This option is initialized from the L<PERL\_LWP\_SSL\_VERIFY\_HOSTNAME> environment variable. If this environment variable isn't set; then C<verify\_hostname> defaults to 1.

=item C<SSL\_ca\_file> => \$path

The path to a file containing Certificate Authority certificates.

A default setting for this option is provided by checking the environment variables C<PERL\_LWP\_SSL\_CA\_FILE> and C<HTTPS\_CA\_FILE> in order.

=item C<SSL\_ca\_path> => \$path

The path to a directory containing files containing Certificate Authority certificates.

A default setting for this option is provided by checking the environment variables C<PERL\_LWP\_SSL\_CA\_PATH> and C<HTTPS\_CA\_DIR> in order.

=back

Other options can be

set and are processed directly by the SSL Socket implementation in use. See L<IO::Socket::SSL> or L<Net::SSL> for details.

The libwww-perl core no longer bundles protocol plugins for SSL. You will need to install L<LWP::Protocol::https> separately to enable support for processing https-URLs.

=back

=head2 Proxy attributes

The following methods set up when requests should be passed via a proxy server.

=over

=item \$ua->proxy(\@schemes, \$proxy\_url)

=item \$ua->proxy(\$scheme, \$proxy\_url)

Set/retrieve proxy URL for a scheme:

```
$ua->proxy(['http', 'ftp'], 'http://proxy.sn.no:8001/');  
$ua->proxy('gopher', 'http://proxy.sn.no:8001/');
```

The first form specifies that the URL is to be used for proxying of access methods listed in the list in the first method argument, i.e. 'http' and 'ftp'.

The second form shows a shorthand form for specifying proxy URL for a single access scheme.

=item \$ua->no\_proxy( \$domain, ... )

Do not proxy requests to the given domains. Calling no\_proxy without any domains clears the list of domains. Eg:

```
$ua->no_proxy('localhost', 'example.com');
```

=item \$ua->env\_proxy

Load proxy settings from \*\_proxy environment variables. You might specify proxies like this (sh-syntax):

```
gopher_proxy=http://proxy.my.place/  
wais_proxy=http://proxy.my.place/  
no_proxy="localhost,example.com"  
export gopher_proxy wais_proxy no_proxy
```

csh or tcsh users should use the C<setenv> command to define these environment variables.

On systems with case insensitive environment variables there exists a name clash between the CGI environment variables and the C<HTTP\_PROXY> environment variable normally picked up by env\_proxy(). Because of this C<HTTP\_PROXY> is not honored for CGI scripts. The C<CGI\_HTTP\_PROXY> environment variable can be used instead.

=back

=head2 Handlers

Handlers are code that injected at various phases during the processing of requests. The following methods are provided to manage the active handlers:

=over

```
=item $ua->add_handler( $phase  
=> \&cb, %matchspec )
```

Add handler to be invoked in the given processing phase. For how to specify %matchspec see L<HTTP::Config/"Matching">.

The possible values \$phase and the corresponding callback signatures are:

=over

```
=item request_preprepare => sub { my($request, $ua, $h) = @_; ... }
```

The handler is called before the C<request\_prepare> and other standard initialization of the request. This can be used to set up headers and attributes that the C<request\_prepare> handler depends on. Proxy initialization should take place here; but in general don't register handlers for this phase.

```
=item request_prepare => sub { my($request, $ua, $h) = @_; ... }
```

The handler is called before the request is sent and can modify the request any way it see fit. This can for instance be used to add certain headers to specific requests.

The method can assign a new request object to \$\_[0] to replace the request that is sent fully.

The return value from the callback is ignored. If an exception is raised it will abort the request and make the request method return a "400 Bad request" response.

```
=item request_send => sub { my($request, $ua, $h) = @_; ... }
```

This handler gets a chance of handling requests before they're sent to the protocol handlers. It should return an HTTP::Response object if it wishes to terminate the processing; otherwise it should return nothing.

The C<response\_header> and C<response\_data> handlers will not be invoked for this response, but the C<response\_done> will be.

```
=item response_header => sub { my($response, $ua, $h) = @_; ... }
```

This handler is called right after the response headers have been received, but before any content data. The handler might set up handlers for data and might croak to abort the request.

The handler might set the \$response->{default\_add\_content} value to control if any received data should be added to the response object directly. This will initially be false if the \$ua->request() method was called with a \$content\_file or \$content\_cb argument; otherwise true.

```
=item response_data => sub { my($response, $ua, $h, $data) = @_; ... }
```

This handler is called for each chunk of data received for the response. The handler might croak to abort the request.

This handler needs to return a TRUE value to be called again for

subsequent chunks for the same request.

```
=item response_done => sub { my($response, $ua, $h) = @_; ... }
```

The handler is called after the response has been fully received, but before any redirect handling is attempted. The handler can be used to extract information or modify the response.

```
=item response_redirect => sub { my($response, $ua, $h) = @_; ... }
```

The handler is called in `$ua->request` after `C<response_done>`. If the handler returns an `HTTP::Request` object we'll start over with processing this request instead.

```
=back
```

```
=item $ua->remove_handler( undef, %matchspec )
```

```
=item $ua->remove_handler( $phase, %matchspec )
```

Remove handlers that match the given `%matchspec`. If `$phase` is not provided remove handlers from all phases.

Be careful as calling this function with `%matchspec` that is not specific enough can remove handlers not owned by you. It's probably better to use the `set_my_handler()` method instead.

The removed handlers are returned.

```
=item $ua->set_my_handler( $phase, $cb, %matchspec )
```

Set handlers private to the executing subroutine. Works by defaulting an `C<owner>` field to the `%matchspec` that holds the name of the called subroutine. You might pass an explicit `C<owner>` to override this.

If `$cb` is passed as `C<undef>`, remove the handler.

```
=item $ua->get_my_handler( $phase, %matchspec )
```

```
=item $ua->get_my_handler( $phase, %matchspec, $init )
```

Will retrieve the matching handler as hash ref.

If `C<$init>` is passed as a `TRUE` value, create and add the handler if it's not found. If `$init` is a subroutine reference, then it's called with the created handler hash as argument. This sub might populate the hash with extra fields; especially the callback.

If

\$init is a hash reference, merge the hashes.

```
=item $ua->handlers( $phase, $request )
```

```
=item $ua->handlers( $phase, $response )
```

Returns the handlers that apply to the given request or response at the given processing phase.

```
=back
```

```
=head1 REQUEST METHODS
```

The methods described in this section are used to dispatch requests via the user agent. The following request methods are provided:

```
=over
```

```
=item $ua->get( $url )
```

```
=item $ua->get( $url , $field_name => $value, ... )
```

This method will dispatch a C<GET> request on the given \$url. Further arguments can be given to initialize the headers of the request. These are given as separate name/value pairs. The return value is a response object. See L<HTTP::Response> for a description of the interface it provides.

There will still be a response object returned when LWP can't connect to the server specified in the URL or when other failures in protocol handlers occur. These internal responses use the standard HTTP status codes, so the responses can't be differentiated by testing the response status code alone. Error responses that LWP generates internally will have the "Client-Warning" header set to the value "Internal response". If you need to differentiate these internal responses from responses that a remote server actually generates, you need to test this header value.

Fields names that start with ":" are special. These will not initialize headers of the request but will determine how the response content is treated. The following special field names are recognized:

```
:content_file => $filename  
:content_cb   => \&callback  
:read_size_hint => $bytes
```

If a \$filename is provided with the C<:content\_file> option, then the

response content will be saved here instead of in the response object. If a callback is provided with the C<:content\_cb> option then this function will be called for each chunk of the response content as it is received from the server. If neither of these options are given, then

the response content will accumulate in the response object itself. This might not be suitable for very large response bodies. Only one of C<:content\_file> or C<:content\_cb> can be specified. The content of unsuccessful responses will always accumulate in the response object itself, regardless of the C<:content\_file> or C<:content\_cb> options passed in.

The C<:read\_size\_hint> option is passed to the protocol module which will try to read data from the server in chunks of this size. A smaller value for the C<:read\_size\_hint> will result in a higher number of callback invocations.

The callback function is called with 3 arguments: a chunk of data, a reference to the response object, and a reference to the protocol object. The callback can abort the request by invoking die(). The exception message will show up as the "X-Died" header field in the response returned by the get() function.

```
=item $ua->head( $url )
```

```
=item $ua->head( $url , $field_name => $value, ... )
```

This method will

dispatch a C<HEAD> request on the given \$url.

Otherwise it works like the get() method described above.

```
=item $ua->post( $url, \%form )
```

```
=item $ua->post( $url, \@form )
```

```
=item $ua->post( $url, \%form, $field_name => $value, ... )
```

```
=item $ua->post( $url, $field_name => $value,... Content => \%form )
```

```
=item $ua->post( $url, $field_name => $value,... Content => \@form )
```

```
=item $ua->post( $url, $field_name => $value,... Content => $content )
```

This method will dispatch a C<POST> request on the given \$url, with %form or @form providing the key/value pairs for the fill-in form content. Additional headers and content options are the same as for the get() method.

This method will use the POST() function from C<HTTP::Request::Common> to build the request. See L<HTTP::Request::Common> for a details on how to pass form content and other advanced features.

```
=item $ua->put( $url, \%form )
```

```
=item $ua->put( $url, \@form )
```

```
=item $ua->put( $url, \%form, $field_name => $value, ... )
```

```
=item $ua->put(
    $url, $field_name => $value,... Content => \%form )
```

```
=item $ua->put( $url, $field_name => $value,... Content => \@form )
```

```
=item $ua->put( $url, $field_name => $value,... Content => $content )
```

This method will dispatch a C<PUT> request on the given \$url, with %form or @form providing the key/value pairs for the fill-in form content. Additional headers and content options are the same as for the get() method.

This method will use the PUT() function from C<HTTP::Request::Common> to build the request. See L<HTTP::Request::Common> for a details on how to pass form content and other advanced features.

```
=item $ua->delete( $url )
```

```
=item $ua->delete( $url, $field_name => $value, ... )
```

This method will dispatch a C<DELETE> request on the given \$url. Additional headers and content options are the same as for the get() method.

This method will use the DELETE() function from C<HTTP::Request::Common> to build the request. See L<HTTP::Request::Common> for a details on how to pass form content and other advanced features.

```
=item $ua->mirror( $url, $filename )
```

This method will get the document identified by \$url and store it in file called \$filename. If the file already exists, then the request will contain an "If-Modified-Since" header matching the modification time of the file. If the document on the server has not changed since this time, then nothing happens. If the document has been updated, it will be downloaded again. The modification time of the file will be forced to match that of the server.

The return value is the the response object.

```
=item $ua->request( $request )
```

```
=item $ua->request( $request, $content_file )
```

```
=item $ua->request( $request, $content_cb )
```

```
=item $ua->request( $request, $content_cb, $read_size_hint )
```

This method will dispatch the given `$request` object. Normally this will be an instance of the `C<HTTP::Request>` class, but any object with a similar interface will do. The return value is a response object.

See `L<HTTP::Request>` and `L<HTTP::Response>`

for a description of the interface provided by these classes.

The `request()` method will process redirects and authentication responses transparently. This means that it may actually send several simple requests via the `simple_request()` method described below.

The request methods described above; `get()`, `head()`, `post()` and `mirror()`, will all dispatch the request they build via this method. They are convenience methods that simply hides the creation of the request object for you.

The `$content_file`, `$content_cb` and `$read_size_hint` all correspond to options described with the `get()` method above.

You are allowed to use a CODE reference as `C<content>` in the request object passed in. The `C<content>` function should return the content when called. The content can be returned in chunks. The content function will be invoked repeatedly until it return an empty string to signal that there is no more content.

```
=item $ua->simple_request( $request )
```

```
=item $ua->simple_request( $request,  
    $content_file )
```

```
=item $ua->simple_request( $request, $content_cb )
```

```
=item $ua->simple_request( $request, $content_cb, $read_size_hint )
```

This method dispatches a single request and returns the response received. Arguments are the same as for `request()` described above.

The difference from `request()` is that `simple_request()` will not try to

handle redirects or authentication responses. The request() method will in fact invoke this method for each simple request it sends.

=item \$ua->is\_online

Tries to determine if you have access to the Internet. Returns TRUE if the built-in heuristics determine that the user agent is able to access the Internet (over HTTP). See also L<LWP::Online>.

=item \$ua->is\_protocol\_supported( \$scheme )

You can use this method to test whether this user agent object supports the specified C<scheme>. (The C<scheme> might be a string (like 'http' or 'ftp') or it might be an URI object reference.)

Whether a scheme is supported, is determined by the user agent's C<protocols\_allowed> or C<protocols\_forbidden> lists (if any), and by the capabilities of LWP. I.e., this will return TRUE only if LWP supports this protocol I<and> it's permitted for this particular object.

=back

=head2 Callback methods

The following methods will be invoked as requests are processed. These methods are documented here because subclasses of C<LWP::UserAgent> might want to override their behaviour.

=over

=item \$ua->prepare\_request( \$request )

This method is invoked by simple\_request(). Its task is to modify the given \$request object by setting up various headers based on the attributes of the user agent. The return value should normally be the \$request object passed in. If a different request object is returned it will be the one actually processed.

The headers affected by the base implementation are; "User-Agent", "From", "Range" and "Cookie".

=item \$ua->redirect\_ok( \$prospective\_request, \$response )

This method is called by request() before it tries to follow a redirection to the request in \$response. This should return a TRUE

value if this redirection is permissible. The `$prospective_request` will be the request to be sent if this method returns TRUE.

The base implementation will return FALSE unless the method is in the object's `C<requests_redirectable>` list, FALSE if the proposed redirection is to a "file://..." URL, and TRUE otherwise.

```
=item $ua->get_basic_credentials( $realm, $uri, $isproxy )
```

This is called by `request()` to retrieve credentials for documents protected by Basic or Digest Authentication. The arguments passed in is the `$realm` provided by the server, the `$uri` requested and a boolean flag to indicate if this is authentication against a proxy server.

The method should return a username and password. It should return an empty list to abort the authentication resolution attempt. Subclasses can override this method to prompt the user for the information. An example of this can be found in `C<lwp-request>` program distributed with this library.

The base implementation simply checks a set of pre-stored member variables, set up with the `credentials()` method.

```
=item $ua->progress( $status, $request_or_response )
```

This is called frequently as the response is received regardless of how the content is processed. The method is called with `$status` "begin" at the start of processing the request and with `$state` "end" before the request method returns. In between these `$status` will be the fraction of the response currently received or the string "tick" if the fraction can't be calculated.

When `$status` is "begin" the second argument is the request object, otherwise it is the response object.

```

README for HTML::Tagset

HTML::Tagset

This module contains data tables useful in dealing with HTML.

It provides no functions or methods.

PREREQUISITES

This suite requires Perl 5.

HTML::Tagset doesn't use any nonstandard modules.

INSTALLATION

You install HTML::Tagset, as you would install any perl module library, by running these commands:

```
perl Makefile.PL
make
make test
make install
```

If you want to install a private copy of HTML::Tagset in your home directory, then you should try to produce the initial Makefile with something like this command:

```
perl Makefile.PL LIB=~/.perl
```

## DOCUMENTATION

POD-format documentation is included in Tagset.pm. POD is readable with the 'perldoc' utility. See ChangeLog for recent changes.

## MACPERL INSTALLATION NOTES

Don't bother with the makefiles. Just make a HTML directory in your MacPerl site\_lib or lib directory, and move Tagset.pm into there.

## SUPPORT

Questions, bug reports, and suggestions for HTML::Tagset should just be sent to me at [sburke@cpan.org](mailto:sburke@cpan.org)

## AVAILABILITY

The latest version of HTML::Tagset is available from the Comprehensive Perl Archive Network (CPAN). Visit <http://www.perl.com/CPAN/> to find a CPAN site near you.

```

=head1 CAVEATS

You may find it useful to alter the behavior of modules (like C<HTML::Element> or C<HTML::TreeBuilder>) that use C<HTML::Tagset>'s data tables by altering the data tables themselves. You are welcome to try, but be careful; and be aware that different modules may or may react differently to the data tables being changed.

Note that it may be inappropriate to use these tables for I<producing> HTML -- for example, C<%isHeadOrBodyElement> lists the tagnames for all elements that can appear either in the head or in the body, such as "script". That doesn't mean that I am saying your code that produces HTML should feel free to put script elements in either place! If you are producing programs that spit out HTML, you should be I<intimately> familiar with the DTDs for HTML or XHTML (available at C<<http://www.w3.org/>>), and you should slavishly obey them, not the data tables in this document.

## 1.527.1 Available under license :

No license file was found, but licenses were detected in source scan.

=head1 EXIT CODES

If all your tests passed, Test::Builder will exit with zero (which is normal). If anything failed it will exit with how many failed. If you run less (or more) tests than you planned, the missing (or extras) will be considered failures. If no tests were ever run Test::Builder will throw a warning and exit with 255. If the test died, even after having successfully completed all its tests, it will still be considered a failure and will exit with 255.

So the exit codes are...

|                  |   |
|------------------|---|
| 0                | all tests successful                          |
| 255              | test died                                     |
| any other number | how many failed (including missing or extras) |

If you fail more than 254 tests, it will be reported as 254.

=head1 THREADS

In perl 5.8.0 and later, Test::Builder is thread-safe. The test number is shared amongst all threads. This means if one thread sets the test number using current\_test() they will all be effected.

Test::Builder

is only thread-aware if threads.pm is loaded I<before>

Test::Builder.

=head1 EXAMPLES

CPAN can provide the best examples. Test::Simple, Test::More, Test::Exception and Test::Differences all use Test::Builder.

=back

Test::Simple will start by printing number of tests run in the form "1..M" (so "1..5" means you're going to run 5 tests). This strange format lets Test::Harness know how many tests you plan on running in case something goes horribly wrong.

If all your tests passed, Test::Simple will exit with zero (which is normal). If anything failed it will exit with how many failed. If you run less (or more) tests than you planned, the missing (or extras) will be considered failures. If no tests were ever run Test::Simple will throw a warning and exit with 255. If the test died, even after having successfully completed all its tests, it will still be considered a failure and will exit with 255.

So the exit codes are...

|                  |   |
|------------------|---|
| 0                | all tests successful                          |
| 255              | test died                                     |
| any other number | how many failed (including missing or extras) |

If you fail more than 254 tests, it will be reported as 254.

This module is by no means trying to be a complete testing system. It's just to get you started. Once you're off the ground its recommended you look at L<Test::More>.

=head1 EXAMPLE

Here's an example of a simple .t file for the fictional Film module.

```
use Test::Simple tests => 5;

use Film; # What you're testing.

my $btaste = Film->new({ Title => 'Bad Taste',
                      Director => 'Peter Jackson',
                      Rating => 'R',
                      NumExplodingSheep => 1
                      });
ok( defined($btaste) and ref $btaste eq 'Film', 'new() works' );

ok( $btaste->Title eq 'Bad Taste', 'Title() get' );
ok( $btaste->Director eq 'Peter Jackson', 'Director() get' );
```

```
ok( $btaste->Rating eq 'R', 'Rating() get' );
ok( $btaste->NumExplodingSheep == 1, 'NumExplodingSheep() get' );
```

It will produce output like this:

```
1..5
ok 1 - new() works
ok 2 - Title() get
ok 3 - Director() get
not ok 4 - Rating() get
# Failed test (t/film.t at line 14)
ok 5 - NumExplodingSheep() get
# Looks like you failed 1 tests of 5
```

Indicating the `Film::Rating()` method is broken.

=head1 CAVEATS

Test::Simple will only report a maximum of 254 failures in its exit code. If this is a problem, you probably have a huge test script. Split it into multiple files. (Otherwise blame the Unix folks for using an unsigned short integer as the exit status).

Because VMS's exit codes are much, much different than the rest of the universe, and perl does horrible mangling to them that gets in my way, it works like this on VMS.

```
0  SS$_NORMAL    all tests successful
4  SS$_ABORT     something went wrong
```

Unfortunately, I can't differentiate any further.

=head1 NOTES

Test::Simple is B<explicitly> tested all the way back to perl 5.004.

Test::Simple is thread-safe in perl 5.8.0 and up.

=head1 HISTORY

This module was conceived while talking with Tony Bowden in his kitchen one night about the problems I was having writing some really complicated feature into the new Testing module. He observed that the main problem is not dealing with these edge cases but that people hate to write tests B<at all>. What was needed was a dead simple module

that took all the hard work out of testing and was really, really easy to learn. Paul Johnson simultaneously had this idea (unfortunately, he wasn't in Tony's kitchen). This is it.

=head1 SEE ALSO

=over 4

=item L<Test::More>

More testing functions! Once you outgrow Test::Simple, look at Test::More. Test::Simple is 100% forward compatible with Test::More (i.e. you can just use Test::More instead of Test::Simple in your programs and things will still work).

=item L<Test>

The original Perl testing module.

=item L<Test::Unit>

Elaborate unit testing.

=item L<Test::Inline>, L<SelfTest>

Embed tests in your code!

=item L<Test::Harness>

Interprets  
the output of your test program.

=head1 NAME

File::Spec - portably perform operations on file names

=head1 SYNOPSIS

```
use File::Spec;
```

```
$x=File::Spec->catfile('a', 'b', 'c');
```

which returns 'a/b/c' under Unix. Or:

```
use File::Spec::Functions;
```

```
$x = catfile('a', 'b', 'c');
```

=head1 DESCRIPTION

This module is designed to support operations commonly performed on file specifications (usually called "file names", but not to be confused with the contents of a file, or Perl's file handles), such as concatenating several directory and file names into a single path, or determining whether a path is rooted. It is based on code directly taken from MakeMaker 5.17, code written by Andreas KE<ouml>nig, Andy Dougherty, Charles Bailey, Ilya Zakharevich, Paul Schinder, and others.

Since these functions are different for most operating systems, each set of OS specific routines is available in a separate module, including:

File::Spec::Unix

File::Spec::Mac

File::Spec::OS2

File::Spec::Win32

File::Spec::VMS

The

module appropriate for the current OS is automatically loaded by File::Spec. Since some modules (like VMS) make use of facilities available

only under that OS, it may not be possible to load all modules under all operating systems.

Since File::Spec is object oriented, subroutines should not be called directly, as in:

```
File::Spec::catfile('a','b');
```

but rather as class methods:

```
File::Spec->catfile('a','b');
```

For simple uses, L<File::Spec::Functions> provides convenient functional forms of these methods.

=head1 METHODS

=over 2

=item canonpath

X<canonpath>

No physical check on the filesystem, but a logical cleanup of a path.

```
$cpath = File::Spec->canonpath( $path );
```

Note that this does *not* collapse F<x/./y> sections into F<y>. This is by design. If F</foo> on your system is a symlink to F</bar/baz>, then F</foo/./quux> is actually F</bar/quux>, not F</quux> as a naive F<./>-removal would give you. If you want to do this kind of processing, you probably want C<Cwd>'s C<realpath()> function to actually traverse the filesystem cleaning up paths like this.

=item catdir

X<catdir>

Concatenate two or more directory names to form a complete path ending with a directory. But remove the trailing slash from the resulting string, because it doesn't look good, isn't necessary and confuses OS/2. Of course, if this is the root directory, don't cut off the trailing slash :-)

```
$path = File::Spec->catdir( @directories );
```

=item catfile

X<catfile>

Concatenate one or more directory names and a filename to form a complete path ending with a filename

```
$path = File::Spec->catfile( @directories, $filename );
```

```
=item curdir  
X<curdir>
```

Returns a string representation of the current directory.

```
$curdir = File::Spec->curdir();
```

```
=item devnull  
X<devnull>
```

Returns a string representation of the null device.

```
$devnull = File::Spec->devnull();
```

```
=item rootdir  
X<rootdir>
```

Returns a string representation of the root directory.

```
$rootdir = File::Spec->rootdir();
```

```
=item tmpdir  
X<tmpdir>
```

Returns a string representation of the first writable directory from a list of possible temporary directories. Returns the current directory if no writable temporary directories are found. The list of directories checked depends on the platform; e.g. File::Spec::Unix checks C<\${ENV{TMPDIR}}> (unless taint is on) and F</tmp>.

```
$tmpdir = File::Spec->tmpdir();
```

```
=item updir  
X<updir>
```

Returns a string representation of the parent directory.

```
$updir = File::Spec->updir();
```

```
=item no_upwards
```

Given a list of file names, strip out those that refer to a parent directory. (Does not strip symlinks, only '.', '..', and equivalents.)

```
@paths = File::Spec->no_upwards( @paths );
```

=item case\_tolerant

Returns a true or false value indicating, respectively, that alphabetic case is not or is significant when comparing file specifications. Cygwin and Win32 accept an optional drive argument.

```
$is_case_tolerant =  
File::Spec->case_tolerant();
```

=item file\_name\_is\_absolute

Takes as its argument a path, and returns true if it is an absolute path.

```
$is_absolute = File::Spec->file_name_is_absolute( $path );
```

This does not consult the local filesystem on Unix, Win32, OS/2, or Mac OS (Classic). It does consult the working environment for VMS (see L<File::Spec::VMS/file\_name\_is\_absolute>).

=item path

```
X<path>
```

Takes no argument. Returns the environment variable C<PATH> (or the local platform's equivalent) as a list.

```
@PATH = File::Spec->path();
```

=item join

```
X<join, path>
```

join is the same as catfile.

=item splitpath

```
X<splitpath> X<split, path>
```

Splits a path in to volume, directory, and filename portions. On systems with no concept of volume, returns "" for volume.

```
($volume,$directories,$file) =  
    File::Spec->splitpath( $path );  
($volume,$directories,$file) =  
    File::Spec->splitpath( $path, $no_file );
```

For systems with no syntax differentiating filenames from directories, assumes that the last file is a path unless C<\$no\_file> is true or a trailing separator or F</.> or F</..> is present. On Unix, this means that C<\$no\_file> true makes this return ( " , \$path, " ).

The directory portion may or may not be returned with a trailing '/'.

The results can be passed to L</catpath()> to get back a path equivalent to (usually identical to) the original path.

=item splitdir

X<splitdir> X<split, dir>

The opposite of L</catdir>.

```
@dirs = File::Spec->splitdir( $directories );
```

C<\$directories> must be only the directory portion of the path on systems that have the concept of a volume or that have path syntax that differentiates files from directories.

Unlike just splitting the directories on the separator, empty directory names (C<">) can be returned, because these are significant on some OSes.

=item catpath()

Takes volume, directory and file portions and returns an entire path. Under Unix, C<\$volume> is ignored, and directory and file are concatenated. A '/' is inserted if need be. On other OSes, C<\$volume> is significant.

```
$full_path = File::Spec->catpath( $volume, $directory, $file );
```

=item abs2rel

X<abs2rel> X<absolute, path> X<relative, path>

Takes a destination path and an optional base path returns a relative path from the base path to the destination path:

```
$rel_path = File::Spec->abs2rel( $path );  
$rel_path = File::Spec->abs2rel( $path, $base );
```

If C<\$base> is not present or "", then L<Cwd::cwd()|Cwd> is used. If C<\$base> is relative, then it is converted to absolute form using L</rel2abs()>. This means that it is taken to be relative to L<Cwd::cwd()|Cwd>.

On systems with the concept of volume, if C<\$path> and C<\$base> appear to be on two different volumes, we will not attempt to resolve the two paths, and we will instead simply return C<\$path>. Note that previous versions of this module ignored the volume of C<\$base>, which resulted in garbage results part of the time.

On

systems that have a grammar that indicates filenames, this ignores the C<\$base> filename as well. Otherwise all path components are assumed to be directories.

If C<\$path> is relative, it is converted to absolute form using L</rel2abs()>. This means that it is taken to be relative to L<Cwd::cwd()|Cwd>.

No checks against the filesystem are made. On VMS, there is interaction with the working environment, as logicals and macros are expanded.

Based on code written by Shigio Yamaguchi.

```
=item rel2abs()
```

```
X<rel2abs> X<absolute, path> X<relative, path>
```

Converts a relative path to an absolute path.

```
$abs_path = File::Spec->rel2abs( $path );  
$abs_path = File::Spec->rel2abs( $path, $base );
```

If C<\$base> is not present or "", then L<Cwd::cwd()|Cwd> is used. If C<\$base> is relative, then it is converted to absolute form using L</rel2abs()>. This means that it is taken to be relative to L<Cwd::cwd()|Cwd>.

On systems with the concept of volume, if C<\$path> and C<\$base> appear to be on

two different volumes, we will not attempt to resolve the two paths, and we will instead simply return C<\$path>. Note that previous versions of this module ignored the volume of C<\$base>, which resulted in garbage results part of the time.

On systems that have a grammar that indicates filenames, this ignores the C<\$base> filename as well. Otherwise all path components are assumed to be directories.

If C<\$path> is absolute, it is cleaned up and returned using L</canonpath>.

No checks against the filesystem are made. On VMS, there is interaction with the working environment, as logicals and

macros are expanded.

Based on code written by Shigio Yamaguchi.

=head1 NAME

Cwd - get pathname of current working directory

=head1 SYNOPSIS

```
use Cwd;  
my $dir = getcwd;
```

```
use Cwd 'abs_path';  
my $abs_path = abs_path($file);
```

=head1 DESCRIPTION

This module provides functions for determining the pathname of the current working directory. It is recommended that `getcwd` (or another `*cwd()` function) be used in I<all> code to ensure portability.

By default, it exports the functions `cwd()`, `getcwd()`, `fastcwd()`, and `fastgetcwd()` (and, on Win32, `getdcwd()`) into the caller's namespace.

=head2 getcwd and friends

Each of these functions are called without arguments and return the absolute path of the current working directory.

=over 4

=item getcwd

```
my $cwd = getcwd();
```

Returns the current working directory.

Exposes the POSIX function `getcwd(3)` or re-implements it if it's not available.

=item cwd

```
my $cwd = cwd();
```

The `cwd()` is the most natural form for the current architecture. For most systems it is identical to ``pwd`` (but without the trailing line terminator).

=item fastcwd

```
my $cwd = fastcwd();
```

A more dangerous version of `getcwd()`, but potentially faster.

It might conceivably `chdir()` you out of a directory that it can't `chdir()` you back into. If `fastcwd` encounters a problem it will return `undef` but will probably leave you in a different directory. For a measure of extra security, if everything appears to have worked, the `fastcwd()` function will check that it leaves you in the same directory that it started in. If it has changed it will `C<die>` with the message "Unstable directory path, current directory changed unexpectedly". That should never happen.

```
=item fastgetcwd
```

```
my $cwd = fastgetcwd();
```

The `fastgetcwd()` function is provided as a synonym for `cwd()`.

```
=item getdcwd
```

```
my $cwd = getdcwd();  
my $cwd = getdcwd('C:');
```

The `getdcwd()` function is also provided on Win32 to get the current working directory on the specified drive, since Windows maintains a separate current working directory for each drive. If no drive is specified then the current drive is assumed.

This function simply calls the Microsoft C library `_getdcwd()` function.

```
=back
```

```
=head2 abs_path and friends
```

These functions are exported only on request. They each take a single argument and return the absolute pathname for it. If no argument is given they'll use the current working directory.

```
=over 4
```

```
=item abs_path
```

```
my $abs_path = abs_path($file);
```

Uses the same algorithm as `getcwd()`. Symbolic links and relative-path components (".", "..") are resolved to return the canonical pathname, just like `realpath(3)`.

=item `realpath`

```
my $abs_path = realpath($file);
```

A synonym for `abs_path()`.

=item `fast_abs_path`

```
my $abs_path = fast_abs_path($file);
```

A more dangerous, but potentially faster version of `abs_path`.

=back

=head2 `$ENV{PWD}`

If you ask to override your `chdir()` built-in function,

```
use Cwd qw(chdir);
```

then your `PWD` environment

variable will be kept up to date. Note that

it will only be kept up to date if all packages which use `chdir` import it from `Cwd`.

=head1 NOTES

=over 4

=item \*

Since the path separators are different on some operating systems ( '/' on Unix, ':' on MacPerl, etc...) we recommend you use the `File::Spec` modules wherever portability is a concern.

=item \*

Actually, on Mac OS, the `C<getcwd()`, `C<fastgetcwd()` and `C<fastcwd()` functions are all aliases for the `C<cwd()` function, which, on Mac OS, calls ``pwd``. Likewise, the `C<abs_path()` function is an alias for `C<fast_abs_path()`.

=head1 NAME

Test::Tutorial - A tutorial about writing really basic tests

=head1 DESCRIPTION

I<AHHHHHHH!!!! NOT TESTING! Anything but testing!  
Beat me, whip me, send me to Detroit, but don't make  
me write tests!>

I<\*sob\*>

I<Besides, I don't know how to write the damned things.>

Is this you? Is writing tests right up there with writing  
documentation and having your fingernails pulled out? Did you open up  
a test and read

```
##### We start with some black magic
```

and decide that's quite enough for you?

It's ok. That's all gone now. We've done all the black magic for  
you. And here are the tricks...

=head2 Nuts and bolts of testing.

Here's the most basic test program.

```
#!/usr/bin/perl -w
```

```
print "1..1\n";
```

```
print 1 + 1 == 2 ? "ok 1\n" : "not ok 1\n";
```

since 1 + 1 is 2, it prints:

```
1..1
```

```
ok 1
```

What this says is: `C<1..1> "I'm going to run one test." [1] C<ok 1> "The first test passed".`

And that's about all magic there is to testing. Your basic unit of testing is the `I<ok>`. For each thing you test, an `C<ok>` is printed. Simple. `B<Test::Harness>` interprets your test results to determine if you succeeded or failed (more on that later).

Writing all these print statements rapidly gets tedious. Fortunately, there's `B<Test::Simple>`. It has one function, `C<ok()>`.

```
#!/usr/bin/perl -w

use Test::Simple tests => 1;

ok( 1 + 1 == 2 );
```

and that does the same thing as the code above. `C<ok()>` is the backbone of Perl testing, and we'll be using it instead of roll-your-own from here on. If `C<ok()>` gets a true value, the test passes. False, it fails.

```
#!/usr/bin/perl -w

use Test::Simple tests => 2;
ok( 1 + 1 == 2 );
ok( 2 + 2 == 5 );
```

from that comes

```
1..2
ok 1
not ok 2
# Failed test (test.pl at line 5)
# Looks like you failed 1 tests of 2.
```

`C<1..2> "I'm going to run two tests." This number is used to ensure your test program ran all the way through and didn't die or skip some tests. C<ok 1> "The first test passed." C<not ok 2> "The second test failed". Test::Simple helpfully prints out some extra commentary about your tests.`

It's not scary. Come, hold my hand. We're going to give an example of testing a module. For our example, we'll be testing a date library, `B<Date::ICal>`. It's on CPAN, so download a copy and follow along. [2]

=head2 Where to start?

This is the hardest part of testing, where do you start? People often get overwhelmed at the apparent enormity of the task of testing a whole module. Best place to start is at the beginning. `Date::ICal` is an object-oriented module, and that means you start by making an object. So we test `C<new()>`.

```
#!/usr/bin/perl -w

use Test::Simple tests => 2;

use Date::ICal;

my $ical = Date::ICal->new;    # create an object
ok( defined $ical );          # check that we got something
ok( $ical->isa('Date::ICal')
); # and it's the right class
```

run that and you should get:

```
1..2
ok 1
ok 2
```

congratulations, you've written your first useful test.

=head2 Names

That output isn't terribly descriptive, is it? When you have two tests you can figure out which one is #2, but what if you have 102?

Each test can be given a little descriptive name as the second argument to `C<ok()>`.

```
use Test::Simple tests => 2;

ok( defined $ical, 'new() returned something' );
ok( $ical->isa('Date::ICal'), " and it's the right class" );
```

So now you'd see...

```
1..2
ok 1 - new() returned something
ok 2 - and it's the right class
```

=head2 Test the manual

Simplest way to build up a decent testing suite is to just test what the manual says it does. [3] Let's pull something out of the L<Date::ICal/SYNOPSIS> and test that all its bits work.

```
#!/usr/bin/perl -w

use Test::Simple tests => 8;

use Date::ICal;

$ical = Date::ICal->new( year => 1964, month
=> 10, day => 16,
                        hour => 16, min => 12, sec => 47,
                        tz => '0530' );

ok( defined $ical,      'new() returned something' );
ok( $ical->isa('Date::ICal'), " and it's the right class" );
ok( $ical->sec == 47,    ' sec()' );
ok( $ical->min == 12,    ' min()' );
ok( $ical->hour == 16,   ' hour()' );
ok( $ical->day == 17,    ' day()' );
ok( $ical->month == 10,  ' month()' );
ok( $ical->year == 1964, ' year()' );
```

run that and you get:

```
1..8
ok 1 - new() returned something
ok 2 - and it's the right class
ok 3 - sec()
ok 4 - min()
ok 5 - hour()
not ok 6 - day()
# Failed test (- at line 16)
ok 7 - month()
ok 8 - year()
# Looks like you failed 1 tests of 8.
```

Whoops, a failure! [4] Test::Simple helpfully lets us know on what line the failure occurred, but not much else. We were supposed to get 17, but we didn't. What did we get?? Dunno. We'll have to re-run the test in the debugger or throw in some print statements to find out.

Instead, we'll switch from B<Test::Simple> to B<Test::More>. B<Test::More>

does everything B<Test::Simple> does, and more! In fact, Test::More does things I<exactly> the way Test::Simple does. You can literally swap Test::Simple out and put Test::More in its place. That's just what we're going to do.

Test::More does more than Test::Simple. The most important difference at this point is it provides more informative ways to say "ok".

Although you can write almost any test with a generic C<ok()>, it can't tell you what went wrong. Instead, we'll use the C<is()> function, which lets us declare that something is supposed to be the same as something else:

```
#!/usr/bin/perl -w

use Test::More tests => 8;

use Date::ICal;

$ical = Date::ICal->new( year => 1964, month => 10, day => 16,
                        hour => 16, min
=> 12, sec => 47,
                        tz => '0530' );

ok( defined $ical,      'new() returned something' );
ok( $ical->isa('Date::ICal'), " and it's the right class" );
is( $ical->sec,  47,    ' sec()' );
is( $ical->min,  12,    ' min()' );
is( $ical->hour, 16,    ' hour()' );
is( $ical->day,  17,    ' day()' );
is( $ical->month, 10,   ' month()' );
is( $ical->year, 1964,  ' year()' );
```

"Is C<\$ical-E<gt>sec> 47?" "Is C<\$ical-E<gt>min> 12?" With C<is()> in place, you get some more information

```
1..8
ok 1 - new() returned something
ok 2 - and it's the right class
ok 3 - sec()
ok 4 - min()
ok 5 - hour()
not ok 6 - day()
# Failed test (- at line 16)
# got: '16'
# expected: '17'
ok 7 - month()
ok 8 - year()
# Looks like you failed 1 tests of 8.
```

letting us know that `C<$ical->day>` returned 16, but we expected 17. A quick check shows that the code is working fine, we made a mistake when writing up the tests. Just change it to:

```
is( $ical->day, 16, ' day()' );
```

and everything works.

So any time you're doing a "this equals that" sort of test, use `C<is()>`. It even works on arrays. The test is always in scalar context, so you can test how many elements are in a list this way. [5]

```
is( @foo, 5, 'foo has 5 elements' );
```

=head2 Sometimes the tests are wrong

Which brings us to a very important lesson. Code has bugs. Tests are code. Ergo, tests have bugs. A failing test could mean a bug in the code, but don't discount the possibility that the test is wrong.

On the flip side, don't be tempted to prematurely declare a test incorrect just because you're having trouble finding the bug. Invalidating a test isn't something to be taken lightly, and don't use it as a cop out to avoid work.

=head2 Testing lots of values

We're going to be wanting to test a lot of dates here, trying to trick the code with lots of different edge cases. Does it work before 1970? After 2038? Before 1904? Do years after 10,000 give it trouble? Does it get leap years right? We could keep repeating the code above, or we could set up a little try/expect loop.

```
use Test::More tests => 32;
use Date::ICal;
```

```
my %ICal_Dates = (
    # An ICal string    And the year, month, date
    #                   hour, minute and second we expect.
    '19971024T120000' => # from the docs.
        [ 1997, 10, 24, 12, 0, 0 ],
    '20390123T232832' => # after the Unix epoch
        [ 2039, 1, 23, 23, 28, 32 ],
```

```

'19671225T000000' => # before the Unix epoch
    [ 1967, 12, 25, 0, 0, 0 ],
'18990505T232323' => # before the MacOS epoch
    [ 1899, 5, 5, 23, 23, 23 ],
);

```

```

while( my($ical_str, $expect)
= each %ICal_Dates ) {
    my $ical = Date::ICal->new( ical => $ical_str );

    ok( defined $ical,      "new(ical => '$ical_str')" );
    ok( $ical->isa('Date::ICal'), " and it's the right class" );

    is( $ical->year,  $expect->[0],  ' year()' );
    is( $ical->month, $expect->[1],  ' month()' );
    is( $ical->day,   $expect->[2],  ' day()' );
    is( $ical->hour,  $expect->[3],  ' hour()' );
    is( $ical->min,   $expect->[4],  ' min()' );
    is( $ical->sec,   $expect->[5],  ' sec()' );
}

```

So now we can test bunches of dates by just adding them to C<%ICal\_Dates>. Now that it's less work to test with more dates, you'll be inclined to just throw more in as you think of them. Only problem is, every time we add to that we have to keep adjusting the C<use Test::More tests =>E<gt> ##> line. That can rapidly get annoying. There's two ways to make this work better.

First, we can calculate the plan dynamically using the C<plan()> function.

```

use Test::More;
use Date::ICal;

my %ICal_Dates = (
    ...same as before...
);

# For each key in the hash we're running 8 tests.
plan tests => keys %ICal_Dates * 8;

```

Or to be even more flexible, we use C<no\_plan>. This means we're just running some tests, don't know how many. [6]

```

use Test::More 'no_plan'; # instead of tests => 32

```

now we can just add tests and not have to do all sorts of math to figure out how many we're running.

```
=head2 Informative names
```

Take a look at this line here

```
ok( defined $ical,      "new(ical => '$ical_str')");
```

we've added more detail about what we're testing and the ICal string itself we're trying out to the name. So you get results like:

```
ok 25 - new(ical => '19971024T120000')
ok 26 - and it's the right class
ok 27 - year()
ok 28 - month()
ok 29 - day()
ok 30 - hour()
ok 31 - min()
ok 32 - sec()
```

if something

in there fails, you'll know which one it was and that will make tracking down the problem easier. So try to put a bit of debugging information into the test names.

Describe what the tests test, to make debugging a failed test easier for you or for the next person who runs your test.

```
=head2 Skipping tests
```

Poking around in the existing Date::ICal tests, I found this in `F<t/01sanity.t> [7]`

```
#!/usr/bin/perl -w

use Test::More tests => 7;
use Date::ICal;

# Make sure epoch time is being handled sanely.
my $t1 = Date::ICal->new( epoch => 0 );
is( $t1->epoch, 0,      "Epoch time of 0" );

# XXX This will only work on unix systems.
is( $t1->ical, '19700101Z', " epoch to ical" );
```

```

is( $t1->year, 1970, " year()" );
is( $t1->month, 1, " month()" );
is( $t1->day, 1, " day()" );

# like the tests above, but starting with ical instead of epoch
my $t2 = Date::ICal->new( ical => '19700101Z' );
is(
$t2->ical, '19700101Z', "Start of epoch in ICal notation" );

is( $t2->epoch, 0, " and back to ICal" );

```

The beginning of the epoch is different on most non-Unix operating systems [8]. Even though Perl smooths out the differences for the most part, certain ports do it differently. MacPerl is one off the top of my head. [9] We I<know> this will never work on MacOS. So rather than just putting a comment in the test, we can explicitly say it's never going to work and skip the test.

```

use Test::More tests => 7;
use Date::ICal;

# Make sure epoch time is being handled sanely.
my $t1 = Date::ICal->new( epoch => 0 );
is( $t1->epoch, 0, "Epoch time of 0" );

SKIP: {
    skip('epoch to ICal not working on MacOS', 6)
        if $^O eq 'MacOS';

    is( $t1->ical, '19700101Z', " epoch to ical" );

    is( $t1->year, 1970, " year()" );
    is( $t1->month, 1, " month()" );
    is( $t1->day, 1, "
day()" );

    # like the tests above, but starting with ical instead of epoch
    my $t2 = Date::ICal->new( ical => '19700101Z' );
    is( $t2->ical, '19700101Z', "Start of epoch in ICal notation" );

    is( $t2->epoch, 0, " and back to ICal" );
}

```

A little bit of magic happens here. When running on anything but MacOS, all the tests run normally. But when on MacOS, C<skip()> causes the entire contents of the SKIP block to be jumped over. It's never run. Instead, it prints special output that tells Test::Harness that the tests have been skipped.

1..7

ok 1 - Epoch time of 0

ok 2 # skip epoch to ICal not working on MacOS

ok 3 # skip epoch to ICal not working on MacOS

ok 4 # skip epoch to ICal not working on MacOS

ok 5 # skip epoch to ICal not working on MacOS

ok 6 # skip epoch to ICal not working on MacOS

ok 7 # skip epoch to ICal not working on MacOS

This means your tests won't fail on MacOS. This means less emails from

MacPerl users telling you about failing tests that you know will never work. You've got to be careful with skip tests. These are for tests which don't work and I<never will>. It is not for skipping genuine bugs (we'll get to that in a moment).

The tests are wholly and completely skipped. [10] This will work.

```
SKIP: {  
    skip("I don't wanna die!");  
  
    die, die, die, die, die;  
}
```

=head2 Todo tests

Thumbing through the Date::ICal man page, I came across this:

ical

```
$ical_string = $ical->ical;
```

Retrieves, or sets, the date on the object, using any valid ICal date/time string.

"Retrieves or sets". Hmm, didn't see a test for using C<ical()> to set the date in the Date::ICal test suite. So I'll write one.

```
use Test::More tests => 1;  
use Date::ICal;
```

```
my $ical = Date::ICal->new;  
$ical->ical('20201231Z');  
is( $ical->ical, '20201231Z', 'Setting via ical() );
```

run that and I get

```
1..1
not ok 1 - Setting via ical()
# Failed test (- at line 6)
# got: '20010814T233649Z'
# expected: '20201231Z'
# Looks like you failed 1 tests of 1.
```

Whoops! Looks like it's unimplemented. Let's assume we don't have the time to fix this. [11] Normally, you'd just comment out the test and put a note in a todo list somewhere. Instead, we're going to explicitly state "this test will fail" by wrapping it in a C<TODO> block.

```
use Test::More tests => 1;

TODO: {
    local $TODO = 'ical($ical) not yet implemented';

    my $ical = Date::ICal->new;
    $ical->ical('20201231Z');

    is( $ical->ical, '20201231Z', 'Setting via ical()' );
}
```

Now when you run, it's a little different:

```
1..1
not ok 1 - Setting via ical() # TODO ical($ical) not yet implemented
# got: '20010822T201551Z'
# expected: '20201231Z'
```

Test::More doesn't say "Looks like you failed 1 tests of 1". That '# TODO' tells Test::Harness "this is supposed to fail" and it treats a failure as a successful test. So you can write tests even before you've fixed the underlying code.

If a TODO test passes, Test::Harness will report it "UNEXPECTEDLY SUCCEEDED". When that happens, you simply remove the TODO block with C<local \$TODO> and turn it into a real test.

=head2 Testing with taint mode.

Taint mode is a funny thing. It's the globalest of all global features. Once you turn it on, it affects I<all> code in your program and I<all> modules used (and all the modules they use). If a single piece of code isn't taint clean, the whole thing explodes. With that

in mind, it's very important to ensure your module works under taint mode.

It's very simple to have your tests run under taint mode. Just throw a `C<-T>` into the `C<#!>` line. `Test::Harness` will read the switches in `C<#!>` and use them to run your tests.

```
#!/usr/bin/perl -Tw
```

```
...test normally here...
```

So when you say `C<make test>` it will be run with taint mode and warnings on.

=head1 FOOTNOTES

=over

4

=item 1

The first number doesn't really mean anything, but it has to be 1. It's the second number that's important.

=item 2

For those following along at home, I'm using version 1.31. It has some bugs, which is good -- we'll uncover them with our tests.

=item 3

You can actually take this one step further and test the manual itself. Have a look at `B<Test::Inline>` (formerly `B<Pod::Tests>`).

=item 4

Yes, there's a mistake in the test suite. What! Me, contrived?

=item 5

We'll get to testing the contents of lists later.

=item 6

But what happens if your test program dies halfway through?! Since we didn't say how many tests we're going to run, how can we know it failed? No problem, `Test::More` employs some magic to catch that death

and turn the test into a failure, even if every test passed up to that point.

=item 7

I cleaned it up a little.

=item 8

Most Operating Systems record time as the number of seconds since a certain date. This date is the beginning of the epoch. Unix's starts at midnight January 1st, 1970 GMT.

=item 9

MacOS's epoch is midnight January 1st, 1904. VMS's is midnight, November 17th, 1858, but vmsperl emulates the Unix epoch so it's not a problem.

=item 10

As long as the code inside the SKIP block at least compiles. Please don't ask how. No, it's not a filter.

=item 11

Do NOT be tempted to use TODO tests as a way to avoid fixing simple bugs!

=head1 NAME

File::Spec::Functions - portably perform operations on file names

=head1 SYNOPSIS

```
use File::Spec::Functions;
```

```
$x = catfile('a','b');
```

=head1 DESCRIPTION

This module exports convenience functions for all of the class methods provided by File::Spec.

For a reference of available functions, please consult [L<File::Spec::Unix>](#), which contains the entire set, and which is inherited by the modules for other platforms. For further information, please see [L<File::Spec::Mac>](#), [L<File::Spec::OS2>](#), [L<File::Spec::Win32>](#), or [L<File::Spec::VMS>](#).

=head2 Exports

The following functions are exported by default.

- canonpath
- catdir
- catfile
- curdir
- rootdir
- updir
- no\_upwards
- file\_name\_is\_absolute
- path

The following functions are exported only by request.

- devnull
- tmpdir
- splitpath

splitdir  
catpath  
abs2rel  
rel2abs  
case\_tolerant

All the functions may be imported using the C<:ALL> tag.

=head1 NAME

File::Spec::OS2 - methods for OS/2 file specs

=head1 SYNOPSIS

require File::Spec::OS2; # Done internally by File::Spec if needed

=head1 DESCRIPTION

See L<File::Spec> and L<File::Spec::Unix>. This package overrides the implementation of these methods, not the semantics.

Amongst the changes made for OS/2 are...

=over 4

=item tmpdir

Modifies the list of places temp directory information is looked for.

```
$ENV{TMPDIR}
$ENV{TEMP}
$ENV{TMP}
/tmp
/
```

=item splitpath

Volumes can be drive letters or UNC sharenames (\\server\share).

=head1 EXIT CODES

If all your tests passed, Test::Builder will exit with zero (which is normal). If anything failed it will exit with how many failed. If you run less (or more) tests than you planned, the missing (or extras) will be considered failures. If no tests were ever run Test::Builder will throw a warning and exit with 255. If the test died, even after having successfully completed all its tests, it will still be considered a failure and will exit with 255.

So the exit codes are...

|                  |   |
|------------------|---|
| 0                | all tests successful                          |
| 255              | test died                                     |
| any other number | how many failed (including missing or extras) |

If you fail more than 254 tests, it will be reported as 254.

=head1 NOTES

Test::More is B<explicitly> tested all the way back to perl 5.004.

=head1 BUGS and CAVEATS

=over 4

=item Threads

Test::More will only be aware of threads if "use threads" has been done  
I<before>

Test::More is loaded. This is ok:

```
use threads;  
use Test::More;
```

This may cause problems:

```
use Test::More  
use threads;
```

=item Making your own ok()

If you are trying to extend Test::More, don't. Use Test::Builder instead.

=item The eq\_\* family has some caveats.

=item Test::Harness upgrade

no\_plan and todo depend on new Test::Harness features and fixes. If you're going to distribute tests that use no\_plan or todo your end-users will have to upgrade Test::Harness to the latest one on CPAN. If you avoid no\_plan and TODO tests, the stock Test::Harness will work fine.

Installing Test::More should also upgrade Test::Harness.

=back

=head1 HISTORY

This is a case of convergent evolution with Joshua Pritikin's Test module. I was largely unaware of its existence when I'd first written my own ok() routines. This module exists because I can't figure out how to easily wedge test names into Test's interface (along with a few other problems).

The goal here is to have  
a testing utility that's simple to learn,  
quick to use and difficult to trip yourself up with while still  
providing more flexibility than the existing Test.pm. As such, the

names of the most common routines are kept tiny, special cases and magic side-effects are kept to a minimum. WYSIWYG.

=head1 SEE ALSO

L<Test::Simple> if all this confuses you and you just want to write some tests. You can upgrade to Test::More later (it's forward compatible).

L<Test> is the old testing module. Its main benefit is that it has been distributed with Perl since 5.004\_05.

L<Test::Harness> for details on how your test results are interpreted by Perl.

L<Test::Differences> for more ways to test complex data structures. And it plays well with Test::More.

L<Test::Class> is like XUnit but more perl-ish.

L<Test::Deep> gives you more powerful complex data structure testing.

L<Test::Unit> is XUnit style testing.

L<Test::Inline> shows the idea of embedded testing.

L<Bundle::Test> installs a whole bunch of useful test modules.

=head1 NAME

Net::HTTP::NB - Non-blocking HTTP client

=head1 SYNOPSIS

use Net::HTTP::NB;

```
my $s = Net::HTTP::NB->new(Host => "www.perl.com") || die $@;
$s->write_request(GET => "/");
```

```
use IO::Select;
my $sel = IO::Select->new($s);
```

```
READ_HEADER: {
    die "Header timeout" unless $sel->can_read(10);
    my($code, $mess, %h) = $s->read_response_headers;
    redo READ_HEADER unless $code;
}
```

```
while (1) {
    die "Body timeout" unless $sel->can_read(10);
    my $buf;
    my $n = $s->read_entity_body($buf, 1024);
    last unless $n;
    print $buf;
}
```

=head1 DESCRIPTION

Same interface as C<Net::HTTP> but it will never try multiple reads when the read\_response\_headers() or read\_entity\_body() methods are invoked. This make it possible to multiplex multiple Net::HTTP::NB using select without risk blocking.

If read\_response\_headers() did not see enough data to complete the headers an empty list is returned.

If read\_entity\_body()  
did not see new entity data in its read  
the value -1 is returned.

=head1 NAME

Net::HTTP - Low-level HTTP connection (client)

=head1 SYNOPSIS

```
use Net::HTTP;
my $s = Net::HTTP->new(Host => "www.perl.com") || die $@;
$s->write_request(GET => "/", 'User-Agent' => "Mozilla/5.0");
my($code, $mess, %h) = $s->read_response_headers;
```

```
while (1) {
    my $buf;
    my $n = $s->read_entity_body($buf, 1024);
    die "read failed: $!" unless defined $n;
    last unless $n;
    print $buf;
}
```

=head1 DESCRIPTION

The C<Net::HTTP> class is a low-level HTTP client. An instance of the C<Net::HTTP> class represents a connection to an HTTP server. The HTTP protocol is described in RFC 2616. The C<Net::HTTP> class supports C<HTTP/1.0> and C<HTTP/1.1>.

C<Net::HTTP> is a sub-class of C<IO::Socket::INET>. You can mix the methods described below with reading and writing from the socket directly. This is not necessary a good idea, unless you know what you are doing.

The following methods are provided

(in addition to those of

C<IO::Socket::INET>):

=over

=item \$s = Net::HTTP->new( %options )

The C<Net::HTTP> constructor method takes the same options as C<IO::Socket::INET>'s as well as these:

Host: Initial host attribute value

KeepAlive: Initial keep\_alive attribute value

SendTE: Initial send\_te attribute\_value  
HTTPVersion: Initial http\_version attribute value  
PeerHTTPVersion: Initial peer\_http\_version attribute value  
MaxLineLength: Initial max\_line\_length attribute value  
MaxHeaderLines: Initial max\_header\_lines attribute value

The C<Host> option is also the default for C<IO::Socket::INET>'s C<PeerAddr>. The C<PeerPort> defaults to 80 if not provided.

The C<Listen> option provided by C<IO::Socket::INET>'s constructor method is not allowed.

If unable to connect to the given HTTP server then the constructor returns C<undef> and \$@ contains the reason. After a successful connect, a C<Net::HTTP> object is returned.

=item \$s->host

Get/set

the default value of the C<Host> header to send. The \$host must not be set to an empty string (or C<undef>) for HTTP/1.1.

=item \$s->keep\_alive

Get/set the I<keep-alive> value. If this value is TRUE then the request will be sent with headers indicating that the server should try to keep the connection open so that multiple requests can be sent.

The actual headers set will depend on the value of the C<http\_version> and C<peer\_http\_version> attributes.

=item \$s->send\_te

Get/set the a value indicating if the request will be sent with a "TE" header to indicate the transfer encodings that the server can choose to use. The list of encodings announced as accepted by this client depends on availability of the following modules: C<Compress::Raw::Zlib> for I<deflate>, and C<IO::Compress::Gunzip> for I<gzip>.

=item \$s->http\_version

Get/set the HTTP version number that this client should announce. This value can only be set to "1.0" or "1.1". The default is "1.1".

=item \$s->peer\_http\_version

Get/set

the protocol version number of our peer. This value will initially be "1.0", but will be updated by a successful `read_response_headers()` method call.

```
=item $s->max_line_length
```

Get/set a limit on the length of response line and response header lines. The default is 8192. A value of 0 means no limit.

```
=item $s->max_header_length
```

Get/set a limit on the number of header lines that a response can have. The default is 128. A value of 0 means no limit.

```
=item $s->format_request($method, $uri, %headers, [$content])
```

Format a request message and return it as a string. If the headers do not include a `C<Host>` header, then a header is inserted with the value of the `C<host>` attribute. Headers like `C<Connection>` and `C<Keep-Alive>` might also be added depending on the status of the `C<keep_alive>` attribute.

If `$content` is given (and it is non-empty), then a `C<Content-Length>` header is automatically added unless it was already present.

```
=item $s->write_request($method,  
$uri, %headers, [$content])
```

Format and send a request message. Arguments are the same as for `format_request()`. Returns true if successful.

```
=item $s->format_chunk( $data )
```

Returns the string to be written for the given chunk of data.

```
=item $s->write_chunk($data)
```

Will write a new chunk of request entity body data. This method should only be used if the `C<Transfer-Encoding>` header with a value of `C<chunked>` was sent in the request. Note, writing zero-length data is a no-op. Use the `write_chunk_eof()` method to signal end of entity body data.

Returns true if successful.

```
=item $s->format_chunk_eof( %trailers )
```

Returns the string to be written for signaling EOF when a

C<Transfer-Encoding> of C<chunked> is used.

```
=item $s->write_chunk_eof( %trailers )
```

Will write eof marker for chunked data and optional trailers. Note that trailers should not really be used unless is was signaled with a C<Trailer> header.

Returns true if successful.

```
=item ($code, $mess, %headers) = $s->read_response_headers(
    %opts )
```

Read response headers from server and return it. The \$code is the 3 digit HTTP status code (see L<HTTP::Status>) and \$mess is the textual message that came with it. Headers are then returned as key/value pairs. Since key letter casing is not normalized and the same key can even occur multiple times, assigning these values directly to a hash is not wise. Only the \$code is returned if this method is called in scalar context.

As a side effect this method updates the 'peer\_http\_version' attribute.

Options might be passed in as key/value pairs. There are currently only two options supported; C<laxed> and C<junk\_out>.

The C<laxed> option will make read\_response\_headers() more forgiving towards servers that have not learned how to speak HTTP properly. The C<laxed> option is a boolean flag, and is enabled by passing in a TRUE value. The C<junk\_out> option can be used to capture bad header lines when C<laxed> is enabled. The value should be an array reference.

Bad

header lines will be pushed onto the array.

The C<laxed> option must be specified in order to communicate with pre-HTTP/1.0 servers that don't describe the response outcome or the data they send back with a header block. For these servers peer\_http\_version is set to "0.9" and this method returns (200, "Assumed OK").

The method will raise an exception (die) if the server does not speak proper HTTP or if the C<max\_line\_length> or C<max\_header\_length> limits are reached. If the C<laxed> option is turned on and C<max\_line\_length> and C<max\_header\_length> checks are turned off, then no exception will be raised and this method will always return a response code.

```
=item $n = $s->read_entity_body($buf, $size);
```

Reads chunks of the entity body content. Basically the same interface as for `read()` and `sysread()`, but the buffer offset argument is not supported yet. This method should only be called after a successful `read_response_headers()` call.

The return value will be `C<undef>` on read errors, 0 on EOF, -1 if no data could be returned this time, otherwise the number of bytes assigned to `$buf`. The `$buf` is set to "" when the return value is -1.

You normally want to retry this call if this function returns either -1 or `C<undef>` with `C<$!>` as `EINTR` or `EAGAIN` (see `L<Errno>`). `EINTR` can happen if the application catches signals and `EAGAIN` can happen if you made the socket non-blocking.

This method will raise exceptions (`die`) if the server does not speak proper HTTP. This can only happen when reading chunked data.

```
=item %headers = $s->get_trailers
```

After `read_entity_body()` has returned 0 to indicate end of the entity body, you might call this method to pick up any trailers.

```
=item $s->_rbuf
```

Get/set the read buffer content. The `read_response_headers()` and `read_entity_body()` methods use an internal buffer which they will look for data before they actually `sysread` more from the socket itself. If they read too much, the remaining data will be left in this buffer.

```
=item  
$s->_rbuf_length
```

Returns the number of bytes in the read buffer. This should always be the same as:

```
length($s->_rbuf)
```

but might be more efficient.

```
=back
```

```
=head1 SUBCLASSING
```

The `read_response_headers()` and `read_entity_body()` will invoke the `sysread()` method when they need more data. Subclasses might want to

override this method to control how reading takes place.

The object itself is a glob. Subclasses should avoid using hash key names prefixed with C<http\_> and C<io\_>.

## NAME

Net::HTTP - Low-level HTTP connection (client)

## SYNOPSIS

```
use Net::HTTP;
my $s = Net::HTTP->new(Host => "www.perl.com") || die $@;
$s->write_request(GET => "/", 'User-Agent' => "Mozilla/5.0");
my($code, $mess, %h) = $s->read_response_headers;
```

```
while (1) {
    my $buf;
    my $n = $s->read_entity_body($buf, 1024);
    die "read failed: $!" unless defined $n;
    last unless $n;
    print $buf;
}
```

## DESCRIPTION

The `Net::HTTP` class is a low-level HTTP client. An instance of the `Net::HTTP` class represents a connection to an HTTP server. The HTTP protocol is described in RFC 2616. The `Net::HTTP` class supports `HTTP/1.0` and `HTTP/1.1`.

`Net::HTTP` is a sub-class of `IO::Socket::INET`. You can mix the methods described below with reading and writing from the socket

directly. This is not necessarily a good idea, unless you know what you are doing.

The following methods are provided (in addition to those of ``IO::Socket::INET'`):

```
$s = Net::HTTP->new( %options )
```

The ``Net::HTTP'` constructor method takes the same options as ``IO::Socket::INET'`s as well as these:

Host:           Initial host attribute value  
KeepAlive:      Initial keep\_alive attribute value  
SendTE:         Initial send\_te attribute\_value  
HTTPVersion:    Initial http\_version attribute value  
PeerHTTPVersion: Initial peer\_http\_version attribute value  
MaxLineLength:  Initial max\_line\_length attribute value  
MaxHeaderLines: Initial max\_header\_lines attribute value

The ``Host'` option is also the default for ``IO::Socket::INET'`s ``PeerAddr'`. The ``PeerPort'` defaults to 80 if not provided.

The ``Listen'` option provided by ``IO::Socket::INET'`s constructor method is not allowed.

If unable to connect to the given HTTP server then the constructor returns ``undef'` and `$@` contains the reason. After a successful connect, a ``Net::HTTP'` object is returned.

```
$s->host
```

Get/set the default value of the ``Host'` header to send. The `$host` must not be set to an empty string (or ``undef'`) for HTTP/1.1.

```
$s->keep_alive
```

Get/set the `*keep-alive*` value. If this value is `TRUE` then the request will be sent with headers indicating that the server should try to keep the connection open so that multiple requests can be sent.

The actual headers set will depend on the value of the ``http_version'` and ``peer_http_version'` attributes.

```
$s->send_te
```

Get/set the a value indicating if the request will be sent with a "TE" header to indicate the transfer encodings that the server can choose to use. The list of encodings announced as accepted by this client depends on availability of the following modules:

```
`Compress::Raw::Zlib'
```

for `*deflate*`, and ``IO::Compress::Gunzip'` for `*gzip*`.

`$$->http_version`

Get/set the HTTP version number that this client should announce. This value can only be set to "1.0" or "1.1". The default is "1.1".

`$$->peer_http_version`

Get/set the protocol version number of our peer. This value will initially be "1.0", but will be updated by a successful `read_response_headers()` method call.

`$$->max_line_length`

Get/set a limit on the length of response line and response header lines. The default is 8192. A value of 0 means no limit.

`$$->max_header_length`

Get/set a limit on the number of header lines that a response can have. The default is 128. A value of 0 means no limit.

`$$->format_request($method, $uri, %headers, [$content])`

Format a request message and return it as a string. If the headers do not include a ``Host'` header, then a header is inserted with the value of the ``host'` attribute. Headers like ``Connection'` and ``Keep-Alive'` might also be added depending on the status of the ``keep_alive'` attribute.

If `$content` is given (and it is non-empty), then a ``Content-Length'` header is automatically added unless it was already present.

`$$->write_request($method, $uri, %headers, [$content])`

Format and send a request message. Arguments are the same as for `format_request()`. Returns true if successful.

`$$->format_chunk( $data )`

Returns the string to be written for the given chunk of data.

`$$->write_chunk($data)`

Will write a new chunk of request entity body data. This method should only be used if the ``Transfer-Encoding'` header with a value of ``chunked'` was sent in the request. Note, writing zero-length data is a no-op. Use the `write_chunk_eof()` method to signal end of entity body data.

Returns true if successful.

`$$->format_chunk_eof(`

`%trailers )`

Returns the string to be written for signaling EOF when a ``Transfer-Encoding'` of ``chunked'` is used.

`$s->write_chunk_eof( %trailers )`

Will write eof marker for chunked data and optional trailers. Note that trailers should not really be used unless it was signaled with a ``Trailer'` header.

Returns true if successful.

`($code, $mess, %headers) = $s->read_response_headers( %opts )`

Read response headers from server and return it. The `$code` is the 3 digit HTTP status code (see `HTTP::Status`) and `$mess` is the textual message that came with it. Headers are then returned as key/value pairs. Since key letter casing is not normalized and the same key can even occur multiple times, assigning these values directly to a hash is not wise. Only the `$code` is returned if this method is called in scalar context.

As a side effect this method updates the `'peer_http_version'` attribute.

Options might be passed in as key/value pairs. There are currently only two options supported; ``laxed'` and ``junk_out'`.

The ``laxed'` option will make `read_response_headers()` more forgiving towards servers that have not learned how to speak HTTP properly. The ``laxed'` option is a boolean flag, and is enabled by passing in a `TRUE` value. The ``junk_out'` option can be used to capture bad header lines when ``laxed'` is enabled. The value should be an array reference. Bad header lines will be pushed onto the array.

The ``laxed'` option must be specified in order to communicate with pre-HTTP/1.0 servers that don't describe the response outcome or the data they send back with a header block. For these servers `peer_http_version` is set to "0.9" and this method returns (200, "Assumed OK").

The method will raise an exception (die) if the server does not speak proper HTTP or if the ``max_line_length'` or ``max_header_length'` limits are reached. If the ``laxed'` option is turned on and ``max_line_length'` and ``max_header_length'` checks are turned off, then no exception will be raised and this method will always return a response code.

`$n = $s->read_entity_body($buf, $size);`

Reads chunks of the entity body content. Basically the same

interface as for `read()` and `sysread()`, but the buffer offset argument is not supported yet. This method should only be called after a successful `read_response_headers()` call.

The return value will be ``undef'` on read errors, 0 on EOF, -1 if no data could be returned this time, otherwise the number of bytes assigned to `$buf`. The `$buf` is set to `""` when the return value is -1.

You normally want to retry this call if this function returns either -1 or ``undef'` with ``$!'` as `EINTR` or `EAGAIN` (see `Errno`). `EINTR` can happen if the application catches signals and `EAGAIN` can happen if you made the socket non-blocking.

This method will raise exceptions (`die`) if the server does not speak proper HTTP. This can only happen when reading chunked data.

`%headers = $s->get_trailers`

After `read_entity_body()` has returned 0 to indicate end of the entity body, you might call this method to pick up any trailers.

`$s->_rbuf`

Get/set the read buffer content. The `read_response_headers()` and `read_entity_body()` methods use an internal buffer which they will look for data before they actually `sysread` more from the socket itself. If they read too much, the remaining data will be left in this buffer.

`$s->_rbuf_length`

Returns the number of bytes in the read buffer. This should always be the same as:

```
length($s->_rbuf)
```

but might be more efficient.

## SUBCLASSING

The `read_response_headers()` and `read_entity_body()` will invoke the `sysread()` method when they need more data. Subclasses might want to override this method to control how reading takes place.

The object itself is a glob. Subclasses should avoid using hash key names prefixed with ``http_'` and ``io_'`.

=head1 NAME

Pod::Simple::Methody -- turn Pod::Simple events into method calls

=head1 SYNOPSIS

```
require 5;
```

```
use strict;
```

```

package SomePodFormatter;
use base qw(Pod::Simple::Methody);

sub handle_text {
    my($self, $text) = @_;
    ...
}

sub start_head1 {
    my($self, $attrs) = @_;
    ...
}
sub end_head1 {
    my($self) = @_;
    ...
}

```

...and start\_/end\_ methods for whatever other events you want to catch.

=head1 DESCRIPTION

This class is of interest to people writing Pod formatters based on Pod::Simple.

This class (which is very small -- read the source) overrides Pod::Simple's `_handle_element_start`, `_handle_text`, and `_handle_element_end` methods so that parser events are turned into method calls. (Otherwise, this is a subclass of L<Pod::Simple> and inherits all its methods.)

You can use this class as the base class for a Pod formatter/processor.

=head1 METHOD CALLING

When Pod::Simple sees a "`=head1 Hi there`", for example, it basically does this:

```

$parser->_handle_element_start( "head1", \%attributes );
$parser->_handle_text( "Hi there" );
$parser->_handle_element_end( "head1" );

```

But if you subclass Pod::Simple::Methody, it will instead do this when it sees a "`=head1 Hi there`":

```

$parser->start_head1( \%attributes ) if $parser->can('start_head1');
$parser->handle_text( "Hi there" ) if $parser->can('handle_text');
$parser->end_head1() if $parser->can('end_head1');

```

If Pod::Simple sends an event where the element name has a dash, period, or colon, the corresponding method name will have an underscore in its place. For example, "foo.bar:baz" becomes start\_foo\_bar\_baz and end\_foo\_bar\_baz.

See the source for Pod::Simple::Text for an example of using this class.

=head1 NAME

Pod::Simple::Text -- format Pod as plaintext

=head1 SYNOPSIS

```
perl -MPod::Simple::Text -e \  
"exit Pod::Simple::Text->filter(shift)->any_errata_seen" \  
thingy.pod
```

=head1 DESCRIPTION

This class is a formatter that takes Pod and renders it as wrapped plaintext.

Its wrapping is done by L<Text::Wrap>, so you can change C<\$Text::Wrap::columns> as you like.

This is a subclass of L<Pod::Simple> and inherits all its methods.

  {},
  'pie'
],
!
]
```

## =head1 DESCRIPTION

This class is of interest to people writing a Pod processor/formatter.

This class takes Pod and parses it, returning a parse tree made just of arrayrefs, and hashrefs, and strings.

This is a subclass  
of `L<Pod::Simple>` and inherits all its methods.

This class is inspired by `XML::Parser`'s "Tree" parsing-style, although it doesn't use exactly the same LoL format.

## =head1 METHODS

At the end of the parse, call `C<< $parser->root >>` to get the tree's top node.

## =head1 Tree Contents

Every element node in the parse tree is represented by an arrayref of the form: `C<[ I<elementname>, \%attributes, I<...subnodes...> ]>`.  
See the example tree dump in the Synopsis, above.

Every text node in the tree is represented by a simple (non-ref) string scalar. So you can test `C<ref($node)>` to see whether you have an element node or just a text node.

The top node in the tree is `C<[ 'Document', \%attributes, I<...subnodes...> ]>`

## =head1 SEE ALSO

=head1 NAME

Pod::Simple::TextContent -- get the text content of Pod

=head1 SYNOPSIS

TODO

```
perl -MPod::Simple::TextContent -e \  
"exit Pod::Simple::TextContent->filter(shift)->any_errata_seen" \  
thingy.pod
```

=head1 DESCRIPTION

This class is that parses Pod and dumps just the text content. It is mainly meant for use by the Pod::Simple test suite, but you may find some other use for it.

This is a subclass of L<Pod::Simple> and inherits all its methods.

=head1 SEE ALSO

L<Pod::Simple>, L<Pod::Simple::Text>, L<Pod::Spell>

=head1 SUPPORT

Questions or discussion about POD and Pod::Simple should be sent to the pod-people@perl.org mail list. Send an empty email to pod-people-subscribe@perl.org to subscribe.

This module is managed in an open GitHub repository, L<<https://github.com/theory/pod-simple/>>. Feel free to fork and contribute, or to clone L<[git://github.com/theory/pod-simple.git](https://github.com/theory/pod-simple.git)> and send patches!

Patches

against Pod::Simple are welcome. Please send bug reports to <[bug-pod-simple@rt.cpan.org](mailto:bug-pod-simple@rt.cpan.org)>.

=head1 NAME

Pod::Simple::PullParserTextToken -- text-tokens from Pod::Simple::PullParser

=head1 SYNOPSIS

(See L<Pod::Simple::PullParser>)

=head1 DESCRIPTION

When you do `$parser->get_token` on a L<Pod::Simple::PullParser>, you might get an object of this class.

This is a subclass of L<Pod::Simple::PullParserToken> and inherits all its methods, and adds these methods:

=over

=item \$token->text

This returns the text that this token holds. For example, parsing CZ<<<foo> will return a C start-token, a text-token, and a C end-token. And if you want to get the "foo" out of the text-token, call C<< \$token->text >>

=item \$token->text(I<somestring>)

This changes the string that this token holds. You probably won't need to do this.

=item \$token->text\_r()

This returns a scalar reference to the string that this token holds. This can be useful if you don't want to memory-copy the potentially large text value (well, as large as a paragraph or a verbatim block) as calling \$token->text would do.

Or, if you want to alter the value, you can even do things like this:

```
for ( ${ $token->text_r } ) { # Aliases it with $_ !!
```

```
s/ The / the /g; # just for example
```

```
if( 'A' eq chr(65) ) { # (if in an ASCII world)
  tr/\xA0/ /;
  tr/\xAD//d;
}
```

```
...or however you want to alter the value...
```

```
}
```

=back

You're unlikely to ever need to construct an object of this class for yourself, but if you want to, call

```
C<<
Pod::Simple::PullParserTextToken->new( I<text> )
>>
```

## NAME

perlfaq3 - Programming Tools (\$Revision: 1.38 \$, \$Date: 1999/05/23 16:08:30 \$)

## DESCRIPTION

This section of the FAQ answers questions related to programmer tools and programming support.

How do I do (anything)?

Have you looked at CPAN (see perlfaq2)? The chances are that someone has already written a module that can solve your problem. Have you read the appropriate man pages? Here's a brief index:

|                 |  |
|-----------------|--|
| Basics          | perldata, perlvar, perlsyn, perlop, perlsub  |
| Execution       | perlrun, perldebug   |
| Functions       | perlfunc   |
| Objects         | perlref, perlmod, perlobj, perltie   |
| Data Structures | perlref, perllool, perldsc   |
| Modules         | perlmod, perlmodlib, perlsub   |
| Regexes         | perlre, perlfunc, perlop, perllocale   |
| Moving to perl5 | perltrap, perl   |
| Linking w/C     | perlxs, perlcall, perlguts, perlembed  |
| Various         | <a href="http://www.perl.com/CPAN/doc/FMTEYEWTK/index.html">http://www.perl.com/CPAN/doc/FMTEYEWTK/index.html</a><br>(not a man-page but still useful) |

A crude table of contents for the Perl man page set is found in perltoc.

How can I use Perl interactively?

The typical approach uses the Perl debugger, described in the perldebug(1) man page, on an ``empty" program, like this:

```
perl -de 42
```

Now just type in any legal Perl code, and it will be immediately evaluated. You can also examine the symbol table, get stack backtraces, check variable values, set breakpoints, and other operations typically found in symbolic debuggers.

Is there a Perl shell?

In general, no. The Shell.pm module (distributed with Perl) makes Perl try commands which aren't part of the Perl language as shell commands. perlsh from the source distribution is simplistic and uninteresting, but may still be what you want.

How do I debug my Perl programs?

Have you tried use warnings or used -w? They enable warnings to detect dubious practices.

Have you tried use strict? It prevents you from

using symbolic references, makes you predeclare any subroutines that you call as bare words, and (probably most importantly) forces you to predeclare your variables with my, our, or use vars.

Did you check the return values of each and every system call? The operating system (and thus Perl) tells you whether they worked, and if not why.

```
open(FH, "> /etc/cantwrite")  
or die "Couldn't write to /etc/cantwrite: $!\n";
```

Did you read perltrap? It's full of gotchas for old and new Perl programmers and even has sections for those of you who are upgrading from languages like awk and C.

Have you tried the Perl debugger, described in perldebug? You can step through your program and see what it's doing and thus work out why what it's doing isn't what it should be doing.

How do I profile my Perl programs?

You should get the Devel::DProf module from the standard distribution (or separately on CPAN) and also use Benchmark.pm from the standard distribution. The Benchmark module lets you time specific portions of your code, while Devel::DProf gives detailed breakdowns of where your code spends its time.

Here's a sample use of Benchmark:

```

use Benchmark;
@junk = `cat /etc/motd`;
$count = 10_000;
timethese($count, {
    'map' => sub { my @a = @junk;
                  map { s/a/b/ } @a;
                  return @a
                },
    'for' => sub { my @a = @junk;
                  local $_;
                  for (@a) { s/a/b/ };
                  return @a },
});

```

This is what it prints (on one machine--your results will be dependent on your hardware, operating system, and the load on your machine):

```

Benchmark: timing 10000 iterations of for, map...
  for: 4 secs ( 3.97 usr 0.01 sys = 3.98 cpu)
  map: 6 secs ( 4.97 usr 0.00 sys = 4.97 cpu)

```

Be aware that a good benchmark is very hard to write. It only tests the data you give it and proves little about the differing complexities of contrasting algorithms.

How do I cross-reference my Perl programs?

The B::Xref module, shipped with the new, alpha-release Perl compiler (not the general distribution prior to the 5.005 release), can be used to generate cross-reference reports for Perl programs.

```
perl -MO=Xref[,OPTIONS] scriptname.plx
```

Is there a pretty-printer (formatter) for Perl?

There is no program that will reformat Perl as much as indent(1) does for C. The complex feedback between the scanner and the parser (this feedback is what confuses the vgrind and emacs programs) makes it challenging at best to write a stand-alone Perl parser.

Of course, if you simply follow the guidelines in perlstyle, you shouldn't need to reformat. The habit of formatting your code as you write it will help prevent bugs. Your editor can and should help you with this. The perl-mode or newer cperl-mode for emacs can provide remarkable amounts of help with most (but not all) code, and even less programmable editors can provide

significant assistance. Tom swears by the following settings in vi and its clones:

```

set ai sw=4
map! ^O {^M}^[O^T

```

Now put that in your .exrc file (replacing the caret characters with control characters) and away you go. In insert mode, ^T is for indenting, ^D is for undenting, and ^O is for blockdenting-- as it were. If you haven't used the last one, you're missing a lot. A more complete example, with comments, can be found at <http://www.perl.com/CPAN-local/authors/id/TOMC/scripts/toms.exrc.gz>

If you are used to using the vgrind program for printing out nice code to a laser printer, you can take a stab at this using <http://www.perl.com/CPAN/doc/misc/tips/working.vgrind.entry>, but the results are not particularly satisfying for sophisticated code.

The a2ps at <http://www.infres.enst.fr/%7Edemaille/a2ps/> does lots of things related to generating nicely printed output of documents.

Is there a ctags for Perl?

There's a simple one at <http://www.perl.com/CPAN/authors/id/TOMC/scripts/ptags.gz>

which may do the trick. And if not, it's easy to hack into what you want.

Is there an IDE or Windows Perl Editor?

Perl programs are just plain text, so any editor will do.

If you're on Unix, you already have an IDE--Unix itself. The UNIX philosophy is the philosophy of several small tools that each do one thing and do it well. It's like a carpenter's toolbox.

If you want a Windows IDE, check the following:

CodeMagicCD

<http://www.codemagiccd.com/>

Komodo

ActiveState's cross-platform, multi-language IDE has Perl support, including a regular expression debugger and remote debugging (<http://www.ActiveState.com/Products/Komodo/index.html>). (Visual Perl, a Visual Studio.NET plug-in is currently (early 2001) in beta (<http://www.ActiveState.com/Products/VisualPerl/index.html>)).

The Object System

([http://www.castlelink.co.uk/object\\_system/](http://www.castlelink.co.uk/object_system/)) is a Perl web applications development IDE.

PerlBuilder

(<http://www.solutionsoft.com/perl.htm>) is an integrated development environment for Windows that supports Perl development.

Perl code magic

(<http://www.petes-place.com/codemagic.html>).

visiPerl+

<http://helpconsulting.net/visiperl/>, from Help Consulting.

For editors: if you're on Unix you probably have vi or a vi clone already, and possibly an emacs too, so you may not need to download anything. In any emacs the cperl-mode (M-x cperl-mode) gives you perhaps the best available Perl editing mode in any editor.

For Windows editors: you can download an Emacs

GNU Emacs

<http://www.gnu.org/software/emacs/windows/ntemacs.html>

MicroEMACS

<http://members.nbc.com/uemacs/>

XEmacs

<http://www.xemacs.org/Download/index.html>

or a vi clone such as

Elvis

<ftp://ftp.cs.pdx.edu/pub/elvis/> <http://www.fh-wedel.de/elvis/>

Vile

<http://vile.cx/>

Vim

<http://www.vim.org/>

win32: <http://www.cs.vu.nl/%7Etmgil/vi.html>

For vi lovers in general, Windows or elsewhere: <http://www.thomer.com/thomer/vi/vi.html>.

nvi (<http://www.bostic.com/vi/>, available from CPAN in `src/misc/`) is yet another vi clone, unfortunately not available for Windows, but in UNIX platforms you might be interested in trying it out, firstly because strictly speaking it is not a vi clone, it is the real vi, or the new incarnation of it, and secondly because you can embed Perl inside it to use Perl as the scripting language. nvi is not alone in this, though: at least also vim and vile offer an embedded Perl.

The following are Win32 multilanguage editor/IDESs that support Perl:

Codewright

<http://www.starbase.com/>

MultiEdit

<http://www.MultiEdit.com/>

SlickEdit

<http://www.slickedit.com/>

There is also a `toyedit` Text widget based editor written in Perl that is distributed with the Tk module on CPAN. The `ptkdb` (<http://world.std.com/~aep/ptkdb/>) is a Perl/tk based debugger that acts as a development environment of sorts. Perl Composer (<http://perlcomposer.sourceforge.net/vperl.html>) is an IDE for Perl/Tk GUI creation.

In addition to an editor/IDE you might be interested in a more powerful shell environment for Win32. Your options include

Bash

from

the Cygwin package (<http://sources.redhat.com/cygwin/>)

Ksh

from the MKS Toolkit (<http://www.mks.com/>), or the Bourne shell of the U/WIN environment

(<http://www.research.att.com/sw/tools/uwin/>)

Tcsh

<ftp://ftp.astron.com/pub/tcsh/>, see also <http://www.primite.wisc.edu/software/csh-tcsh-book/>

Zsh

<ftp://ftp.blarg.net/users/amol/zsh/>, see also <http://www.zsh.org/>

MKS and U/WIN are commercial (U/WIN is free for educational and research purposes), Cygwin is covered by the GNU Public License (but that shouldn't matter for Perl use). The Cygwin, MKS, and U/WIN all contain (in addition to the shells) a comprehensive set of standard UNIX toolkit utilities.

If you're transferring text files between Unix and Windows using FTP be sure to transfer them in ASCII mode so the ends of lines are appropriately converted.

On Mac OS the MacPerl Application comes with a simple 32k text editor that behaves like a rudimentary IDE. In contrast to the MacPerl Application the MPW Perl tool can make use of

the MPW Shell itself as an editor (with no 32k limit).

BEdit and BEdit Lite

are text editors for Mac OS that have a Perl sensitivity mode (<http://web.barebones.com/>).

Alpha

is an editor, written and extensible in Tcl, that nonetheless has built in support for several popular markup and programming languages including Perl and HTML (<http://alpha.olm.net/>).

Pepper and Pe are programming language sensitive text editors for Mac OS X and BeOS respectively

(<http://www.hekkelman.com/>).

Where can I get Perl macros for vi?

For a complete version of Tom Christiansen's vi configuration file, see

[http://www.perl.com/CPAN/authors/Tom\\_Christiansen/scripts/toms.exrc.gz](http://www.perl.com/CPAN/authors/Tom_Christiansen/scripts/toms.exrc.gz), the standard benchmark file for vi emulators. The file runs best with `nvi`, the current version of vi out of Berkeley, which incidentally can be built with an embedded Perl interpreter--see <http://www.perl.com/CPAN/src/misc>.

Where can I get perl-mode for emacs?

Since Emacs version 19 patchlevel 22 or so, there have been both a `perl-mode.el`

and support for the Perl debugger built in. These should come with the standard Emacs 19 distribution.

In the Perl source directory, you'll find a directory called "emacs", which contains a `cperl-mode` that color-codes keywords, provides context-sensitive help, and other nifty things.

Note that the `perl-mode` of emacs will have fits with "main'foo" (single quote), and mess up the indentation and highlighting. You are probably using "main::foo" in new Perl code anyway, so this shouldn't be an issue.

How can I use curses with Perl?

The Curses module from CPAN provides a dynamically loadable object module interface to a curses library. A

small demo can be found at the directory [http://www.perl.com/CPAN/authors/Tom\\_Christiansen/scripts/rep](http://www.perl.com/CPAN/authors/Tom_Christiansen/scripts/rep); this program repeats a command and updates the screen as needed, rendering `rep ps axu` similar to `top`.

How can I use X or Tk with Perl?

Tk is a completely Perl-based, object-oriented interface to the Tk toolkit that doesn't force you to use Tcl just to get at Tk. Sx is an interface to the Athena Widget set. Both are available from CPAN. See the directory [http://www.perl.com/CPAN/modules/by-category/08\\_User\\_Interfaces/](http://www.perl.com/CPAN/modules/by-category/08_User_Interfaces/)

Invaluable for Perl/Tk programming are the Perl/Tk FAQ at <http://w4.lns.cornell.edu/%7Epvhp/ptk/ptkTOC.html> , the Perl/Tk Reference Guide available at [http://www.perl.com/CPAN-local/authors/Stephen\\_O\\_Lidie/](http://www.perl.com/CPAN-local/authors/Stephen_O_Lidie/) , and the online manpages at <http://www-users.cs.umn.edu/%7Eamundson/perl/perlTk/toc.html> .

How can I generate simple menus without using CGI or Tk?

The <http://www.perl.com/CPAN/authors/id/SKUNZ/perlmenu.v4.0.tar.gz> module, which is curses-based, can help with this.

What is undump?

See the next question on "How can I make my Perl program run faster?"

How can I make my Perl program run faster?

The best way to do this is to come up with a better algorithm. This can often make a dramatic difference. Jon Bentley's book "Programming Pearls" (that's not a misspelling!) has some good tips on optimization, too. Advice on benchmarking boils down to: benchmark and profile to make sure you're optimizing the right part, look for better algorithms instead of microtuning your code, and when all else fails consider just buying faster hardware.

A different approach is to autoload seldom-used Perl code. See the `AutoSplit` and `AutoLoader` modules in the standard distribution for that. Or you could locate the bottleneck and think about writing just that part in C, the way we used to take bottlenecks in C code and write them in assembler. Similar to rewriting in C, modules that have critical sections can be written in C (for instance, the `PDL` module from CPAN).

In some cases, it may be worth it to use the backend compiler to produce byte code (saving compilation time) or compile into C, which will certainly save compilation time and sometimes a small amount (but not much) execution time. See the question about compiling your Perl programs for more on the compiler--the wins aren't as obvious as you'd hope.

If

you're currently linking your perl executable to a shared `libc.so`, you can often gain a 10-25% performance benefit by rebuilding it to link with a static `libc.a` instead. This will make a bigger perl executable, but your Perl programs (and programmers) may thank you for it. See the `INSTALL` file in the source distribution for more information. Unsubstantiated reports allege that Perl interpreters that use `sfio` outperform those that don't (for I/O intensive applications). To try this, see the `INSTALL` file in the source distribution, especially the "Selecting File I/O mechanisms" section.

The `undump` program was an old attempt to speed up your Perl program by storing the already-compiled form to disk. This is no longer a viable option, as it only worked on a few architectures, and wasn't a good solution anyway.

How can I make my Perl program take less memory?

When it comes to time-space tradeoffs, Perl nearly always prefers to throw memory at a problem. Scalars in Perl use more memory than

strings in C, arrays take more than that, and hashes use even more. While there's still a lot to be done, recent releases have been addressing these issues. For example, as of 5.004, duplicate hash keys are shared amongst all hashes using them, so require no reallocation.

In some cases, using `substr()` or `vec()` to simulate arrays can be highly beneficial. For example, an array of a thousand booleans will take at least 20,000 bytes of space, but it can be turned into one 125-byte bit vector--a considerable memory savings. The standard `Tie::SubstrHash` module can also help for certain types of data structure. If you're working with specialist data structures (matrices, for instance) modules that implement these in C may use less memory than equivalent Perl modules.

Another thing to try is learning whether your Perl was compiled with the system `malloc` or with Perl's builtin `malloc`.

Whichever one it is, try using the other one and see whether this makes a difference. Information about malloc is in the INSTALL file in the source distribution. You can find out whether you are using perl's malloc by typing `perl -V:usemymalloc`.

Is it unsafe to return a pointer to local data?

No, Perl's garbage collection system takes care of this.

```
sub makeone {
    my @a = ( 1 .. 10 );
    return \@a;
}
for $i ( 1 .. 10 ) {
    push @many, makeone();
}
print $many[4][5], "\n";
print "@many\n";
```

How can I free an array or hash so my program shrinks?

You can't. On most operating systems, memory allocated to a program can never be returned to the system. That's why long-running programs sometimes re-exec themselves. Some operating systems (notably, FreeBSD and Linux) allegedly reclaim large chunks of memory that is no longer used, but it doesn't appear to happen with Perl (yet). The Mac appears to be the only platform that will reliably (albeit, slowly) return memory to the OS.

We've had reports that on Linux (Redhat 5.1) on Intel, `undef $scalar` will return memory to the system, while on Solaris 2.6 it won't. In general, try it yourself and see.

However, judicious use of `my()` on your variables will help make sure that they go out of scope so that Perl can free up that space for use in other parts of your program. A global variable, of course, never goes out of scope, so you can't get its space automatically reclaimed, although `undef()`ing and/or `delete()`ing it will achieve the same effect. In general, memory allocation and de-allocation isn't something you can or should be worrying about much in Perl, but even this capability (preallocation of data types) is in the works.

How can I make my CGI script more efficient?

Beyond the normal measures described to make general Perl programs faster or smaller, a CGI program has additional issues. It may be run several times per second. Given that each time it runs it will need to be re-compiled and will often allocate a megabyte or more of system memory, this can be a killer. Compiling into C isn't going to help you because the process start-up overhead is where the bottleneck is.

There are two popular ways to avoid this overhead. One solution involves running the Apache HTTP server (available from <http://www.apache.org/>) with either of the `mod_perl` or `mod_fastcgi` plugin modules.

With `mod_perl` and the `Apache::Registry` module (distributed with `mod_perl`), `httpd` will run with an embedded Perl interpreter which pre-compiled your script and then executes it within the same address space without forking. The Apache extension also gives Perl access to the internal server API, so modules written in Perl can do just about anything a module written in C can. For more on `mod_perl`, see <http://perl.apache.org/>

With the `FCGI` module (from CPAN) and the `mod_fastcgi` module (available from <http://www.fastcgi.com/>) each of your Perl programs becomes a permanent CGI daemon process.

Both of these solutions can have far-reaching effects on your system and on the way you write your CGI programs, so investigate them with care.

See [http://www.perl.com/CPAN/modules/by-category/15\\_World\\_Wide\\_Web\\_HTML\\_HTTP\\_CGI/](http://www.perl.com/CPAN/modules/by-category/15_World_Wide_Web_HTML_HTTP_CGI/).

A non-free, commercial product, "The Velocity Engine for Perl", (<http://www.binevolve.com/> or <http://www.binevolve.com/velocigen/>) might also be worth looking at. It will allow you to increase the performance of your Perl programs, running programs up to 25 times faster than normal CGI Perl when running in persistent Perl mode or 4 to 5 times faster without any modification to your existing CGI programs. Fully functional evaluation copies are available from the web site.

How can I hide the source for my Perl program?

Delete it. :-) Seriously, there are a number of (mostly unsatisfactory) solutions with varying levels of "security". First of all, however, you can't take away read permission, because the source code has to be readable in order to be compiled and interpreted. (That doesn't mean that a CGI script's source is readable by people on the web, though-- only by people

with access to the filesystem.) So you have to leave the permissions at the socially friendly 0755 level.

Some people regard this as a security problem. If your program does insecure things and relies on people not knowing how to exploit those insecurities, it is not secure. It is often possible for someone to determine the insecure things and exploit them without viewing the source. Security through obscurity, the name for hiding your bugs instead of fixing them, is little security indeed.

You can try using encryption via source filters (Filter::\* from CPAN), but any decent programmer will be able to decrypt it. You can try using the byte code compiler and interpreter described below, but the curious might still be able to de-compile it. You can try using the native-code compiler described below, but crackers might be able to disassemble it. These pose varying degrees of difficulty to people wanting to get at your code, but none can definitively conceal it (true of every language, not just Perl).

If you're concerned about people profiting from your code, then the bottom line is that nothing but a restrictive license will give you legal security. License your software and pepper it with threatening statements like "This is unpublished proprietary software of XYZ Corp. Your access to it does not give you permission to use it blah blah blah." We are not lawyers, of course, so you should see a lawyer if you want to be sure your license's wording will stand up in court.

How can I compile my Perl program into byte code or C?

Malcolm Beattie has written a multifunction backend compiler, available from CPAN, that can do both these things. It is included in the perl5.005 release, but is still considered experimental. This means it's fun to play with if you're a programmer but not really for people looking for turn-key solutions.

Merely compiling into C does not in and of itself guarantee that your code will run very much faster. That's because except for lucky cases where

a lot of native type inferencing is possible, the normal Perl run-time system is still present and so your program will take just as long to run and be just as big. Most programs save little more than compilation time, leaving execution no more than 10-30% faster. A few rare programs actually benefit significantly (even running several times faster), but this takes some tweaking of your code.

You'll probably be astonished to learn that the current version of the compiler generates a compiled form of your script whose executable is just as big as the original perl executable, and then some. That's because as currently written, all programs are prepared for a full eval() statement. You can tremendously reduce this cost by building a shared libperl.so library and linking against that. See the INSTALL podfile in the Perl source distribution for details. If you link your main perl binary with this, it will make it minuscule. For example, on one author's system, /usr/bin/perl is only 11k in size!

In general, the compiler will do nothing to make a Perl program smaller, faster, more portable, or more secure. In fact, it can make your situation worse. The executable will be bigger, your VM system may take longer to load the whole thing, the binary is fragile and hard to fix, and compilation never stopped software piracy in the form of crackers, viruses, or bootleggers. The real advantage of the compiler is merely packaging, and once you see the size of what it makes (well, unless you use a shared libperl.so), you'll probably want a complete Perl install anyway.

How can I compile Perl into Java?

You can also integrate Java and Perl with the Perl Resource Kit from O'Reilly and Associates. See <http://www.oreilly.com/catalog/prkunix/>.

Perl 5.6 comes with Java Perl Lingo, or JPL. JPL, still in development, allows Perl code to be called from Java. See [jpl/README](#) in the Perl source tree.

How can I get #!perl to work on [MS-DOS,NT,...]?

For OS/2 just use

```
extproc perl -S -your_switches
```

as

the first line in \*.cmd file (-S due to a bug in cmd.exe's `extproc' handling). For DOS one should first invent a corresponding batch file and codify it in ALTERNATIVE\_SHEBANG (see the INSTALL file in the source distribution for more information).

The Win95/NT installation, when using the ActiveState port of Perl, will modify the Registry to associate the .pl extension with the perl interpreter. If you install another port, perhaps even building your own Win95/NT Perl from the standard sources by using a Windows port of gcc (e.g., with cygwin or mingw32), then you'll have to modify the Registry yourself. In addition to associating .pl with the interpreter, NT people can use: SET

```
PATHEXT=%PATHEXT%;PL
```

to let them run the program install-linux.pl merely by typing install-linux.

Macintosh Perl programs will have the appropriate Creator and Type, so that double-clicking them will invoke the Perl application.

**IMPORTANT!:** Whatever you do, PLEASE don't get frustrated, and just throw

the perl interpreter into your cgi-bin directory, in order to get your programs working for a web server. This is an EXTREMELY big security risk. Take the time to figure out how to do it correctly.

Can I write useful Perl programs on the command line?

Yes. Read perlrun for more information. Some examples follow. (These assume standard Unix shell quoting rules.)

```
# sum first and last fields
perl -lane 'print $F[0] + $F[-1]' *
# identify text files
perl -le 'for(@ARGV) {print if -f && -T _}' *
# remove (most) comments from C program
perl -0777 -pe 's{/\*.*?/*}/}gs' foo.c
# make file a month younger than today, defeating reaper daemons
perl -e '$X=24*60*60; utime(time(),time() + 30 * $X,@ARGV)' *
# find first unused uid
perl -le '$i++ while getpwuid($i); print $i'
# display reasonable manpath
echo $PATH | perl -nl -072 -e '
    s![^/+]*$!man!&&-d&&!$s{$_}++&&push@m,$_;END{print"@m"}'
```

OK, the last one was actually an Obfuscated Perl Contest

entry. :-)

Why don't Perl one-liners work on my DOS/Mac/VMS system?

The problem is usually that the command interpreters on those systems have rather different ideas about quoting than the Unix shells under which the one-liners were created. On some systems, you may have to change single-quotes to double ones, which you must NOT do on Unix or Plan9 systems. You might also have to change a single % to a %%.

For example:

```
# Unix
perl -e 'print "Hello world\n"'
# DOS, etc.
perl -e "print \"Hello world\n\""
# Mac
print "Hello world\n"
(then Run "Myscript" or Shift-Command-R)
# VMS
```

```
perl -e "print ""Hello world\n"""
```

The problem is that none of these examples are reliable: they depend on the command interpreter. Under Unix, the first two often work. Under DOS, it's entirely possible that neither works. If 4DOS was the command shell, you'd probably have better luck like this:

```
perl -e "print <Ctrl-x>"Hello world\n<Ctrl-x>"
```

Under the Mac, it depends

which environment you are using. The MacPerl shell, or MPW, is much like Unix shells in its support for several quoting variants, except that it makes free use of the Mac's non-ASCII characters as control characters.

Using qq(), q(), and qx(), instead of "double quotes", 'single quotes', and `backticks`, may make one-liners easier to write.

There is no general solution to all of this. It is a mess, pure and simple. Sucks to be away from Unix, huh? :-)

[Some of this answer was contributed by Kenneth Albanowski.]

Where can I learn about CGI or Web programming in Perl?

For modules, get the CGI or LWP modules from CPAN. For textbooks, see the two especially dedicated to web stuff in the question on books. For problems and questions related to the web, like ``Why do I get 500 Errors" or ``Why doesn't it run from the browser right when it runs fine on the command line", see these sources:

WWW Security FAQ

CGI Security FAQ

<http://www.go2net.com/people/paulp/cgi-security/safe-cgi.txt>

Where can I learn about object-oriented Perl programming?

A good place to start is perltoot, and you can use perlobj, perlboot, and perlbot for reference. Perltoot didn't come out until the 5.004 release; you can get a copy (in pod, html, or postscript) from

<http://www.perl.com/CPAN/doc/FMTEYEWTK/>.

Where can I learn about linking C with Perl? [h2xs, xsubpp]

If you want to call C from Perl, start with perlxsstut, moving on to perlxs, xsubpp, and perlguts. If you want to call Perl from C, then read perlembed, perllcall, and perlguts. Don't forget that you can learn a lot from looking at how the authors of existing extension modules

wrote their code and solved their problems.

I've read perlembed, perlguts, etc., but I can't embed perl in my C program; what am I doing wrong?

Download the ExtUtils::Embed kit from CPAN and run `make test'. If the tests pass, read the pods again and again and again. If they fail, see perlbug and send a bug report with the output of make test TEST\_VERBOSE=1 along with perl -V.

When I tried to run my script, I got this message. What does it mean?

A complete list of Perl's error messages and warnings with explanatory text can be found in perldiag. You can also use the splain program (distributed with Perl) to explain the error messages:

```
perl program 2>diag.out
```

splain [-v] [-p] diag.out  
or change your program to explain the messages for you:  
use diagnostics;  
or  
use diagnostics -verbose;

What's MakeMaker?

This module (part of the standard Perl distribution) is designed to write a Makefile for an extension module from a Makefile.PL. For more information, see ExtUtils::MakeMaker.

=head1 Pod::Simple version 3.28

Pod::Simple is a Perl library for parsing text in the Pod ("plain old documentation") markup language that is typically used for writing documentation for Perl and for Perl modules. The Pod format is explained L<perlpod>; the most common formatter is called C<perldoc>.

Pod formatters can use Pod::Simple to parse Pod documents and render them into plain text, HTML, or any number of other formats.

=head2 Installation

To install this module, type the following:

```
perl Makefile.PL
make
make test
make install
```

=head2 Support

Questions or discussion about POD and Pod::Simple should be sent to the pod-people@perl.org mail list. Send an empty email to pod-people-subscribe@perl.org to subscribe.

This module is managed in an open GitHub repository,  
L<<https://github.com/theory/pod-simple/>>. Feel free to fork and contribute, or  
to clone L<<git://github.com/theory/pod-simple.git>>  
and send patches!

Patches against Pod::Simple are welcome. Please send bug reports to

=head1 NAME

Pod::Simple::Checker -- check the Pod syntax of a document

=head1 SYNOPSIS

```
perl -MPod::Simple::Checker -e \  
"exit Pod::Simple::Checker->filter(shift)->any_errata_seen" \  
thingy.pod
```

=head1 DESCRIPTION

This class is for checking the syntactic validity of Pod.  
It works by basically acting like a simple-minded version of  
L<Pod::Simple::Text> that formats only the "Pod Errors" section  
(if Pod::Simple even generates one for the given document).

This is a subclass of L<Pod::Simple> and inherits all its methods.

=head1 NAME

Pod::Simple - framework for parsing Pod

=head1 SYNOPSIS

TODO

=head1 DESCRIPTION

Pod::Simple is a Perl library for parsing text in the Pod ("plain old documentation") markup language that is typically used for writing documentation for Perl and for Perl modules. The Pod format is explained L<perlpod>; the most common formatter is called C<perldoc>.

Be sure to read L<ENCODING> if your Pod contains non-ASCII characters.

Pod formatters can use Pod::Simple to parse Pod documents and render them into plain text, HTML, or any number of other formats. Typically, such formatters will be subclasses of Pod::Simple, and so they will inherit its methods, like C<parse\_file>.

If you're reading this document just because you have a Pod-processing subclass that you want to use, this document (plus the documentation for the subclass) is probably all you need to read.

If you're reading this document because you want to write a formatter subclass, continue reading it and then read L<Pod::Simple::Subclassing>, and then possibly even read L<perlpodspec> (some of which is for parser-writers, but much of which is notes to formatter-writers).

=head1 MAIN METHODS

=over

=item C<< \$parser = I<SomeClass>->new(); >>

This returns a new parser object, where I<C<SomeClass>> is a subclass of Pod::Simple.

=item C<< \$parser->output\_fh( \*OUT ); >>

This sets the filehandle that C<\$parser>'s output will be written to. You can pass C<\*STDOUT>, otherwise you should probably do something like this:

```
my $outfile = "output.txt";
open TXTOUT, ">$outfile" or die "Can't write to $outfile: $!";
$parser->output_fh(*TXTOUT);
```

...before you call one of the C<< \$parser->parse\_I<whatever> >> methods.

=item C<< \$parser->output\_string( \somestring ); >>

This sets the string that C<\$parser>'s output will be sent to, instead of any filehandle.

=item C<< \$parser->parse\_file( I<\$some\_filename> ); >>

=item C<<  
\$parser->parse\_file( \*INPUT\_FH ); >>

This reads the Pod content of the file (or filehandle) that you specify, and processes it with that C<\$parser> object, according to however C<\$parser>'s class works, and according to whatever parser options you have set up for this C<\$parser> object.

```
=item C<< $parser->parse_string_document( I<$all_content> ); >>
```

This works just like C<parse\_file> except that it reads the Pod content not from a file, but from a string that you have already in memory.

```
=item C<< $parser->parse_lines( I<...@lines...>, undef ); >>
```

This processes the lines in C<@lines> (where each list item must be a defined value, and must contain exactly one line of content -- so no items like C<"foo\nbar"> are allowed). The final C<undef> is used to indicate the end of document being parsed.

The other C<parser\_I<whatever>> methods are meant to be called only once per C<\$parser> object; but C<parse\_lines> can be called as many times per C<\$parser> object as you want, as long as the last call (and only the last call) ends with an C<undef> value.

```
=item C<< $parser->content_seen >>
```

This returns true only if there has been any real content seen for this document. Returns false in cases where the document contains content, but does not make use of any Pod markup.

```
=item C<< I<SomeClass>->filter( I<$filename> ); >>
```

```
=item C<< I<SomeClass>->filter( I<*INPUT_FH> ); >>
```

```
=item C<< I<SomeClass>->filter( I<\$document_content> ); >>
```

This is a shortcut method for creating a new parser object, setting the output handle to STDOUT, and then processing the specified file (or filehandle, or in-memory document). This is handy for one-liners like this:

```
perl -MPod::Simple::Text -e "Pod::Simple::Text->filter('thingy.pod')"
```

```
=back
```

## =head1 SECONDARY METHODS

Some of these methods might be of interest to general users, as well as of interest to formatter-writers.

Note that the general pattern here is that the accessor-methods read the attribute's value with `C<< $value = $parser->I<attribute>`

`>>`

and set the attribute's value with

`C<< $parser->I<attribute>(I<newvalue>) >>`. For each accessor, I typically only mention one syntax or another, based on which I think you are actually most likely to use.

=over

=item `C<< $parser->parse_characters( I<SOMEVALUE> ) >>`

The Pod parser normally expects to read octets and to convert those octets to characters based on the `C<=encoding>` declaration in the Pod source. Set this option to a true value to indicate that the Pod source is already a Perl character stream. This tells the parser to ignore any `C<=encoding>` command and to skip all the code paths involving decoding octets.

=item `C<< $parser->no_whining( I<SOMEVALUE> ) >>`

If you set this attribute to a true value, you will suppress the parser's complaints about irregularities in the Pod coding. By default, this attribute's value is false, meaning that irregularities will be reported.

Note that turning this attribute to true won't suppress one or two kinds of complaints about rarely occurring unrecoverable errors.

=item `C<< $parser->no_errata_section( I<SOMEVALUE> ) >>`

If you set this attribute to a true value, you will stop the parser from generating a "POD ERRORS" section at the end of the document. By default, this attribute's value is false, meaning that an errata section will be generated, as necessary.

=item `C<< $parser->complain_stderr( I<SOMEVALUE> ) >>`

If you set this attribute to a true value, it will send reports of parsing errors to `STDERR`. By default, this attribute's value is false, meaning that no output is sent to `STDERR`.

Setting `C<complain_stderr>` also sets `C<no_errata_section>`.

=item C<< \$parser->source\_filename >>

This returns the filename that this parser object was set to read from.

=item C<< \$parser->doc\_has\_started >>

This returns true if C<\$parser> has read from a source, and has seen Pod content in it.

=item C<< \$parser->source\_dead >>

This returns true if C<\$parser> has read from a source, and come to the end of that source.

=item C<< \$parser->strip\_verbatim\_indent( I<SOMEVALUE> ) >>

The perlpod spec for a Verbatim paragraph is "It should be reproduced exactly...", which means that the whitespace you've used to indent your verbatim blocks will be preserved in the output. This can be annoying for outputs such as HTML, where that whitespace will remain in front of every line. It's an unfortunate case where syntax is turned into semantics.

If the POD your parsing adheres to a consistent indentation policy, you can have such indentation stripped from the beginning of every line of your verbatim blocks. This method tells Pod::Simple what to strip. For two-space indents, you'd use:

```
$parser->strip_verbatim_indent(' ');
```

For tab indents, you'd use a tab character:

```
$parser->strip_verbatim_indent("\t");
```

If the POD is inconsistent about the indentation of verbatim blocks, but you have figured out a heuristic to determine how much a particular verbatim block is indented, you can pass

a code reference instead. The code reference will be executed with one argument, an array reference of all the lines in the verbatim block, and should return the value to be stripped from each line. For example, if you decide that you're fine to use the first line of the verbatim block to set the standard for indentation of the rest of the block, you can look at the first line and return the appropriate value, like so:

```
$new->strip_verbatim_indent(sub {  
    my $lines = shift;
```

```

(my $indent = $lines->[0]) =~ s/\S.*//;
return $indent;
});

```

If you'd rather treat each line individually, you can do that, too, by just transforming them in-place in the code reference and returning C<undef>. Say that you don't want I<any> lines indented. You can do something like this:

```

$new->strip_verbatim_indent(sub {
    my $lines = shift;
    sub { s/^\s+// for @{$lines} },
    return undef;
});

```

=back

=head1 TERTIARY METHODS

=over

=item C<< \$parser->abandon\_output\_fh() >>X<abandon\_output\_fh>

Cancel

output to the file handle. Any POD read by the C<\$parser> is not effected.

=item C<< \$parser->abandon\_output\_string() >>X<abandon\_output\_string>

Cancel output to the output string. Any POD read by the C<\$parser> is not effected.

=item C<< \$parser->accept\_code( @codes ) >>X<accept\_code>

Alias for L<< accept\_codes >>.

=item C<< \$parser->accept\_codes( @codes ) >>X<accept\_codes>

Allows C<\$parser> to accept a list of L<perlpod/Formatting Codes>. This can be used to implement user-defined codes.

=item C<< \$parser->accept\_directive\_as\_data( @directives ) >>X<accept\_directive\_as\_data>

Allows C<\$parser> to accept a list of directives for data paragraphs. A directive is the label of a L<perlpod/Command Paragraph>. A data paragraph is one delimited by C<< =begin/=for/=end >> directives. This can be used to implement user-defined directives.

=item C<< \$parser->accept\_directive\_as\_processed( @directives ) >>X<accept\_directive\_as\_processed>

Allows C<\$parser> to accept a list of directives for processed paragraphs. A directive is the label of a L<perlpod/Command Paragraph>. A processed paragraph is also known as L<perlpod/Ordinary Paragraph>. This can be used to implement user-defined directives.

=item C<< \$parser->accept\_directive\_as\_verbatim( @directives ) >>X<accept\_directive\_as\_verbatim>

Allows C<\$parser> to accept a list of directives for L<perlpod/Verbatim Paragraph>. A directive is the label of a L<perlpod/Command Paragraph>. This can be used to implement user-defined directives.

=item C<< \$parser->accept\_target( @targets ) >>X<accept\_target>

Alias for L<< accept\_targets >>.

=item C<< \$parser->accept\_target\_as\_text( @targets ) >>X<accept\_target\_as\_text>

Alias for L<< accept\_targets\_as\_text >>.

=item C<< \$parser->accept\_targets( @targets ) >>X<accept\_targets>

Accepts targets for C<< =begin/=for/=end >> sections of the POD.

=item C<< \$parser->accept\_targets\_as\_text( @targets ) >>X<accept\_targets\_as\_text>

Accepts targets for C<< =begin/=for/=end >> sections that should be parsed as POD. For details, see L<< perlpodspec/About Data Paragraphs >>.

=item C<< \$parser->any\_errata\_seen() >>X<any\_errata\_seen>

Used to check if any errata was seen.

I<Example:>

```
die "too many errors\n" if $parser->any_errata_seen();
```

=item C<< \$parser->detected\_encoding() >>X<detected\_encoding>

Return the encoding corresponding to C<< =encoding >>, but only if the encoding was recognized and handled.

=item C<< \$parser->encoding() >>X<encoding>

Return encoding of the document, even if the encoding is not correctly handled.

=item C<< \$parser->parse\_from\_file( \$source, \$to ) >>X<parse\_from\_file>

Parses from C<\$source> file to C<\$to> file. Similar to L<< Pod::Parser/parse\_from\_file >>.

=item C<< \$parser->scream( @error\_messages ) >>X<scream>

Log an error that can't be ignored.

=item C<< \$parser->unaccept\_code( @codes ) >>X<unaccept\_code>

Alias for L<< unaccept\_codes >>.

=item C<< \$parser->unaccept\_codes( @codes ) >>X<unaccept\_codes>

Removes  
C<< @codes >> as valid codes for the parse.

=item C<< \$parser->unaccept\_directive( @directives ) >>X<unaccept\_directive>

Alias for L<< unaccept\_directives >>.

=item C<< \$parser->unaccept\_directives( @directives ) >>X<unaccept\_directives>

Removes C<< @directives >> as valid directives for the parse.

=item C<< \$parser->unaccept\_target( @targets ) >>X<unaccept\_target>

Alias for L<< unaccept\_targets >>.

=item C<< \$parser->unaccept\_targets( @targets ) >>X<unaccept\_targets>

Removes C<< @targets >> as valid targets for the parse.

=item C<< \$parser->version\_report() >>X<version\_report>

Returns a string describing the version.

=item C<< \$parser->whine( @error\_messages ) >>X<whine>

Log an error unless C<< \$parser->no\_whining( TRUE ); >>.

=back

=head1 ENCODING

The Pod::Simple parser expects to read B<octets>. The parser will decode the

octets into Perl's internal character string representation using the value of the C<=<encoding> declaration in the POD source.

If

the POD source does not include an C<=<encoding> declaration, the parser will attempt to guess the encoding (selecting one of UTF-8 or Latin-1) by examining the first non-ASCII bytes and applying the heuristic described in L<perlpodspec>.

If you set the C<parse\_characters> option to a true value the parser will expect characters rather than octets; will ignore any C<=<encoding>; and will make no attempt to decode the input.

=head1 CAVEATS

This is just a beta release -- there are a good number of things still left to do. Notably, support for EBCDIC platforms is still half-done, an untested.

=head1 NAME

Pod::Simple::Debug -- put Pod::Simple into trace/debug mode

## =head1 SYNOPSIS

```
use Pod::Simple::Debug (5); # or some integer
```

Or:

```
my $debuglevel;
use Pod::Simple::Debug (\$debuglevel, 0);
..some stuff that uses Pod::Simple to do stuff, but which
you don't want debug output from...
```

```
$debug_level = 4;
..some stuff that uses Pod::Simple to do stuff, but which
you DO want debug output from...
```

```
$debug_level = 0;
```

## =head1 DESCRIPTION

This is an internal module for controlling the debug level (a.k.a. trace level) of Pod::Simple. This is of interest only to Pod::Simple developers.

## =head1 CAVEATS

Note that you should load this module I<before> loading Pod::Simple (or any Pod::Simple-based class). If you try loading Pod::Simple::Debug after &Pod::Simple::DEBUG is already defined, Pod::Simple::Debug will throw a fatal error to the effect that "it's s too late to call Pod::Simple::Debug".

Note that the C<use Pod::Simple::Debug (\\$x, I<somenum>)> mode will make Pod::Simple (et al) run rather slower, since &Pod::Simple::DEBUG won't be a constant sub anymore, and so Pod::Simple (et al) won't compile with constant-folding.

## =head1 GUTS

Doing this:

```
use Pod::Simple::Debug (5); # or some integer
```

is basically equivalent to:

```
BEGIN { sub Pod::Simple::DEBUG () {5} } # or some integer
```

```
use Pod::Simple ();
```

And this:

```
use Pod::Simple::Debug (\$debug_level,0); # or some integer
```

is basically equivalent to this:

```
my $debug_level;
BEGIN { $debug_level = 0 }
BEGIN { sub Pod::Simple::DEBUG () { $debug_level } }
use Pod::Simple ();
```

=head1 NAME

perlfaq3 - Programming Tools (\$Revision: 1.38 \$, \$Date: 1999/05/23 16:08:30 \$)

=head1 DESCRIPTION

This section of the FAQ answers questions related to programmer tools  
and programming support.

=head2 How do I do (anything)?

Have you looked at CPAN (see L<perlfaq2>)? The chances are that someone has already written a module that can solve your problem. Have you read the appropriate man pages? Here's a brief index:

Basics     perldata, perlvar, perlsyn, perlop, perlsub  
Execution perlrun, perldebug  
Functions perlfunc  
Objects   perlref, perlmod, perlobj, perltie  
Data Structures perlref, perllo, perlisc  
Modules   perlmod, perlmodlib, perlsub  
Regexes   perlre, perlfunc, perlop, perllocale  
Moving to perl5 perltrap, perl  
Linking w/C perlxs, perlcall, perlguts, perlembed  
Various   <http://www.perl.com/CPAN/doc/FMTEYEWTK/index.html>  
(not a man-page but still useful)

A crude table of contents for the Perl man page set is found in L<perltoc>.

=head2 How can I use Perl interactively?

The typical approach uses the Perl debugger, described in the perldebug(1) man page, on an ``empty" program, like this:

```
perl -de 42
```

Now just type in any legal Perl code, and it will be immediately evaluated. You can also examine the symbol table, get stack backtraces, check variable values, set breakpoints, and other operations typically found in symbolic debuggers.

=head2 Is there a Perl shell?

In general, no. The Shell.pm module (distributed with Perl) makes Perl try commands which aren't part of the Perl language as shell commands. perlsh from the source distribution is simplistic and uninteresting, but may still be what you want.

=head2 How do I debug my Perl programs?

Have you tried C<use warnings> or used C<-w>? They enable warnings to detect dubious practices.

Have you tried C<use strict>? It prevents you from using symbolic references, makes you predeclare any subroutines that you call as bare words, and (probably most importantly) forces you to predeclare your

variables with C<my>, C<our>, or C<use vars>.

Did you check the return values of each and every system call? The operating system (and thus Perl) tells you whether they worked, and if not why.

```
open(FH, "> /etc/cantwrite")
  or die "Couldn't write to /etc/cantwrite: $!\n";
```

Did you read L<perltrap>? It's full of gotchas for old and new Perl programmers and even has sections for those of you who are upgrading from languages like I<awk> and I<C>.

Have you tried the Perl debugger, described in L<perldebug>? You can step through your program and see what it's doing and thus work out why what it's doing isn't what it should be doing.

=head2 How do I profile my Perl programs?

You should get the Devel::DProf module from the standard distribution (or separately on CPAN) and also use Benchmark.pm from the standard distribution. The Benchmark module lets you time specific portions of your code, while Devel::DProf gives detailed breakdowns of where your code spends its time.

Here's a sample use of Benchmark:

```
use Benchmark;

@junk = `cat /etc/motd`;
$count = 10_000;

timethese($count, {
    'map' => sub { my @a = @junk;
        map { s/a/b/ } @a;
        return @a
    },
    'for' => sub { my @a = @junk;
        local $_;
        for (@a) { s/a/b/ };
        return @a },
    });
```

This is what it prints (on one machine--your results will be dependent on your hardware, operating system, and the load on your machine):

Benchmark: timing 10000 iterations of for, map...

```
for: 4 secs ( 3.97 usr 0.01 sys = 3.98 cpu)
map: 6 secs ( 4.97 usr 0.00 sys = 4.97 cpu)
```

Be aware that a good benchmark is very hard to write. It only tests the data you give it and proves little about the differing complexities of contrasting algorithms.

=head2 How do I cross-reference my Perl programs?

The B::Xref module, shipped with the new, alpha-release Perl compiler (not the general distribution prior to the 5.005 release), can be used to generate cross-reference reports for Perl programs.

```
perl -MO=Xref[,OPTIONS] scriptname.plx
```

=head2 Is there a pretty-printer (formatter) for Perl?

There is no program that will reformat Perl as much as indent(1) does for C. The complex feedback between the scanner and the parser (this feedback is what confuses the vgrind and emacs programs) makes it challenging at best to write a stand-alone Perl parser.

Of course, if you simply follow the guidelines in L<perlstyle>, you shouldn't need to reformat. The habit of formatting your code as you write it will help prevent bugs. Your editor can and should help you with this. The perl-mode or newer cperl-mode for emacs can provide remarkable amounts of help with most (but not all) code, and even less programmable editors can provide significant assistance. Tom swears by the following settings in vi and its clones:

```
set ai sw=4
```

```
map! ^O {^M}^[O^T
```

Now put that in your F<.exerc> file (replacing the caret characters with control characters) and away you go. In insert mode, ^T is for indenting, ^D is for undenting, and ^O is for blockdenting-- as it were. If you haven't used the last one, you're missing a lot. A more complete example, with comments, can be found at <http://www.perl.com/CPAN-local/authors/id/TOMC/scripts/toms.exerc.gz>

If you are used to using the I<vgrind> program for printing out nice code to a laser printer, you can take a stab at this using <http://www.perl.com/CPAN/doc/misc/tips/working.vgrind.entry>, but the results are not particularly satisfying for sophisticated code.

The a2ps at <http://www.infres.enst.fr/%7Edemaille/a2ps/> does lots of things

related to generating nicely printed output of documents.

=head2 Is there a ctags for Perl?

There's a simple one at

<http://www.perl.com/CPAN/authors/id/TOMC/scripts/ptags.gz> which may do the trick. And if not, it's easy to hack into what you want.

=head2

Is there an IDE or Windows Perl Editor?

Perl programs are just plain text, so any editor will do.

If you're on Unix, you already have an IDE--Unix itself. The UNIX philosophy is the philosophy of several small tools that each do one thing and do it well. It's like a carpenter's toolbox.

If you want a Windows IDE, check the following:

=over 4

=item CodeMagicCD

<http://www.codemagiccd.com/>

=item Komodo

ActiveState's cross-platform, multi-language IDE has Perl support, including a regular expression debugger and remote debugging (<http://www.ActiveState.com/Products/Komodo/index.html>). (Visual Perl, a Visual Studio.NET plug-in is currently (early 2001) in beta (<http://www.ActiveState.com/Products/VisualPerl/index.html>)).

=item The Object System

([http://www.castlelink.co.uk/object\\_system/](http://www.castlelink.co.uk/object_system/)) is a Perl web applications development IDE.

=item PerlBuilder

(<http://www.solutionsoft.com/perl.htm>) is an integrated development environment for Windows that supports Perl development.

=item

Perl code magic

(<http://www.petes-place.com/codemagic.html>).

=item visiPerl+

<http://helpconsulting.net/visiperl/>, from Help Consulting.

=back

For editors: if you're on Unix you probably have vi or a vi clone already, and possibly an emacs too, so you may not need to download anything.

In any emacs the cperl-mode (M-x cperl-mode) gives you perhaps the best available Perl editing mode in any editor.

For Windows editors: you can download an Emacs

=over 4

=item GNU Emacs

<http://www.gnu.org/software/emacs/windows/ntemacs.html>

=item MicroEMACS

<http://members.nbci.com/uemacs/>

=item XEmacs

<http://www.xemacs.org/Download/index.html>

=back

or a vi clone such as

=over 4

=item Elvis

<ftp://ftp.cs.pdx.edu/pub/elvis/> <http://www.fh-wedel.de/elvis/>

=item Vile

<http://vile.cx/>

=item Vim

<http://www.vim.org/>

win32: <http://www.cs.vu.nl/%7Etmgil/vi.html>

=back

For vi lovers in general, Windows or elsewhere:

<http://www.thomer.com/thomer/vi/vi.html>.

nvi (<http://www.bostic.com/vi/>,

available from CPAN in src/misc/) is

yet another vi clone, unfortunately not available for Windows, but in UNIX platforms you might be interested in trying it out, firstly because strictly speaking it is not a vi clone, it is the real vi, or the new incarnation of it, and secondly because you can embed Perl inside it to use Perl as the scripting language. nvi is not alone in this, though: at least also vim and vile offer an embedded Perl.

The following are Win32 multilanguage editor/IDESs that support Perl:

=over 4

=item Codewright

<http://www.starbase.com/>

=item MultiEdit

<http://www.MultiEdit.com/>

=item SlickEdit

<http://www.slickedit.com/>

=back

There is also a toedit Text widget based editor written in Perl that is distributed with the Tk module on CPAN. The ptkdb (<http://world.std.com/~aep/ptkdb/>) is a Perl/tk based debugger that acts as a development environment of sorts. Perl Composer (<http://perlcomposer.sourceforge.net/vperl.html>) is an IDE for Perl/Tk GUI creation.

In

addition to an editor/IDE you might be interested in a more powerful shell environment for Win32. Your options include

=over 4

=item Bash

from the Cygwin package (<http://sources.redhat.com/cygwin/>)

=item Ksh

from the MKS Toolkit (<http://www.mks.com/>), or the Bourne shell of the U/WIN environment (<http://www.research.att.com/sw/tools/uwin/>)

=item Tcsh

<ftp://ftp.astron.com/pub/tcsh/>, see also  
<http://www.primite.wisc.edu/software/csh-tcsh-book/>

=item Zsh

<ftp://ftp.blarg.net/users/amol/zsh/>, see also <http://www.zsh.org/>

=back

MKS and U/WIN are commercial (U/WIN is free for educational and research purposes), Cygwin is covered by the GNU Public License (but that shouldn't matter for Perl use). The Cygwin, MKS, and U/WIN all contain (in addition to the shells) a comprehensive set of standard UNIX toolkit utilities.

If you're transferring text files between Unix and Windows using FTP be sure to transfer them in ASCII mode so the ends of lines are appropriately converted.

On

Mac OS the MacPerl Application comes with a simple 32k text editor that behaves like a rudimentary IDE. In contrast to the MacPerl Application the MPW Perl tool can make use of the MPW Shell itself as an editor (with no 32k limit).

=over 4

=item BBEdit and BBEdit Lite

are text editors for Mac OS that have a Perl sensitivity mode (<http://web.barebones.com/>).

=item Alpha

is an editor, written and extensible in Tcl, that nonetheless has built in support for several popular markup and programming languages including Perl and HTML (<http://alpha.olm.net/>).

=back

Pepper and Pe are programming language sensitive text editors for Mac

OS X and BeOS respectively (<http://www.hekkelman.com/>).

=head2 Where can I get Perl macros for vi?

For a complete version of Tom Christiansen's vi configuration file, see [http://www.perl.com/CPAN/authors/Tom\\_Christiansen/scripts/toms.exrc.gz](http://www.perl.com/CPAN/authors/Tom_Christiansen/scripts/toms.exrc.gz) , the standard benchmark file for vi emulators. The file runs best with nvi, the current version of vi out of Berkeley, which incidentally can be built with an embedded Perl interpreter--see <http://www.perl.com/CPAN/src/misc>.

=head2 Where can I get perl-mode for emacs?

Since Emacs version 19 patchlevel 22 or so, there have been both a perl-mode.el and support for the Perl debugger built in. These should come with the standard Emacs 19 distribution.

In the Perl source directory, you'll find a directory called "emacs", which contains a cperl-mode that color-codes keywords, provides context-sensitive help, and other nifty things.

Note that the perl-mode of emacs will have fits with C<"main'foo"> (single quote), and mess up the indentation and highlighting. You are probably using C<"main::foo"> in new Perl code anyway, so this shouldn't be an issue.

=head2 How can I use curses with Perl?

The Curses module from CPAN provides a dynamically loadable object module interface to a curses library. A small demo can be found at the directory [http://www.perl.com/CPAN/authors/Tom\\_Christiansen/scripts/rep](http://www.perl.com/CPAN/authors/Tom_Christiansen/scripts/rep); this program repeats a command and updates the screen as needed, rendering B<rep ps axu> similar to B<top>.

=head2 How can I use X or Tk with Perl?

Tk is a completely Perl-based, object-oriented interface to the Tk toolkit that doesn't force you to use Tcl just to get at Tk. Sx is an interface to the Athena Widget set. Both are available from CPAN. See the directory [http://www.perl.com/CPAN/modules/by-category/08\\_User\\_Interfaces/](http://www.perl.com/CPAN/modules/by-category/08_User_Interfaces/)

Invaluable for Perl/Tk programming are the Perl/Tk FAQ at <http://w4.lns.cornell.edu/%7Epvhp/ptk/ptkTOC.html> , the Perl/Tk Reference Guide available at [http://www.perl.com/CPAN-local/authors/Stephen\\_O\\_Lidie/](http://www.perl.com/CPAN-local/authors/Stephen_O_Lidie/) , and the online manpages at <http://www-users.cs.umn.edu/%7Eamundson/perl/perlTk/toc.html> .

=head2 How can I generate simple menus without using CGI or Tk?

The <http://www.perl.com/CPAN/authors/id/SKUNZ/perlmenu.v4.0.tar.gz> module, which is curses-based, can help with this.

=head2 What is undump?

See the next question on "How can I make my Perl program run faster?"

=head2 How can I make my Perl program run faster?

The best way to do this is to come up with a better algorithm. This can often make a dramatic difference. Jon Bentley's book "Programming Pearls" (that's not a misspelling!) has some good tips on optimization, too. Advice on benchmarking boils down to: benchmark and profile to make sure you're optimizing the right part, look for better algorithms instead of microtuning your code, and when all else fails consider just buying faster hardware.

A different approach is to autoload seldom-used Perl code. See the `AutoSplit` and `AutoLoader` modules in the standard distribution for that. Or you could locate the bottleneck and think about writing just that part in C, the way we used to take bottlenecks in C code and write them in assembler. Similar to rewriting in C, modules that have critical sections can be written in C (for instance, the `PDL` module from CPAN).

In some cases, it may be worth it to use the backend compiler to produce byte code (saving compilation time) or compile into C, which will certainly save compilation time and sometimes a small amount (but not much) execution time. See the question about compiling your Perl programs for more on the compiler--the wins aren't as obvious as you'd hope.

If you're currently linking your perl executable to a shared `libc.so`, you can often gain a 10-25% performance benefit by rebuilding it to link with a static `libc.a` instead. This will make a bigger perl executable, but your Perl programs (and programmers) may thank you for it. See the `INSTALL` file in the source distribution for more information.

Unsubstantiated reports allege that Perl interpreters that use `sfio` outperform those that don't (for I/O intensive applications). To try this, see the `INSTALL` file in the source distribution, especially the "Selecting File I/O mechanisms" section.

The undump program was an old attempt to speed up your Perl program by storing the already-compiled form to disk. This is no longer a viable option, as it only worked on a few architectures, and wasn't a good solution anyway.

=head2 How can I make my Perl program take less memory?

When it comes to time-space tradeoffs, Perl nearly always prefers to throw memory at a problem. Scalars in Perl use more memory than strings in C, arrays take more than that, and hashes use even more. While there's still a lot to be done, recent releases have been addressing these issues. For example, as of 5.004, duplicate hash keys are shared amongst all hashes using them, so require no reallocation.

In some cases, using substr() or vec() to simulate arrays can be highly beneficial. For example, an array of a thousand booleans will take at least 20,000 bytes of space, but it can be turned into one 125-byte bit vector--a considerable memory savings. The standard Tie::SubstrHash module can also help for certain types of data structure. If you're working with specialist data structures (matrices, for instance) modules that implement these in C may use less memory than equivalent Perl modules.

Another thing to try is learning whether your Perl was compiled with the system malloc or with Perl's builtin malloc. Whichever one it is, try using the other one and see whether this makes a difference. Information about malloc is in the F<INSTALL> file in the source distribution. You can find out whether you are using perl's malloc by typing C<perl -V:usemymalloc>.

=head2 Is it unsafe to return a pointer to local data?

No, Perl's garbage collection system takes care of this.

```
sub makeone {
    my @a = ( 1 .. 10 );
    return \@a;
}

for $i ( 1 .. 10 ) {
    push @many, makeone();
}

print $many[4][5], "\n";
```

```
print "@many\n";
```

=head2 How can I free an array or hash so my program shrinks?

You can't. On most operating systems, memory allocated to a program can never be returned to the system. That's why long-running programs sometimes re-exec

themselves. Some operating systems (notably, FreeBSD and Linux) allegedly reclaim large chunks of memory that is no longer used, but it doesn't appear to happen with Perl (yet). The Mac appears to be the only platform that will reliably (albeit, slowly) return memory to the OS.

We've had reports that on Linux (Redhat 5.1) on Intel, C<undef \$scalar> will return memory to the system, while on Solaris 2.6 it won't. In general, try it yourself and see.

However, judicious use of my() on your variables will help make sure that they go out of scope so that Perl can free up that space for use in other parts of your program. A global variable, of course, never goes out of scope, so you can't get its space automatically reclaimed, although undef()ing and/or delete()ing it will achieve the same effect. In general, memory allocation and de-allocation isn't something you can or should be worrying about much in Perl, but even this capability (preallocation of data types) is in the works.

=head2

How can I make my CGI script more efficient?

Beyond the normal measures described to make general Perl programs faster or smaller, a CGI program has additional issues. It may be run several times per second. Given that each time it runs it will need to be re-compiled and will often allocate a megabyte or more of system memory, this can be a killer. Compiling into C B<isn't going to help you> because the process start-up overhead is where the bottleneck is.

There are two popular ways to avoid this overhead. One solution involves running the Apache HTTP server (available from <http://www.apache.org/>) with either of the mod\_perl or mod\_fastcgi plugin modules.

With mod\_perl and the Apache::Registry module (distributed with mod\_perl), httpd will run with an embedded Perl interpreter which pre-compiles your script and then executes it within the same address space without forking. The Apache extension also gives Perl access to the internal server API, so modules written in Perl can

do just about

anything a module written in C can. For more on mod\_perl, see

<http://perl.apache.org/>

With the FCGI module (from CPAN) and the mod\_fastcgi module (available from <http://www.fastcgi.com/>) each of your Perl programs becomes a permanent CGI daemon process.

Both of these solutions can have far-reaching effects on your system and on the way you write your CGI programs, so investigate them with care.

See [http://www.perl.com/CPAN/modules/by-category/15\\_World\\_Wide\\_Web\\_HTML\\_HTTP\\_CGI/](http://www.perl.com/CPAN/modules/by-category/15_World_Wide_Web_HTML_HTTP_CGI/).

A non-free, commercial product, ``The Velocity Engine for Perl'', (<http://www.binevolve.com/> or <http://www.binevolve.com/velocigen/>) might also be worth looking at. It will allow you to increase the performance of your Perl programs, running programs up to 25 times faster than normal CGI Perl when running in persistent Perl mode or 4 to 5 times faster without any modification to your existing CGI programs. Fully functional evaluation copies are available from the web site.

=head2 How can I  
hide the source for my Perl program?

Delete it. :-) Seriously, there are a number of (mostly unsatisfactory) solutions with varying levels of ``security''.

First of all, however, you I<can't> take away read permission, because the source code has to be readable in order to be compiled and interpreted. (That doesn't mean that a CGI script's source is readable by people on the web, though--only by people with access to the filesystem.) So you have to leave the permissions at the socially friendly 0755 level.

Some people regard this as a security problem. If your program does insecure things and relies on people not knowing how to exploit those insecurities, it is not secure. It is often possible for someone to determine the insecure things and exploit them without viewing the source. Security through obscurity, the name for hiding your bugs instead of fixing them, is little security indeed.

You can try using encryption via source filters (Filter::\* from CPAN), but any decent programmer will be able to decrypt it. You can try using the byte code compiler and interpreter described below, but the curious might still be able to de-compile it. You can try using the native-code compiler described below, but crackers might be able to disassemble it. These pose varying degrees of difficulty to people wanting to get at

your code, but none can definitively conceal it (true of every language, not just Perl).

If you're concerned about people profiting from your code, then the bottom line is that nothing but a restrictive license will give you legal security. License your software and pepper it with threatening statements like ``This is unpublished proprietary software of XYZ Corp. Your access to it does not give you permission to use it blah blah blah." We are not lawyers, of course, so you should see a lawyer if you want to be sure your license's wording will stand up in court.

=head2 How can I compile my Perl program into byte code or C?

Malcolm Beattie has written a multifunction backend compiler, available from CPAN, that can do both these things. It is included in the perl5.005 release, but is still considered experimental. This means it's fun to play with if you're a programmer but not really for people looking for turn-key solutions.

Merely compiling into C does not in and of itself guarantee that your code will run very much faster. That's because except for lucky cases where a lot of native type inferencing is possible, the normal Perl run-time system is still present and so your program will take just as long to run and be just as big. Most programs save little more than compilation time, leaving execution no more than 10-30% faster. A few rare programs actually benefit significantly (even running several times faster), but this takes some tweaking of your code.

You'll probably be astonished to learn that the current version of the compiler generates a compiled form of your script whose executable is just as big as the original perl executable, and then some. That's because as currently written, all programs are prepared for a full eval() statement. You can tremendously reduce this cost by building a shared I<libperl.so> library and linking against that. See the F<INSTALL> podfile in the Perl source distribution for details. If you link your main perl binary with this, it will make it minuscule. For example, on one author's system, F</usr/bin/perl> is only 11k in size!

In general, the compiler will do nothing to make a Perl program smaller, faster, more portable, or more secure. In fact, it can make your situation worse. The executable will be bigger, your VM system may take longer to load the whole thing, the binary is fragile and hard to fix, and compilation never stopped software piracy in the form of crackers, viruses, or bootleggers. The real advantage of the compiler is merely packaging, and once you see the size of what it makes (well, unless

you use a shared I<libperl.so>), you'll probably want a complete Perl install anyway.

=head2 How can I compile Perl into Java?

You can also integrate Java and Perl with the Perl Resource Kit from O'Reilly and Associates. See <http://www.oreilly.com/catalog/prkunix/>.

Perl 5.6 comes with Java Perl Lingo, or JPL. JPL, still in development, allows Perl code to be called from Java. See [jpl/README](#) in the Perl source tree.

=head2 How can I get C<#!perl> to work on [MS-DOS,NT,...]?

For OS/2 just use

```
extproc perl -S -your_switches
```

as the first line in C<\*.cmd> file (C<-S> due to a bug in cmd.exe's 'extproc' handling). For DOS one should first invent a corresponding batch file and codify it in C<ALTERNATIVE\_SHEBANG> (see the F<INSTALL> file in the source distribution for more information).

The Win95/NT installation, when using the ActiveState port of Perl, will modify the Registry to associate the C<.pl> extension with the perl interpreter. If you install another port, perhaps even building your own Win95/NT Perl from the standard sources by using a Windows port of gcc (e.g., with cygwin or mingw32), then you'll have to modify the Registry yourself. In addition to associating C<.pl> with the interpreter, NT people can use: C<SET PATHEXT=%PATHEXT%;.PL> to let them run the program C<install-linux.pl> merely by typing C<install-linux>.

Macintosh Perl programs will have the appropriate Creator and Type, so that double-clicking them will invoke the Perl application.

I<IMPORTANT!>: Whatever you do, PLEASE don't get frustrated, and just throw the perl interpreter into your cgi-bin directory, in order to get your programs working for a web server. This is an EXTREMELY big security risk. Take the time to figure out how to do it correctly.

=head2 Can I write useful Perl programs on the command line?

Yes. Read L<perlrn> for more information. Some examples follow. (These assume standard Unix shell quoting rules.)

```

# sum first and last fields
perl -lane 'print $F[0] + $F[-1]' *

# identify text files
perl -le 'for(@ARGV) {print if -f && -T _}' *

# remove (most) comments from C program
perl -0777 -pe 's/{\^*.*?\^/*}/{}gs' foo.c

# make file a month younger than today, defeating reaper daemons
perl -e '$X=24*60*60; utime(time(),time() + 30 * $X,@ARGV)' *

# find first unused uid
perl -le '$i++ while getpwuid($i); print $i'

# display reasonable manpath
echo $PATH | perl -nl -072 -e '
s![^/+]*$!man!&&-d&&!$s{$_}++&&push@m,$_;END{print"@m"}'

```

OK, the last one was actually an Obfuscated Perl Contest entry. :-)

=head2 Why don't Perl one-liners work on my DOS/Mac/VMS system?

The problem is usually that the command interpreters on those systems have rather different ideas about quoting than the Unix shells under which the one-liners were created. On some systems, you may have to change single-quotes to double ones, which you must I<NOT> do on Unix or Plan9 systems. You might also have to change a single % to a %%.

For example:

```

# Unix
perl
-e 'print "Hello world\n"'

# DOS, etc.
perl -e "print \"Hello world\n\""

# Mac
print "Hello world\n"
(then Run "Myscript" or Shift-Command-R)

# VMS
perl -e "print ""Hello world\n""

```

The problem is that none of these examples are reliable: they depend on the command interpreter. Under Unix, the first two often work. Under DOS, it's entirely possible that neither works. If 4DOS was the command shell,

you'd probably have better luck like this:

```
perl -e "print <Ctrl-x>"Hello world\n<Ctrl-x>"
```

Under the Mac, it depends which environment you are using. The MacPerl shell, or MPW, is much like Unix shells in its support for several quoting variants, except that it makes free use of the Mac's non-ASCII characters as control characters.

Using qq(), q(), and qx(), instead of "double quotes", 'single quotes', and `backticks`, may make one-liners easier to write.

There is no general solution to all of this. It is a mess, pure and simple. Sucks to be away from Unix, huh? :-)

[Some of this answer was contributed by Kenneth Albanowski.]

=head2 Where can I learn about CGI or Web programming in Perl?

For modules, get the CGI or LWP modules from CPAN. For textbooks, see the two especially dedicated to web stuff in the question on books. For problems and questions related to the web, like ``Why do I get 500 Errors" or ``Why doesn't it run from the browser right when it runs fine on the command line", see these sources:

CGI Security FAQ

<http://www.go2net.com/people/paulp/cgi-security/safe-cgi.txt>

=head2 Where can I learn about object-oriented Perl programming?

A good place to start is [L<perltoot>](#), and you can use [L<perlobj>](#), [L<perlboot>](#), and [L<perlbot>](#) for reference. Perltoot didn't come out until the 5.004 release; you can get a copy (in pod, html, or postscript) from <http://www.perl.com/CPAN/doc/FMTEYEWTK/>.

=head2 Where can I learn about linking C with Perl? [h2xs, xsubpp]

If you want to call C from Perl, start with [L<perlxstut>](#), moving on to [L<perlxs>](#), [L<xsubpp>](#), and [L<perlguts>](#). If you want to call Perl from C, then read [L<perlembed>](#), [L<perlcall>](#), and [L<perlguts>](#). Don't forget that you can learn a lot from looking at how the authors of existing extension modules wrote their code and solved their problems.

=head2 I've read perlembed, perlguts, etc., but I can't embed perl in my C program; what am I doing wrong?

Download the ExtUtils::Embed kit from CPAN and run `make test'. If the tests pass, read the pods again and again and again. If they fail, see [L<perlbug>](#) and send a bug report with the output of `C<make test TEST_VERBOSE=1>` along with `C<perl -V>`.

=head2 When I tried to run my script, I got this message. What does it mean?

A complete list of Perl's error messages and warnings with explanatory text can be found in [L<perldiag>](#). You can also use the `splain` program (distributed with Perl) to explain the error messages:

```
perl program 2>diag.out
splain [-v] [-p] diag.out
```

or change your program to explain the messages for you:

```
use diagnostics;
```

or

```
use diagnostics -verbose;
```

=head2 What's MakeMaker?

This module (part of the standard Perl distribution) is designed to write a Makefile for an extension module from a Makefile.PL. For more

information, see L<ExtUtils::MakeMaker>.

## =head1 NAME

Pod::Simple::Subclassing -- write a formatter as a Pod::Simple subclass

## =head1 SYNOPSIS

```
package Pod::SomeFormatter;  
use Pod::Simple;  
@ISA = qw(Pod::Simple);  
$VERSION = '1.01';  
use strict;  
  
sub _handle_element_start {  
    my($parser, $element_name, $attr_hash_r) = @_;  
    ...  
}  
  
sub _handle_element_end {  
    my($parser, $element_name, $attr_hash_r) = @_;  
    # NOTE: $attr_hash_r is only present when $element_name is "over" or "begin"  
    # The remaining code excerpts will mostly ignore this $attr_hash_r, as it is  
    # mostly useless. It is documented where "over-*" and "begin" events are  
    # documented.  
    ...  
}
```

```

}

sub _handle_text {
my($parser, $text) = @_ ;
...
}
1;

```

=head1 DESCRIPTION

This document is about using Pod::Simple to write a Pod processor, generally a Pod formatter. If you just want to know about using an existing Pod formatter, instead see its documentation and see also the docs in L<Pod::Simple>.

The

zeroeth step in writing a Pod formatter is to make sure that there isn't already a decent one in CPAN. See L<<http://search.cpan.org/>>, and run a search on the name of the format you want to render to. Also consider joining the Pod People list L<<http://lists.perl.org/showlist.cgi?name=pod-people>> and asking whether anyone has a formatter for that format -- maybe someone cobbled one together but just hasn't released it.

The first step in writing a Pod processor is to read L<[perlpodspec](#)>, which contains notes information on writing a Pod parser (which has been largely taken care of by Pod::Simple), but also a lot of requirements and recommendations for writing a formatter.

The second step is to actually learn the format you're planning to format to -- or at least as much as you need to know to represent Pod, which probably isn't much.

The third step is to pick which of Pod::Simple's interfaces you want to use -- the basic interface via Pod::Simple or L<Pod::Simple::Methody> is event-based, sort of like L<HTML::Parser>'s interface, or sort of like L<XML::Parser>'s "Handlers" interface), but L<Pod::Simple::PullParser> provides a token-stream interface, sort of like L<HTML::TokenParser>'s interface; L<Pod::Simple::SimpleTree> provides a simple tree interface, rather like XML::Parser's "Tree" interface. Users familiar with XML-handling will find one of these styles relatively familiar; but if you would be even more at home with XML, there are classes that produce an XML representation of the Pod stream, notably L<Pod::Simple::XMLOutputStream>; you can feed the output of such a class to whatever XML parsing system you are most at home with.

The last step is to write your code based on how the events (or tokens,

or tree-nodes, or the XML, or however you're parsing) will map to constructs in the output format. Also sure to consider how to escape text nodes containing arbitrary text, and also what to do with text nodes that represent preformatted text (from verbatim sections).

=head1 Events

TODO intro... mention that events are supplied for implicits, like for missing >'s

In the following section, we use XML to represent the event structure associated with a particular construct. That is, TODO

=over

=item C<< \$parser->\_handle\_element\_start( I<element\_name>, I<attr\_hashref> ) >>

=item C<< \$parser->\_handle\_element\_end( I<element\_name> ) >>

=item C<< \$parser->\_handle\_text( I<text\_string> ) >>

=back

TODO describe

=over

=item events with an element\_name of Document

Parsing a document produces this event structure:

```
<Document start_line="543">  
...all events...  
</Document>
```

The value of the I<start\_line> attribute will be the line number of the first Pod directive in the document.

If there is no Pod in the given document, then the event structure will be this:

```
<Document contentless="1" start_line="543">  
</Document>
```

In that case, the value of the `I<start_line>` attribute will not be meaningful; under current implementations, it will probably be the line number of the last line in the file.

=item events with an `element_name` of `Para`

Parsing a plain (non-verbatim, non-directive, non-data) paragraph in a Pod document produces this event structure:

```
<Para start_line="543">
  ...all events in this paragraph...
</Para>
```

The value of the `I<start_line>` attribute will be the line number of the start of the paragraph.

For example, parsing this paragraph of Pod:

The value of the `I<start_line>` attribute will be the line number of the start of the paragraph.

produces this event structure:

```
<Para start_line="129">
  The value of the
  <I>
  start_line
  </I>
  attribute will be the line number of the first Pod directive
  in the document.
</Para>
```

=item events with an `element_name` of `B`, `C`, `F`, or `I`.

Parsing a `BE<lt>...E<gt>` formatting code (or of course any of its semantically identical syntactic variants

`S<BE<lt>E<lt> ... E<gt>E<gt>>`,  
or `S<BE<lt>E<lt>E<lt>E<lt> ... E<gt>E<gt>E<gt>E<gt>>`, etc.)

produces  
this event structure:

```
<B>
...stuff...
</B>
```

Currently, there are no attributes conveyed.

Parsing C, F, or I codes produce the same structure, with only a different element name.

If your parser object has been set to accept other formatting codes, then they will be presented like these B/C/F/I codes -- i.e., without any attributes.

=item events with an element\_name of S

Normally, parsing an SE<lt>...E<gt> sequence produces this event structure, just as if it were a B/C/F/I code:

```
<S>
...stuff...
</S>
```

However, Pod::Simple (and presumably all derived parsers) offers the C<nbsp\_for\_S> option which, if enabled, will suppress all S events, and instead change all spaces in the content to non-breaking spaces. This is intended for formatters that output to a format that has no code that means the same as SE<lt>...E<gt>, but which has a code/character that means non-breaking space.

=item events with an element\_name of X

Normally, parsing an XE<lt>...E<gt> sequence produces this event structure, just as if it were a B/C/F/I code:

```
<X>
...stuff...
</X>
```

However, Pod::Simple (and presumably all derived parsers) offers the C<nix\_X\_codes> option which, if enabled, will suppress all X events and ignore their content. For formatters/processors that don't use X events, this is presumably quite useful.

=item events with an element\_name of L

Because the LE<lt>...E<gt> is the most complex construct in the language, it should not surprise you that the events it generates are the most complex in the language. Most of complexity is hidden away in the attribute values, so for those of you writing a Pod formatter that produces a non-hypertextual format, you can just ignore the attributes and treat an L event structure like a formatting element that

(presumably) doesn't actually produce a change in formatting. That is, the content of the L event structure (as opposed to its attributes) is always what text should be displayed.

There are, at first glance, three kinds of L links: URL, man, and pod.

When a LE<lt>I<some\_url>E<gt> code is parsed, it produces this event structure:

```
<L content-implicit="yes" raw="that_url" to="that_url" type="url">
that_url
</L>
```

The C<type="url"> attribute is always specified for this type of L code.

For example, this Pod source:

```
L<http://www.perl.com/CPAN/authors/>
```

produces this event structure:

```
<L content-implicit="yes" raw="http://www.perl.com/CPAN/authors/" to="http://www.perl.com/CPAN/authors/"
type="url">
http://www.perl.com/CPAN/authors/
</L>
```

When a LE<lt>I<manpage(section)>E<gt> code is parsed (and these are fairly rare and not terribly useful), it produces this event structure:

```
<L content-implicit="yes" raw="manpage(section)" to="manpage(section)" type="man">
manpage(section)
</L>
```

The C<type="man"> attribute is always specified for this type of L code.

For example, this Pod source:

```
L<crontab(5)>
```

produces this event structure:

```
<L content-implicit="yes" raw="crontab(5)"
to="crontab(5)" type="man">
crontab(5)
</L>
```

In the rare cases where a man page link has a specified, that text appears in a `I<section>` attribute. For example, this Pod source:

```
L<crontab(5)/"ENVIRONMENT">
```

will produce this event structure:

```
<L content-implicit="yes" raw="crontab(5)/&quot;ENVIRONMENT&quot;" section="ENVIRONMENT"
to="crontab(5)" type="man">
"ENVIRONMENT" in crontab(5)
</L>
```

In the rare case where the Pod document has code like `LE<lt>I<sometext>|I<manpage(section)>E<gt>`, then the `I<sometext>` will appear as the content of the element, the `I<manpage(section)>` text will appear only as the value of the `I<to>` attribute, and there will be no `C<content-implicit="yes">` attribute (whose presence means that the Pod parser had to infer what text should appear as the link text -- as opposed to cases where that attribute is absent, which means that the Pod parser did `I<not>` have to infer the link text, because that `L` code explicitly specified some link text.)

For example, this Pod source:

```
L<hell itself!|crontab(5)>
```

will produce this event structure:

```
<L raw="hell itself!|crontab(5)" to="crontab(5)" type="man">
hell itself!
</L>
```

The last type of `L` structure is for links to/within Pod documents. It is the most complex because it can have a `I<to>` attribute, `I<or>` a `I<section>` attribute, or both. The `C<type="pod">` attribute is always specified for this type of `L` code.

In the most common case, the simple case of a `LE<lt>podpageE<gt>` code produces this event structure:

```
<L content-implicit="yes" raw="podpage" to="podpage" type="pod">
podpage
</L>
```

For example, this Pod source:

L<Net::Ping>

produces this event structure:

```
<L content-implicit="yes" raw="Net::Ping" to="Net::Ping" type="pod">
Net::Ping
</L>
```

In cases where there is link-text explicitly specified, it is to be found in the content of the element (and not the attributes), just as with the LE<lt>I<somertext>|I<manpage(section)>E<gt> case discussed above. For example, this Pod source:

L<Perl Error Messages|perldiag>

produces this event structure:

```
<L raw="Perl Error Messages|perldiag" to="perldiag" type="pod">
Perl Error Messages
</L>
```

In cases of links to a section in the current Pod document, there is a I<section> attribute instead of a I<to> attribute. For example, this Pod source:

L</"Member Data">

produces this event structure:

```
<L content-implicit="yes" raw="/"&quot;Member Data&quot;" section="Member Data" type="pod">
"Member Data"
</L>
```

As another example, this Pod source:

L<the various attributes/"Member Data">

produces this event structure:

```
<L raw="the various attributes/"&quot;Member Data&quot;" section="Member Data" type="pod">
the various attributes
</L>
```

In cases of links to a section in a different Pod document, there are both a I<section> attribute and a L<to> attribute. For example, this Pod source:

```
L<perlsyn/"Basic BLOCKs and Switch Statements">
```

produces this event structure:

```
<L content-implicit="yes"
raw="perlsyn/&quot;Basic BLOCKs and Switch Statements&quot;" section="Basic BLOCKs and Switch
Statements" to="perlsyn" type="pod">
"Basic BLOCKs and Switch Statements" in perlsyn
</L>
```

As another example, this Pod source:

```
L<SWITCH statements|perlsyn/"Basic BLOCKs and Switch Statements">
```

produces this event structure:

```
<L raw="SWITCH statements|perlsyn/&quot;Basic BLOCKs and Switch Statements&quot;" section="Basic
BLOCKs and Switch Statements" to="perlsyn" type="pod">
SWITCH statements
</L>
```

Incidentally, note that we do not distinguish between these syntaxes:

```
L</"Member Data">
L<"Member Data">
L</Member Data>
L<Member Data> [deprecated syntax]
```

That is, they all produce the same event structure (for the most part), namely:

```
<L content-implicit="yes" raw="$depends_on_syntax" section="Member Data" type="pod">
&#34;Member Data&#34;
</L>
```

The `I<raw>` attribute depends on what the raw content of the `C<LE<lt>E<gt>>` is, so that is why the event structure is the same "for the most part".

If you have not guessed it yet, the `I<raw>` attribute contains the raw, original, unescaped content of the `C<LE<lt>E<gt>>` formatting code. In addition to the examples above, take notice of the following event structure produced by the following `C<LE<lt>E<gt>>` formatting code.

```
L<click B<here>|page/About the C<-M> switch>
```

```
<L raw="click B<here>|page/About the C<-M> switch" section="About the -M switch" to="page" type="pod">
click B<here>
</L>
```

Specifically, notice that the formatting codes are present and unescaped in I<raw>.

There is a known bug in the I<raw> attribute where any surrounding whitespace is condensed into a single ' '. For example, given LE<60> linkE<62>, I<raw> will be " link".

=item events with an element\_name of E or Z

While there are Pod codes EE<lt>...E<gt> and ZE<lt>E<gt>, these I<do not> produce any E or Z events -- that is, there are no such events as E or Z.

=item events with an element\_name of Verbatim

When a Pod verbatim paragraph (AKA "codeblock") is parsed, it produces this event structure:

```
<Verbatim start_line="543" xml:space="preserve">
...text...
</Verbatim>
```

The value of the I<start\_line> attribute will be the line number of the first line of this verbatim block. The I<xml:space> attribute is always present, and always has the value "preserve".

The text content will have tabs already expanded.

=item events with an element\_name of head1 .. head4

When a "=head1 ..." directive is parsed, it produces this event structure:

```
<head1>
...stuff...
</head1>
```

For example, a directive consisting of this:

=head1 Options to C<new> et al.

will produce this event structure:

```
<head1 start_line="543">
Options to
```

```
<C>
  new
</C>
et al.
</head1>
```

"=head2" thru "=head4" directives are the same, except for the element names in the event structure.

=item events with an element\_name of encoding

In the default case, the events corresponding to C<=encoding> directives are not emitted.

They are emitted if C<keep\_encoding\_directive> is true.

In that case they produce event structures like

L</"events with an element\_name of head1 .. head4"> above.

=item events with an element\_name of over-bullet

When an "=over ... Z<>=back" block is parsed where the items are a bulleted list, it will produce this event structure:

```
<over-bullet indent="4" start_line="543">
<item-bullet start_line="545">
  ...Stuff...
</item-bullet>
...more item-bullets...
</over-bullet fake-closer="1">
```

The attribute I<fake-closer> is only present if it is a true value; it is not present if it is a false value. It is shown in the above example to illustrate where the attribute is (in the B<closing> tag). It signifies that the C<=over> did not have a matching C<=back>, and thus Pod::Simple had to create a fake closer.

For example, this Pod source:

```
=over

=item *

Something

=back
```

Would produce an event structure that does B<not> have the I<fake-closer> attribute, whereas this Pod source:

=over

=item \*

Gasp! An unclosed =over block!

would. The rest of the over-\* examples will not demonstrate this attribute, but they all can have it. See L<Pod::Checker>'s source for an example of this attribute being used.

The value of the I<indent> attribute is whatever value is after the "=over" directive, as in "=over 8". If no such value is specified in the directive, then the I<indent> attribute has the value "4".

For example, this Pod source:

=over

=item \*

Stuff

=item \*

Bar I<baz>!

=back

produces this event structure:

```
<over-bullet indent="4" start_line="10">  
<item-bullet start_line="12">  
  Stuff  
</item-bullet>  
<item-bullet start_line="14">  
  Bar <I>baz</I>!  
</item-bullet>  
</over-bullet>
```

=item events with an element\_name of over-number

When an "=over ... Z<>=back" block is parsed where the items are a numbered list, it will produce this event structure:

```
<over-number indent="4" start_line="543">  
<item-number number="1" start_line="545">
```

```
...Stuff...
</item-number>
...more item-number...
</over-bullet>
```

This is like the "over-bullet" event structure; but note that the contents are "item-number" instead of "item-bullet", and note that they will have a "number" attribute, which some formatters/processors may ignore (since, for example, there's no need for it in HTML when producing an "<UL><LI>...</LI>...</UL>" structure), but which any processor may use.

Note that the values for the I<number> attributes of "item-number" elements in a given "over-number" area I<will> start at 1 and go up by one each time. If the Pod source doesn't follow that order (even though it really should!), whatever numbers it has will be ignored (with the correct values being put in the I<number> attributes), and an error message might be issued to the user.

=item events with an element\_name of over-text

These events are somewhat unlike the other over-\* structures, as far as what their contents are. When an "=over ... Z<>=back" block is parsed where the items are a list of text "subheadings", it will produce this event structure:

```
<over-text indent="4" start_line="543">
<item-text>
...stuff...
</item-text>
...stuff (generally Para or Verbatim elements)...
<item-text>
...more item-text and/or stuff...
</over-text>
```

The I<indent> and I<fake-closer> attributes are as with the other over-\* events.

For example, this Pod source:

```
=over

=item Foo

Stuff

=item Bar I<baz>!

Quux
```

=back

produces this event structure:

```
<over-text indent="4" start_line="20">
<item-text start_line="22">
  Foo
</item-text>
<Para start_line="24">
  Stuff
</Para>
<item-text start_line="26">
  Bar
  <I>
    baz
  </I>
  !
</item-text>
<Para start_line="28">
  Quux
</Para>
</over-text>
```

=item events with an element\_name of over-block

These events are somewhat unlike the other over-\* structures, as far as what their contents are. When an "=over ... Z<>=back" block is parsed where there are no items, it will produce this event structure:

```
<over-block indent="4" start_line="543">
...stuff (generally Para or Verbatim elements)...
</over-block>
```

The I<indent> and I<fake-closer> attributes are as with the other over-\* events.

For example, this Pod source:

=over

For cutting off our trade with all parts of the world

For transporting us beyond seas to be tried for pretended offenses

He is at this time transporting large armies of foreign mercenaries to complete the works of death, desolation and tyranny, already begun with circumstances of cruelty and perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the head of a civilized nation.

=back

will produce this event structure:

```
<over-block indent="4" start_line="2">
<Para start_line="4">
  For cutting off our trade with all parts of the world
</Para>
<Para start_line="6">
  For transporting us beyond seas to be tried for pretended offenses
</Para>
<Para start_line="8">
```

```
  He is at this time transporting large armies of [...more text...]
</Para>
</over-block>
```

=item events with an element\_name of over-empty

B<Note: These events are only triggered if C<parse\_empty\_lists()> is set to a true value.>

These events are somewhat unlike the other over-\* structures, as far as what their contents are. When an "=over ... Z<>=back" block is parsed where there is no content, it will produce this event structure:

```
<over-empty indent="4" start_line="543">
</over-empty>
```

The I<indent> and I<fake-closer> attributes are as with the other over-\* events.

For example, this Pod source:

```
=over

=over

=back

=back
```

will produce this event structure:

```
<over-block indent="4" start_line="1">
<over-empty indent="4" start_line="3">
</over-empty>
</over-block>
```

Note that the outer C<=over> is a block because it has no C<=item>s but still has content: the inner C<=over>. The inner C<=over>, in turn, is completely empty, and is treated as such.

```
=item events
with an element_name of item-bullet
```

See L</"events with an element\_name of over-bullet">, above.

```

=back
```

```
=head1 More Pod::Simple Methods
```

Pod::Simple provides a lot of methods that aren't generally interesting to the end user of an existing Pod formatter, but some of which you might find useful in writing a Pod formatter. They are listed below. The first several methods (the accept\_\* methods) are for declaring the capabilities of your parser, notably what C<=for I<targetname>> sections it's interested in, what extra NE<lt>...E<gt> codes it accepts beyond the ones described in the I<perlpod>.

```
=over
```

```
=item C<< $parser->accept_targets( I<SOMEVALUE> ) >>
```

As the parser  
sees sections like:

```
=for html 
```

or

```
=begin html
```

```

```

```
=end html
```

...the parser will ignore these sections unless your subclass has specified that it wants to see sections targeted to "html" (or whatever the formatter name is).

If you want to process all sections, even if they're not targeted for you, call this before you start parsing:

```
$parser->accept_targets('*');
```

```
=item C<< $parser->accept_targets_as_text( I<SOMEVALUE> ) >>
```

This is like `accept_targets`, except that it specifies also that the content of sections for this target should be treated as Pod text even if the target name in "`=for I<targetname>`" doesn't start with a ":".

At time of writing, I don't think you'll need to use this.

```
=item C<< $parser->accept_codes( I<Codename>, I<Codename>... ) >>
```

This tells the parser that you accept additional formatting codes, beyond just the standard ones (I B C L F S X, plus the two weird ones you don't actually see in the parse tree, Z and E). For example, to also accept codes "N", "R", and "W":

```
$parser->accept_codes( qw( N R W ) );
```

B<TODO: document how this interacts with `=extend`, and long element names>

```
=item C<< $parser->accept_directive_as_data( I<directive_name> ) >>
```

```
=item C<< $parser->accept_directive_as_verbatim( I<directive_name> ) >>
```

```
=item C<< $parser->accept_directive_as_processed( I<directive_name> ) >>
```

In the unlikely situation that you need to tell the parser that you will accept additional directives ("=foo" things), you need to first set the parser to treat its content as data (i.e., not really processed at all), or as verbatim (mostly just expanding tabs), or as processed text (parsing formatting codes like BE<lt>...E<gt>).

For example, to accept a new directive "=method", you'd presumably use:

```
$parser->accept_directive_as_processed("method");
```

so that you could have Pod lines like:

```
=method I<$whatever> thing B<um>
```

Making up your own directives breaks compatibility with other Pod formatters,

in a way that using "=for I<target> ..." lines doesn't;

however, you may find this useful if you're making a Pod superset format where you don't need to worry about compatibility.

```
=item C<< $parser->nbsp_for_S( I<BOOLEAN> ); >>
```

Setting this attribute to a true value (and by default it is false) will turn "SE<lt>...E<gt>" sequences into sequences of words separated by C<\xA0> (non-breaking space) characters. For example, it will take this:

```
I like S<Dutch apple pie>, don't you?
```

and treat it as if it were:

```
I like DutchE<nbsp>appleE<nbsp>pie, don't you?
```

This is handy for output formats that don't have anything quite like an "SE<lt>...E<gt>" code, but which do have a code for non-breaking space.

There is currently no method for going the other way; but I can probably provide one upon request.

```
=item C<< $parser->version_report() >>
```

This returns a string reporting the \$VERSION value from your module (and its classname) as well as the \$VERSION value of Pod::Simple. Note

that

L<perlpodspec> requires output formats (wherever possible) to note this detail in a comment in the output format. For example, for some kind of SGML output format:

```
print OUT "<!-- \n", $parser->version_report, "\n -->";
```

```
=item C<< $parser->pod_para_count() >>
```

This returns the count of Pod paragraphs seen so far.

```
=item C<< $parser->line_count() >>
```

This is the current line number being parsed. But you might find the "line\_number" event attribute more accurate, when it is present.

```
=item C<< $parser->nix_X_codes( I<SOMEVALUE> ) >>
```

This attribute, when set to a true value (and it is false by default) ignores any "XE<lt>...E<gt>" sequences in the document being parsed. Many formats don't actually use the content of these codes, so have no reason to process them.

```
=item C<< $parser->keep_encoding_directive( I<SOMEVALUE> ) >>
```

This attribute, when set to a true value (it is false by default) will keep C<=encoding> and its content in the event structure. Most formats don't actually need to process the content of an C<=encoding> directive, even when this directive sets the encoding and the processor makes use of the encoding information. Indeed, it is possible to know the encoding without processing the directive content.

```
=item C<< $parser->merge_text( I<SOMEVALUE> ) >>
```

This attribute, when set to a true value (and it is false by default) makes sure that only one event (or token, or node) will be created for any single contiguous sequence of text. For example, consider this somewhat contrived example:

```
I just LOVE Z<>hotE<32>apple pie!
```

When that is parsed and events are about to be called on it, it may actually seem to be four different text events, one right after another:

one event for "I just LOVE ", one for "hot", one for " ", and one for "apple pie!". But if you have `merge_text` on, then you're guaranteed that it will be fired as one text event: "I just LOVE hot apple pie!".

```
=item C<< $parser->code_handler( I<CODE_REF> ) >>
```

This specifies code that should be called when a code line is seen (i.e., a line outside of the Pod). Normally this is `undef`, meaning that no code should be called. If you provide a routine, it should start out like this:

```
sub get_code_line { # or whatever you'll call it
    my($line, $line_number, $parser) = @_;
    ...
}
```

Note, however, that sometimes the Pod events aren't processed in exactly the same order as the code lines are -- i.e., if you have a file with Pod, then code, then more Pod, sometimes the code will be processed (via whatever you have `code_handler` call) before the all of the preceding Pod has been processed.

```
=item C<< $parser->cut_handler( I<CODE_REF> ) >>
```

This is just like the `code_handler` attribute, except that it's for `"=cut"` lines, not code lines. The same caveats apply. `"=cut"` lines are unlikely to be interesting, but this is included for completeness.

```
=item C<< $parser->pod_handler( I<CODE_REF> ) >>
```

This is just like the `code_handler` attribute, except that it's for `"=pod"` lines, not code lines. The same caveats apply. `"=pod"` lines are unlikely to be interesting, but this is included for completeness.

```
=item C<< $parser->whiteline_handler( I<CODE_REF> ) >>
```

This is just like the `code_handler` attribute, except that it's for lines that are seemingly blank but have whitespace (" " and/or "\t") on them, not code lines. The same caveats apply. These lines are unlikely to be interesting, but this is included for completeness.

=item C<< \$parser->whine( I<linenumber>, I<complaint string> ) >>

This notes a problem in the Pod, which will be reported to in the "Pod Errors" section of the document and/or send to STDERR, depending on the values of the attributes C<no\_whining>, C<no\_errata\_section>, and C<complain\_stderr>.

=item C<< \$parser->scream( I<linenumber>, I<complaint string> ) >>

This notes an error like C<whine> does, except that it is not suppressible with C<no\_whining>. This should be used only for very serious errors.

=item C<< \$parser->source\_dead(1)

>>

This aborts parsing of the current document, by switching on the flag that indicates that EOF has been seen. In particularly drastic cases, you might want to do this. It's rather nicer than just calling C<die>!

=item C<< \$parser->hide\_line\_numbers( I<SOMEVALUE> ) >>

Some subclasses that indiscriminately dump event attributes (well, except for ones beginning with "~") can use this object attribute for refraining to dump the "start\_line" attribute.

=item C<< \$parser->no\_whining( I<SOMEVALUE> ) >>

This attribute, if set to true, will suppress reports of non-fatal error messages. The default value is false, meaning that complaints I<are> reported. How they get reported depends on the values of the attributes C<no\_errata\_section> and C<complain\_stderr>.

=item C<< \$parser->no\_errata\_section( I<SOMEVALUE> ) >>

This attribute, if set to true, will suppress generation of an errata section. The default value is false -- i.e., an errata section will be generated.

=item

C<< \$parser->complain\_stderr( I<SOMEVALUE> ) >>

This attribute, if set to true will send complaints to STDERR. The default value is false -- i.e., complaints do not go to STDERR.

=item C<< \$parser->bare\_output( I<SOMEVALUE> ) >>

Some formatter subclasses use this as a flag for whether output should have prologue and epilogue code omitted. For example, setting this to true for an HTML formatter class should omit the "`<html><head><title>...</title><body>...`" prologue and the "`</body></html>`" epilogue.

If you want to set this to true, you should probably also set `C<no_whining>` or at least `C<no_errata_section>` to true.

=item C<< \$parser->preserve\_whitespace( I<SOMEVALUE> ) >>

If you set this attribute to a true value, the parser will try to preserve whitespace in the output. This means that such formatting conventions as two spaces after periods will be preserved by the parser. This is primarily useful for output formats that treat whitespace as significant (such as text or \*roff, but not HTML).

=item C<< \$parser->parse\_empty\_lists( I<SOMEVALUE> ) >>

If this attribute is set to true, the parser will not ignore empty `C<=over>/C<=back>` blocks. The type of `C<=over>` will be `I<empty>`, documented above, `L<events with an element_name of over-empty>`.

=back

=head1 NAME

Pod::Simple::XMLOutputStream -- turn Pod into XML

=head1 SYNOPSIS

```
perl -MPod::Simple::XMLOutputStream -e \  
"exit Pod::Simple::XMLOutputStream->filter(shift)->any_errata_seen" \  
thingy.pod
```

=head1 DESCRIPTION

Pod::Simple::XMLOutputStream is a subclass of L<Pod::Simple> that parses

Pod and turns it into XML.

Pod::Simple::XMLOutputStream inherits methods from L<Pod::Simple>.

=head1 SEE ALSO

L<Pod::Simple::DumpAsXML> is rather like this class; see its documentation for a discussion of the differences.

L<Pod::Simple>, L<Pod::Simple::DumpAsXML>, L<Pod::SAX>

L<Pod::Simple::Subclassing>

The older (and possibly obsolete) libraries L<Pod::PXML>, L<Pod::XML>

=head1 ABOUT EXTENDING POD

TODO: An example or two of =extend, then point to Pod::Simple::Subclassing

=head1 ASK ME!

If you actually want to use Pod as a format that you want to render to XML (particularly if to an XML instance with more elements than normal Pod has), please email me (C<sburke@cpan.org>) and I'll probably have some recommendations.

For reasons of concision and energetic laziness, some methods and options in this module (and the dozen modules it depends on) are undocumented; but one of those undocumented bits might be just what you're looking for.

=head1 NAME

Pod::Simple::PullParserToken -- tokens from Pod::Simple::PullParser

=head1 SYNOPSIS

Given a \$parser that's an object of class Pod::Simple::PullParser  
(or a subclass)...

```

while(my $token = $parser->get_token) {
    $DEBUG and print "Token: ", $token->dump, "\n";
    if($token->is_start) {
        ...access $token->tagname, $token->attr, etc...

    } elsif($token->is_text) {
        ...access $token->text, $token->text_r, etc...

    } elsif($token->is_end) {
        ...access $token->tagname...

    }
}

```

(Also see L<Pod::Simple::PullParser>)

=head1

DESCRIPTION

When you do \$parser->get\_token on a L<Pod::Simple::PullParser>, you should  
get an object of a subclass of Pod::Simple::PullParserToken.

Subclasses will add methods, and will also inherit these methods:

=over

=item \$token->type

This returns the type of the token. This will be either the string "start", the string "text", or the string "end".

Once you know what the type of an object is, you then know what subclass it belongs to, and therefore what methods it supports.

Yes, you could probably do the same thing with code like `$token->isa('Pod::Simple::PullParserEndToken')`, but that's not so pretty as using just `$token->type`, or even the following shortcuts:

=item \$token->is\_start

This is a shortcut for `C<< $token->type() eq "start" >>`

=item \$token->is\_text

This is a shortcut for `C<< $token->type() eq "text" >>`

=item \$token->is\_end

This is a shortcut for `C<< $token->type() eq "end" >>`

=item \$token->dump

This returns a handy stringified value of this object.

This is useful for debugging, as in:

```
while(my $token = $parser->get_token) {  
    $DEBUG and print "Token: ", $token->dump, "\n";  
    ...  
}
```

=back

=head1 NAME

Pod::Simple::Search - find POD documents in directory trees

=head1 SYNOPSIS

```
use Pod::Simple::Search;
my $name2path = Pod::Simple::Search->new->limit_glob('LWP::*')->survey;
print "Looky see what I found: ",
    join(' ', sort keys %$name2path), "\n";

print "LWPUA docs = ",
    Pod::Simple::Search->new->find('LWP::UserAgent') || "?",
    "\n";
```

=head1 DESCRIPTION

B<Pod::Simple::Search> is a class that you use for running searches for Pod files. An object of this class has several attributes (mostly options for controlling search options), and some methods for searching based on those attributes.

The way to use this class is to make a new object of this class, set any options, and then call one of the search options (probably C<survey> or C<find>). The sections below discuss the syntaxes for doing all that.

=head1 CONSTRUCTOR

This class provides the one constructor, called C<new>.

It takes

no parameters:

```
use Pod::Simple::Search;
my $search = Pod::Simple::Search->new;
```

=head1 ACCESSORS

This class defines several methods for setting (and, occasionally, reading) the contents of an object. With two exceptions (discussed at the end of this section), these attributes are just for controlling the way searches are carried out.

Note that each of these return C<\$self> when you call them as C<< \$self->I<whatever(value)>>>. That's so that you can chain together set-attribute calls like this:

```
my $name2path =  
  Pod::Simple::Search->new  
  -> inc(0) -> verbose(1) -> callback(\&blab)  
  ->survey(@there);
```

...which works exactly as if you'd done this:

```
my $search = Pod::Simple::Search->new;  
$search->inc(0);  
$search->verbose(1);  
$search->callback(\&blab);  
my $name2path = $search->survey(@there);
```

=over

=item \$search->inc( I<true-or-false> );

This attribute, if set to a true value, means that searches should implicitly add perl's I<@INC> paths. This automatically

considers paths specified in the C<PERL5LIB> environment as this is prepended to I<@INC> by the Perl interpreter itself. This attribute's default value is B<TRUE>. If you want to search only specific directories, set \$self->inc(0) before calling \$inc->survey or \$inc->find.

=item \$search->verbose( I<nonnegative-number> );

This attribute, if set to a nonzero positive value, will make searches output (via C<warn>) notes about what they're doing as they do it.

This option may be useful for debugging a pod-related module.

This attribute's default value is zero, meaning that no C<warn> messages are produced. (Setting verbose to 1 turns on some messages, and setting it to 2 turns on even more messages, i.e., makes the following search(es) even more verbose than 1 would make them.)

=item \$search->limit\_glob( I<some-glob-string> );

This option means that you want to limit the results just to items whose podnames match the given glob/wildcard expression. For example, you might limit

your search to just "LWP::\*", to search only for modules starting with "LWP::\*" (but not including the module "LWP" itself); or you might limit your search to "LW\*" to see only modules whose (full) names begin with "LW"; or you might search for "\*Find\*" to search for all modules with "Find" somewhere in their full name. (You can also use

"?" in a glob expression; so "DB?" will match "DBI" and "DBD".)

```
=item $search->callback( I<\&some_routine> );
```

This attribute means that every time this search sees a matching Pod file, it should call this callback routine. The routine is called with two parameters: the current file's filespec, and its pod name. (For example: C<("/etc/perljunk/File/Crunk.pm", "File::Crunk")> would be in C<@\_>.)

The callback routine's return value is not used for anything.

This attribute's default value is false, meaning that no callback is called.

```
=item $search->laborious( I<true-or-false> );
```

Unless you set this attribute to a true value, Pod::Search will apply Perl-specific heuristics to find the correct module PODs quickly. This attribute's default value is false. You won't normally need to set this to true.

Specifically: Turning on this option will disable the heuristics for seeing only files with Perl-like extensions, omitting subdirectories that are numeric but do I<not> match the current Perl interpreter's version ID, suppressing F<site\_perl> as a module hierarchy name, etc.

```
=item $search->shadows( I<true-or-false> );
```

Unless you set this attribute to a true value, Pod::Simple::Search will consider only the first file of a given modulename as it looks thru the specified directories; that is, with this option off, if Pod::Simple::Search has seen a C<somepathdir/Foo/Bar.pm> already in this search, then it won't bother looking at a C<somelaterpathdir/Foo/Bar.pm> later on in that search, because that file is merely a "shadow". But if you turn on C<< \$self->shadows(1) >>, then these "shadow" files are inspected too, and are noted in the pathname2podname return hash.

This attribute's default value is false; and normally you won't need to turn it on.

```
=item $search->limit_re( I<some-regexp> );
```

Setting this attribute (to a value that's a regexp) means that you want to limit the results just to items whose podnames match the given regexp. Normally this option is not needed, and the more efficient C<limit\_glob> attribute is used instead.

```
=item $search->dir_prefix( I<some-string-value> );
```

Setting this attribute to a string value means that the searches should begin in the specified subdirectory name (like "Pod" or "File::Find", also expressible as "File/Find"). For example, the search option C<< \$search->limit\_glob("File::Find::R\*") >> is the same as the combination of the search options C<< \$search->limit\_re("^File::Find::R") -> dir\_prefix("File::Find") >>.

Normally you don't need to know about the C<dir\_prefix> option, but I include it in case it might prove useful for someone somewhere.

(Implementationally, searching with limit\_glob ends up setting limit\_re and usually dir\_prefix.)

```
=item $search->progress( I<some-progress-object> );
```

If you set a value for this attribute, the value is expected to be an object (probably of a class that you define) that has a C<reach> method and a C<done> method. This is meant for reporting progress during the search, if you don't want to use a simple callback.

Normally you don't need to know about the C<progress> option, but I include it in case it might prove useful for someone somewhere.

While a search is in progress, the progress object's C<reach> and C<done> methods are called like this:

```
# Every time a file is being scanned for pod:
$progress->reach($count, "Scanning $file"); ++$count;

# And then at the end of the search:
$progress->done("Noted $count Pod files total");
```

Internally, we often set this to an object of class Pod::Simple::Progress. That class is probably undocumented, but you may wish to look at its source.

```
=item $name2path
= $self->name2path;
```

This attribute is not a search parameter, but is used to report the result of C<survey> method, as discussed in the next section.

```
=item $path2name = $self->path2name;
```

This attribute is not a search parameter, but is used to report the result of C<survey> method, as discussed in the next section.

```
=back
```

```
=head1 MAIN SEARCH METHODS
```

Once you've actually set any options you want (if any), you can go ahead and use the following methods to search for Pod files in particular ways.

```
=head2 C<< $search->survey( @directories ) >>
```

The method C<survey> searches for POD documents in a given set of files and/or directories. This runs the search according to the various options set by the accessors above. (For example, if the C<inc> attribute is on, as it is by default, then the perl @INC directories are implicitly added to the list of directories (if any) that you specify.)

The return value of C<survey> is two hashes:

```
=over
```

```
=item C<name2path>
```

A hash that maps from each pod-name to the filespec (like "Stuff::Thing" => "/whatever/plib/Stuff/Thing.pm")

```
=item C<path2name>
```

A hash that maps from each Pod filespec to its pod-name (like "/whatever/plib/Stuff/Thing.pm" => "Stuff::Thing")

```
=back
```

Besides saving these hashes as the hashref attributes C<name2path> and C<path2name>, calling this function also returns these hashrefs. In list context, the return value of

C<< \$search->survey >> is the list C<(\%name2path, \%path2name)>.

In scalar context, the return value is C<\%name2path>.

Or you can just call this in void context.

Regardless of calling context, calling C<survey> saves its results in its C<name2path> and C<path2name> attributes.

E.g., when searching in F<\${HOME}/perl5lib>, the file F<\${HOME}/perl5lib/MyModule.pm> would get the POD name I<MyModule>, whereas F<\${HOME}/perl5lib/Myclass/Subclass.pm> would be I<Myclass::Subclass>. The name information can be used for POD translators.

Only text files containing at least one valid POD command are found.

In

verbose mode, a warning is printed if shadows are found (i.e., more than one POD file with the same POD name is found, e.g. F<CPAN.pm> in different directories). This usually indicates duplicate occurrences of modules in the I<@INC> search path, which is occasionally inadvertent (but is often simply a case of a user's path dir having a more recent version than the system's general path dirs in general.)

The options to this argument is a list of either directories that are searched recursively, or files. (Usually you wouldn't specify files, but just dirs.) Or you can just specify an empty-list, as in \$name2path; with the C<inc> option on, as it is by default, teh

The POD names of files are the plain basenames with any Perl-like extension (.pm, .pl, .pod) stripped, and path separators replaced by C<::>'s.

Calling Pod::Simple::Search->search(...) is short for Pod::Simple::Search->new->search(...). That is, a throwaway object with default attribute values is used.

```
=head2 C<<
$search->simplify_name( $str ) >>
```

The method B<simplify\_name> is equivalent to B<basename>, but also strips Perl-like extensions (.pm, .pl, .pod) and extensions like F<.bat>, F<.cmd> on Win32 and OS/2, or F<.com> on VMS, respectively.

```
=head2 C<< $search->find( $pod ) >>
```

```
=head2 C<< $search->find( $pod, @search_dirs ) >>
```

Returns the location of a Pod file, given a Pod/module/script name (like "Foo::Bar" or "perlvar" or "perldoc"), and an idea of what files/directories to look in.

It searches according to the various options set by the accessors above. (For example, if the C<inc> attribute is on, as it is by default, then the perl @INC directories are implicitly added to the list of directories (if any) that you specify.)

This returns the full path of the first occurrence to the file.

Package names (eg 'A::B') are automatically converted to directory names in the selected directory. Additionally, '.pm', '.pl' and '.pod' are automatically appended to the search as required.

(So, for

example, under Unix, "A::B" is converted to "somedir/A/B.pm", "somedir/A/B.pod", or "somedir/A/B.pl", as appropriate.)

If no such Pod file is found, this method returns undef.

If any of the given search directories contains a F<pod/> subdirectory, then it is searched. (That's how we manage to find F<perlfunc>, for example, which is usually in F<pod/perlfunc> in most Perl dists.)

The C<verbose> and C<inc> attributes influence the behavior of this search; notably, C<inc>, if true, adds @INC I<and also \$Config::Config{'scriptdir'}> to the list of directories to search.

It is common to simply say C<< \$filename = Pod::Simple::Search->new->find("perlvar") >> so that just the @INC (well, and scriptdir) directories are searched. (This happens because the C<inc> attribute is true by default.)

Calling Pod::Simple::Search->find(...) is short for Pod::Simple::Search->new->find(...). That is, a throwaway object with default attribute values is used.

```
=head2 C<< $self->contains_pod( $file  
) >>
```

Returns true if the supplied filename (not POD module) contains some Pod documentation.

```

# TODO: let it be an option whether a given subclass even wants little treelets?

\_\_END\_\_

=head1 NAME

Pod::Simple::LinkSection -- represent "section" attributes of L codes

=head1 SYNOPSIS

# a long story

=head1 DESCRIPTION

This class is not of interest to general users.

Pod::Simple uses this class for representing the value of the "section" attribute of "L" start-element events. Most applications can just use the normal stringification of objects of this class; they stringify to just the text content of the section, such as "foo" for C<< LZ<><Stuff/foo> >>, and "bar" for C<< LZ<><Stuff/bIZ<><ar>> >>.

However, anyone particularly interested in getting the full value of the treelet, can just traverse the content of the treelet @\$treelet\_object. To wit:

```
% perl -MData::Dumper -e
"use base qw(Pod::Simple::Methody);
sub start_L { print Dumper($_[1]{'section'}) }
__PACKAGE__->new->parse_string_document('=head1
L<Foo/bI<ar>baz>>')
"
```

Output:

```
$VAR1 = bless( [
    ",
    {},
    'b',
    bless( [
        'I',
        {},
        'ar'
    ], 'Pod::Simple::LinkSection' ),
    'baz'
], 'Pod::Simple::LinkSection' );
```

But stringify it and you get just the text content:

```
% perl -MData::Dumper -e
"use base qw(Pod::Simple::Methody);
sub start_L { print Dumper(" . $_[1]{ 'section' } ) }
__PACKAGE__->new->parse_string_document('=head1 L<Foo/bI<ar>baz>>')
"
```

Output:

```
$VAR1 = 'barbaz';
```

=head1 NAME

Pod::Simple::PullParserEndToken -- end-tokens from Pod::Simple::PullParser

=head1 SYNOPSIS

(See L<Pod::Simple::PullParser>)

=head1 DESCRIPTION

When you do `$parser->get_token` on a L<Pod::Simple::PullParser>, you might get an object of this class.

This is a subclass of L<Pod::Simple::PullParserToken> and inherits all its methods, and adds these methods:

=over

=item `$token->tagname`

This returns the tagname for this end-token object.  
For example, parsing a "`=head1 ...`" line will give you a start-token with the tagname of "head1", token(s) for its content, and then an end-token with the tagname of "head1".

=item `$token->tagname(I<somestring>)`

This changes the tagname for this end-token object.  
You probably won't need to do this.

=item \$token->tag(...)

A shortcut for \$token->tagname(...)

=item \$token->is\_tag(I<somestring>) or \$token->is\_tagname(I<somestring>)

These are shortcuts for C<< \$token->tag()

eq I<somestring> >>

=back

You're unlikely to ever need to construct an object of this class for yourself, but if you want to, call

C<<

Pod::Simple::PullParserEndToken->new( I<tagname> )

>>

=head1 NAME

Pod::Simple::PullParserStartToken -- start-tokens from Pod::Simple::PullParser

=head1 SYNOPSIS

(See L<Pod::Simple::PullParser>)

=head1 DESCRIPTION

When you do `$parser->get_token` on a L<Pod::Simple::PullParser> object, you might get an object of this class.

This is a subclass of L<Pod::Simple::PullParserToken> and inherits all its methods, and adds these methods:

=over

=item `$token->>tagname`

This returns the tagname for this start-token object.

For example, parsing a "`=head1 ...`" line will give you a start-token with the tagname of "head1", token(s) for its content, and then an end-token with the tagname of "head1".

```
=item $token->tagname(I<somestring>)
```

This changes the tagname for this start-token object.  
You probably won't need  
to do this.

```
=item $token->tag(...)
```

A shortcut for `$token->tagname(...)`

```
=item $token->is_tag(I<somestring>) or $token->is_tagname(I<somestring>)
```

These are shortcuts for

```
C<< $token->tag() eq I<somestring> >>
```

```
=item $token->attr(I<attrname>)
```

This returns the value of the `I<attrname>` attribute for this start-token object, or `undef`.

For example, parsing a `LZ<><Foo/"Bar">` link will produce a start-token with a "to" attribute with the value "Foo", a "type" attribute with the value "pod", and a "section" attribute with the value "Bar".

```
=item $token->attr(I<attrname>, I<newvalue>)
```

This sets the `I<attrname>` attribute for this start-token object to `I<newvalue>`. You probably won't need to do this.

```
=item $token->attr_hash
```

This returns the hashref that is the attribute set for this start-token. This is useful if (for example) you want to ask what all the attributes are -- you can just do `C<< keys %{$token->attr_hash} >>`

```
=back
```

You're unlikely to ever need to construct an object of this class for yourself, but if you want to, call

```
C<<  
Pod::Simple::PullParserStartToken->new( I<tagname>, I<attrhash> )  
>>
```

```

=head1 NAME

Pod::Simple::DumpAsXML -- turn Pod into XML

=head1 SYNOPSIS

```
perl -MPod::Simple::DumpAsXML -e \  
"exit Pod::Simple::DumpAsXML->filter(shift)->any_errata_seen" \  
thingy.pod
```

=head1 DESCRIPTION

Pod::Simple::DumpAsXML is a subclass of L<Pod::Simple> that parses Pod and turns it into indented and wrapped XML. This class is of interest to people writing Pod formatters based on Pod::Simple.

Pod::Simple::DumpAsXML inherits methods from L<Pod::Simple>.

=head1 SEE ALSO

L<Pod::Simple::XMLOutputStream> is rather like this class.

Pod::Simple::XMLOutputStream's output is space-padded in a way that's better for sending to an XML processor (that is, it has no ignorable whitespace). But

Pod::Simple::DumpAsXML's output is much more human-readable, being (more-or-less) one token per line, with line-wrapping.

L<Pod::Simple::DumpAsText> is rather like this class, except that it doesn't dump with XML syntax. Try them and see which one you like best!

L<Pod::Simple>, L<Pod::Simple::DumpAsXML>

The older libraries L<Pod::PXML>, L<Pod::XML>, L<Pod::SAX>

# ChangeLog for Pod::Simple dist

#-----

2013-05-04 David E. Wheeler <david@justatheory.org>

\* Release 3.28

Removed use of 'done\_testing' in t/white.t, which was added in v3.27. Thanks to Paul Howarth for the catch.

Fixed improperly calculated number of skipped tests in t/xhtml101.t when HTML::Entities is not installed.

2013-05-03 David E. Wheeler <david@justatheory.org>

\* Release 3.27

Added new warnings as defined by Pod::Checker, thanks to RJBS:

+ "=over" without "=back"

+ "L<>" starts or ends with whitespace

+ raw "|" or "/" in "L<text|link>" text

Added ->keep\_encoding\_directive, which is false by default, to prevent formatters from emitting a document's '=encoding' directive in most cases. That they emitted the encoding was a bug introduced in v3.26 (RT #84093). Now, only the DumpAsText and DumpAsXML formats set it to true.

Patch from Patrice Dumas.

2013-02-27 David E. Wheeler <david@justatheory.org>

\* Release 3.26

Fixed another test script to skip all tests when Encode is not installed.

Added 'encoding()' and 'detected\_encoding()' to return the current encoding and the encoding actually to decode the input file. The value from "=encoding" is also now kept in the output tree. Patch from Patrice Dumas (RT #74390).

2013-02-16 David E. Wheeler <david@justatheory.org>

\* Release 3.25

Improved the warning when "=item" types mismatch within one "=over"/"=back" block.

2013-02-14 David E. Wheeler <david@justatheory.org>

\* Release 3.24

Fixed corner case bug for unlikely scenario in which non-UTF-8

text could be parsed as UTF-8. Grant McLean.

XHTML IDs can no longer end with punctuation. Thanks to Smylers for the patch.

Fixed test failure on Perl 5.6.2.

Changed the default installation location from "perl" to "site" on 5.12 and higher, since as of that version of Perl, dual-life modules no longer need to be installed in "perl" to replace in-core versions. Patch from tzccinct.

Fixed hash order dependency test failures on Perl 5.17. Thanks to Yves Orton for the patch.

Inlined the code that tries to guess a Pod file's encoding. This reduces the time Pod::Simple takes to build the core Perl documentation by 15-20%. Thanks to Dagfinn Ilmari Mannsåker for the patch!

Added a warning when "=item" types mismatch within one "=over"/"=back" block. Marc Green/Google Summer of Code, with assist from RJBS.

Fixed regression introduced in 3.22 in which "C<>" tags were incorrectly treated as verbatim text in table of contents items emitted by Pod::Simple::XHTML. Thanks to Randy Stauner for the report and to Thomas Sibley for the fix!

Loosened up the matching of "L<>" tags for man pages so that they allow names with dots, underscores, and any other characters other than "/", just so long as they end in '([[-a-zA-Z0-9]+)]'. Thanks to Dave Rolsky and Kevin Ryde for the reports (RT #82975 & RT #82972).

Fixed inverted mapping of "keyboard" to "kbd" in Pod::Simple::HTML. Thanks to Robert Boisvert for the bug report (RT #79201).

Added two new Tagmap entries to Pod::Simple::HTML: "preformat" maps to "pre", and "teletype" maps to "tt". Suggested by Robert Boisvert (RT #79201).

"X<>" tags are now ignored by the pull parser when it searches for titles, as is any trailing whitespace. Thanks to Patrice Dumas for the report (RT #74389).

2012-08-14 David E. Wheeler <david@justatheory.org>

\* Release 3.23

Eliminated nested elements in table of contents (index) items output of Pod::Simple::XHTML. This was especially problematic for headers that included links, as the TOC then got nested anchor elements, which simply would not work. Thanks to Ben Bullock for the report and test case (RT #77686).

Fixed semantically invalid nested XHTML generated by Pod::Simple::XHTML since v3.21. Gisle Aas.

Improved support for nested "C<>" tags in Pod::Simple::XHTML. Gisle Aas.

No longer tries to decode a string with the "utf8" flag set, as the double-decoding only triggered an error. Grant McLean.

Added documentation note that the API expects encoded text (octets). Grant McLean.

Added "parse\_characters()" option to specify that strings to are already decoded from octets into characters. Grant McLean.

2012-05-27 David E. Wheeler <david@justatheory.org>

\* Release 3.22

Fix but where Pod::Simple would whine about non-ASCII bytes in code or comments. Now only does so for Pod (in the absence of an "=encoding" tag. Broken in 3.21. Grant McLean.

2012-05-23 David E. Wheeler <david@justatheory.org>

\* Release 3.21

NOTE: COMPATABILITY CHANGE: The 'codes\_in\_verbatim' option in Pod::Simple::XHTML is no longer enabled by default. This brings it agreement with the other formatting classes, and eliminates unexpected behavior in XHTML-formatted Pod. Users who depended on this functionality can still get it by enabling 'codes\_in\_verbatim' in their code.

Fixed some typos in the documentation. Thanks to Jonathan Yu via the Debian packagers via Florian Ragwitz (RT #75532).

Now emit a warning the first time a non-ASCII byte is encountered

when no "`=encoding`" has been seen. Grant McLean.

When a non-ASCII byte is encountered before an "`=encoding`" line has been seen, a heuristic (as described in `perlpodspec`) is applied to select UTF-8 encoding if the non-ASCII bytes form a valid UTF-8 byte sequence, or Latin-1 otherwise. Grant McLean.

Added `handle_code` method to `Pod::Simple::XHTML`. This allows subclasses to override the handling of verbatim blocks, and makes for a more cohesive interface, to boot. Gisle Aas.

Subsequent text segments are now joined together and passed as a single unit to text handling code. This makes it easier for custom handlers to process complete blocks of text in a single call to `handle_text`, rather than in dribs and drabs. Gisle Aas.

Replaced naive text wrapping code in `Pod::Simple::DumpAsXML` with `Text::Wrap`, which was already used for similar purposes elsewhere in `Pod::Simple`. Gisle Aas.

2012-03-01 David E. Wheeler <david@justatheory.org>

\* Release 3.20

Removed use of `done_testing` in `t/xhtml15.t`, which was added in v3.19. Thanks to Paul Howarth for the catch.

Fixed quoting of links in a regular expression `Pod::Simple::Text`. Reported by Father Chrysostomos.

Fix test failure on case-insensitive, non-case-preserving file systems (VMS I'm looking at `*you*`). Patch from Craig A. Berry.

`Pod::Simple::HTML` no longer emits "`href='#__top'`" if a TOC (index) is not output. Patch from Rick Myers.

Fixed links in the TOC of XHTML output to use IDs derived from encoded text, rather than raw Pod, so that it will link to the ID actually generated for the section. Thanks to Randy Stauner for the report (with test case!) (RT #72544).

`PullParser` now throws an exception on an attempt to set a source more than once. Necessary because data from the previous source will be cached, so the new source would be ignored anyway. Create a new `PullParser`, instead. Thanks to Paul Boldra for the report (RT #74265).

2011-08-23 David E. Wheeler <david@justatheory.org>

\* Release 3.19

Fixed occasional test failure when tests are run in parallel (HARNESS\_OPTIONS=j6:c). Thanks to Alexei Znamensky for the report and Marc Green for the fix.

Added "pod\_handler" option. This is a callback that can be used to inspect the content on a "=pod" line. Marc Green/Google Summer of Code.

Added tests for proper line-ending parsing from the previous release. The tests were in the repository, but didn't make it into the MANIFEST or, therefore, the release. Reported by Marc Green.

Added the "parse\_empty\_lists" option. When enabled, Pod::Simple will recognize empty lists (that is, a blocks with '=over' and '=back' but nothing in between). Disabled by default. Marc Green/Google Summer of Code.

Added the "whiteline\_handler" attribute. It's much like "code\_handler", "cut\_handler", and "pod\_handler", except it's triggered on lines that contain only whitespace characters. Marc Green/Google Summer of Code.

Added "raw" attribute to L<> treelet that contains the L<>'s raw contents. Marc Green/Google Summer of Code.

Pod directives autoclosed by Pod::Simple are now denoted as such by the new "fake\_closer" attribute. Marc Green/Google Summer of Code.

Fixed incompatibility with Pod::Simple::HTMLBatch in Pod::Simple::XHTML. Patch by Eric Johnson.

2011-07-16 David E. Wheeler <david@justatheory.org>

\* Release 3.18

Pod::Simple now properly parses Pod files using Mac OS Classic line-endings (r). Marc Green/Google Summer of Code.

Fixed test failure in 't/search50.t' when the test finds a .pod but the module is in a .pm. Thanks to the cpan-testers who reported this when the test searched for Capture::Tiny.

2011-07-09 David E. Wheeler <david@justatheory.org>

\* Release 3.17

Documented

tertiary methods. Patch from Shawn H Corey.

Added "backlink" option to Pod::Simple::XHTML. Thanks to Marc Green/Google Summer of Code for the pull request.

Typos fixed in Pod::Simple::HTMLBatch. Reported by Shawn H Corey.

Fixed quoting of value returned by a "strip\_verbatim\_indent()" code reference so that regex meta characters are properly escaped.

Added "anchor\_items" option to Pod::Simple::XHTML. This allows text items (which are output as <dt> elements) to have IDs that can be referenced in the "#" part of a URL. Marc Green/Google Summer of Code.

Added "recurse" option to Pod::Simple::Search. It's enabled by default; disable it to turn off recursion into subdirectories. Marc Green/Google Summer of Code.

Added documentation to clarify the behavior of the "content\_seen" method. Thanks to Olaf Alders for the pull request.

2011-03-14 David E. Wheeler <david@justatheory.org>

\* Release 3.16

Fixed invalid HTML generated for nested lists by Pod::Simple::XHTML (Fitz Elliott).

Replaced the invalid "<nobr>" tag -- created for "S<>" -- with '<span style="white-space: nowrap;">' (Fitz Elliott).

Fixed some nerbles in our own Pod (Michael Stevens)

Improved the "Minimal code" example in Pod::Simple::HTML. The key is to use `pase_file()`, not `parse_from_file()` (which should otherwise be undocumented, and is just there for Pod::Parser compatibility. Thanks to prodding from Ævar Arnfjörð Bjarmason (RT #65428).

Added the `html_charset()` and `html_encode_chars()` attributes to Pod::Simple::XHTML. Inspired by a bug report from Agent Zhang () (RT #29587).

Added "Minimal code" example to the Pod::Simple::XHTML documentation.

Fixed misspelling of the "=encoding" markup in the parser (it was spelled "=encode"). Thanks to "TTY" for the patch. (RT #24820).

2010-11-11 David E. Wheeler <david@justatheory.org>

\* Release 3.15

Removed "perlpod.pod" and "perlpodspec.pod". These now just live in the Perl core.

Fixed stylesheet names output by HTMLBatch to match the names of the actual stylesheet files (broken in 3.09). Thanks to Kevin Ryde for the report (RT #56725).

Added missing closing slash to the CSS links in the XHTML output. Thanks to HarleyPig for the patch!

Added parens around bar "qw(...)" in t/xhtml05.t. Thanks to Jerry D. Hedden for the patch.

Improved the Pod::Simple::HTML docs. Thanks to Gabor Szabo for the patch.

Pod::Simple::XHTML now properly encodes entities in URLs in the anchor tag. Thanks to John McNamara for the report (RT-60249).

Pod::Simple::HTML and XHTML now strip whitespace from the end of section names that appear as anchor names for headers (in HTML) and IDs (in XHTML). Such whitespace appeared when "X<>" entities were stripped out but not the space between them (RT-56572).

Make test "t/search50.t" always pass on case-insensitive file systems rather than just skip VMS.

2009-04-27

\* Release 3.14

Removed explicit loading of UNIVERSAL. RJBS.

Reversed the change applied in release 3.09 to fix RT #12239. POD tag found inside a complex POD tag (e.g., "C<<< I<foo> >>>") is again parsed as a tag embedded in a tag instead of text and entities. The previous interpretation of `perldoc perlpod` was mistaken. (RT #55602 from Christopher J. Madsen).

2009-12-17 David E. Wheeler <david@justatheory.org>

\* Release 3.13

Removed deleted test file from MANIFEST.

2009-12-17 David E. Wheeler <david@justatheory.org>

\* Release 3.12

Removed "All rights reserved" from all files.

Added acknowledgements to man.he.net and search.cpan.org for permission to link man pages and Perl module links to their sites in the output of Pod::Simple::HTML and Pod::Simple::XHTML.

Add "html\_h\_level" option to Pod::Simple::XHTML and ::HTML to allow a =head1 to become an <h2> and so on. RJBS.

Add batch\_mode\_page\_object\_init() method to Pod::Simple::XHTML. This allows it to be used by Pod::Simple::HTMLBatch.

Fixed a regression in Pod::Simple::XHTML where '=begin html' blocks were incorrectly escaped rather than simply passed through unmolested. RJBS.

Removed the undocumented "fullstop\_space\_harden" attribute, which apparently was only used by Pod::Text a very long time ago.

2009-12-09 David E. Wheeler <david@justatheory.org>

\* Release 3.11

Restored code to HTMLBatch that allows the TOC (index) to be created in batch jobs (RT #52324 from Martin J. Evans).

Added resources to META.yml, including bug tracker, license, and repository.

Turned man page links into links to man.he.net in Pod::Simple::HTML and Pod::Simple::XHTML output. Subclass and override resolve\_man\_page\_link() to use a different URL.

Added the resolve\_pod\_page\_link() and resolve\_man\_page\_link() methods to Pod::Simple::XHTML to make it easier for subclasses to change the URLs created for POD and man page links.

Fixed the output of entities in L<> tags by Pod::Simple::XHTML.

Fixed the output of POD links from Pod::Simple::XHTML so that the section part (/foo) is

turned into a proper fragment identifier (#foo)  
in the resulting search.cpan.org link.

Pod::Simple::Text now outputs URLs for links created in the  
L<text|URL> format. For example, L<Perl|http://perl.org> is now  
output as "Perl <http://perl.org>" rather than just as "Perl".

Updated perlpod.pod and perlpodspec.pod to sync up with Perl core  
(and to be released in Perl 5.12). Changes include:

- \* Removing the prohibition against L<text|href>
- \* Deprecation of L<section> and L<"section">
- \* Legalization of "=begin formatname parameter"

A couple of bug fixes in Pod::Simple::HTML from Graham Barr.

Added the do\_section() method to Pod::Simple::HTML. Graham Barr.

Word-smithed the "DESCRIPTION" a bit and wrote the README.

Synced up all module version numbers to 3.11 except for  
Pod::Simple::HTMLLegacy, which is at 5.01 and should not have its  
version number lowered.

2009-11-12 David E. Wheeler <david@justatheory.org>

\* Release 3.10

Converted test files that had DOS endings  
to have Unix endings  
(RT #50922 from Steve Hay).

Skip tests on VMS where the lack of filename case preservation can  
wreak havoc (RT #51184 from Craig A. Berry).

Fix nested definition list format in the XHTML output  
(RT #51187 from Lars D).

Added some files missing from the MANIFEST (and therefore the  
distribution) in the last two releases.

2009-10-27 Allison Randal <allison@perl.org>

\* Release 3.09

Add support for an index (TOC) in the XHTML output from David E.  
Wheeler.

Add strip\_verbatim\_indent() from David E. Wheeler.

Added the "nocase" option to PullParser's get\_title(),

get\_version(), get\_description(), and get\_author() methods. This allows one to fetch the contents of those sections regardless of the case of the labels (e.g., "NAME" and "Name" and "name" are all valid). Graham Barr.

Added the search\_class() accessor to Pod::Simple::HTMLBatch.  
David E. Wheeler.

XHTML output now properly encodes entities in all places, not just in verbatim blocks and code spans. David E. Wheeler.

Fixed XHTML to output definition lists when it should, rather than (broken) unordered lists. David E. Wheeler.

Fixed XHTML so that multiparagraph list items work correctly.  
David E. Wheeler.

Fixed XHTML ordered list output so that it does not include the number specified in the POD in the output. This is on a par with out the HTML output works. David E. Wheeler.

Applied URL patch from Leon Brocard for The Perl Journal archives.

Fixed test failures with older versions of HTML::Entities (RT #43903 from Salvador Tercia).

Changed CSS files generated by HTMLBatch to be no more than 8.3 characters long. (RT #40450 from Renee Baecker)

Added entity handling for E<sol> and E<verbar> to Pod::Simple::XHTML. (RT #49615 from Chas Owens.)

Fixed a bug in Pod::Simple::HTML where a definition term item with no corresponding definition item would be output with no closing </a></dt>. (RT # 37107 from Kevin Ryde).

Added entity handling for numeric entities to Pod::Simple::XHTML, following perlpod specification.

A POD tag found inside a complex POD tag (e.g., "C<<< C<foo> >>>") is now properly parsed as text and entities instead of a tag embedded in a tag. This is in compliance with `perldoc perlpod` (RT #12239 from Michael Schwern).

Thanks to David E. Wheeler for applying patches, resolving bugs, and generally getting ready for the release.

2009-07-16 Allison Randal <allison@perl.org>

\* Release 3.08

Fix installdirs for Perl versions where Pod::Simple was core;  
RT#36446 & RT#39709, thanks to Jerry Hedden.

Fix encoding handling for code in paragraphs; RT#45829, thanks  
to David Wheeler.

2008-06-04 Allison Randal <allison@perl.org>

\* Release 3.07

Fix module dependencies, make HTML::Entities optional and require  
Test::More.

2008-06-03 Allison Randal <allison@perl.org>

\* Release 3.06

Fix bugs related to passing \$1 to File::Spec, reported by Andrew Hamlin and  
John McNamara.

Applied a suggested  
fix from Kevin Ryde to return a successful exit  
code when Pod::Simple::HTML is run from the command line.

Fix handling of complex L<URL> entries, thanks to tests supplied in RT#4896.

Fix incorrect handling of S<> entries made up of entirely whitespace, thanks  
to test case from Andreas Koenig.

Launch Pod::Simple::XHTML, an XHTML compliant, more easily extensible  
HTML formatter.

Add feature to parse additional text after =begin target as a block  
title, requested by Adam Kennedy.

Thanks to Hans Dieter Pearcey for applying patches, resolving bugs,  
and generally getting ready for the release.

2007-03-03 Allison Randal <allison@perl.org>

\* Release 3.05

Standardized all test files on 8.3 naming scheme for Perl core.

Applied test patches from Jerry Hedden for Perl core when  
Encode not installed.

Applied test patch from Ken Williams for 5.005\_04 compatibility.

Applied a patch from Christopher Madsen to fix architecture directory searches on Gentoo.

Fixed a failing search test on Debian-based distributions caused by Debian stripping Pod documentation out of core modules. (Three cheers to the CPAN testers and James Ponza for sending enough reports that I could work out the pattern.)

2006-01-18 Allison Randal <allison@perl.org>  
\* Release 3.04

Applied test patches for Perl core integration from Steve Peters.

Added a 'reinit' method to Pod::Simple::BlackBox for Russ Allbery so Pod::Man can provide backward compatibility to existing users (such as Module::Build and ExtUtils::MakeMaker).

Applied patch for extracting case-preserved package names on VMS from Craig Berry.

2005-11-21 Allison Randal <allison@perl.org>  
\* Release 3.03

Applied whitespace patches for Pod::Man and Pod::Text from Russ Allbery.

Applied validation patches to Pod::Simple::HTML from Graham Barr.

2004-05-24 Sean M. Burke <sburke@cpan.org>  
\* Release 3.02

Just fixing some typos in the CSS generated by Pod::Simple::HTMLBatch.

2004-05-24 Sean M. Burke <sburke@cpan.org>  
\*  
Release 3.01

No big changes to the main modules, but there's many changes to the important Pod::Simple::HTML module.

Also, new modules:  
Pod::Simple::HTMLBatch  
Pod::Simple::HTMLLegacy  
Pod::Simple::Progress  
Pod::Simple::Search

and tests for these (well, most).

Some prettying up of the Makefile.PL.

The test 00about.t is a bit more careful and verbose now.

The docs are still incomplete, esp. for Pod::Simple::HTML and Pod::Simple::HTMLBatch, which I hope to improve quite soon.

2004-05-07 Sean M. Burke <sburke@cpan.org>  
\* Release 2.06

Allison Randal brilliantly refactors a huge monolithic sub in Blackbox.pm. Code is now actually sanely readable!

I add the new option-attributes fullstop\_space\_harden and codes\_in\_verbatim, and the two methods abandon\_output\_string and abandon\_output\_fh. Not yet documented.

New test fullstop\_spaces.t and new corpus document greek\_iso\_8859\_7.pod.

Another version should be forthcoming in a few days that has the new Pod::Simple::HTML stuff in it.

Note to self: document =extend and =encoding in perlpodspec ASAP!

2003-11-04 Sean M. Burke <sburke@cpan.org>  
\* Release 2.05 -- bugfix version

In an attempt to stop Perl 5.6 versions from going completely crazy, I've tried to basically turn off all Unicode/utf8 support under 5.6. Under 5.8 and above, Unicode should work fine, and under 5.6, all Unicode characters should be replaced with a little "can't render" symbol, either a "␣" or a "?".

Many many thanks to Jarkko Hietaniemi for helping out.

(Works under 5.005 now too?)

2003-10-10 Sean M. Burke <sburke@cpan.org>  
\* Release 2.04 -- minor bugfix version

\* Added some code to insulate Pod::Simple to runtime changes in the value of \$/. Thanks to Iain Truskett for catching this.

\* Added FILENO method to TiedOutFH.pm, to work quietly under some perls. Thanks to Jochen Stenzel for catching this.  
\* Fixed some tests that erroneously failed under some 5.6's because of chdir(s) in \*.t files messing up @INC Thanks to many who caught this, including Rocco Caputo.

2003-09-07 Sean M. Burke <sburke@cpan.org>

\* Release 2.03 -- minor upgrade  
\* A =head[1234] command now closes any currently open =over, and warns.  
\* Fixing a few obscure bugs, including one to do with the Makefile.  
\* Added some tests for those bugs.

2003-09-02 Sean M. Burke <sburke@cpan.org>

\* Release 2.02 -- fixing a testing bug  
\* Autrijus Tang found a silly bug of mine in corpustest.t's testing of corpus/t/nonesuch.txt. Fixed,  
\* I add encoding\_nonesuch.t to test corpus/t/nonesuch.txt better.

2003-09-01 Sean M. Burke <sburke@cpan.org>

\* Release 2.01  
\* Moved all version numbers up to 2.01 for reasons of Tibetan numerology.  
  
\* Implemented =encoding. Thanks a million to Jarkko, Autrijus, Dan Kogai, and many others for their help, patience, and encouragement.

It's not yet documented, but see ./t/corpus/\*.txt for examples at least.

\* Added 'use utf8' to all the modules. Byebye perl-5.005 compatibility, hello decent perl-5.6 compatibility.

-----  
2003-09-01 Sean M. Burke <sburke@cpan.org>

\* Release 0.98  
\* At Michael Schwern's suggestion, a list that begins with a "=item [number]" line where number isn't a 1, is no longer treated as an error, but instead is silently coerced into being a text-item list, just as if it were "=item wubble" or whatever.

2003-08-12 Sean M. Burke <sburke@cpan.org>

- \* Release 0.97
- \* Looking goooooood. Not smelling so much like beta anymore!
- \* I think this might be the last version before I go putting "use utf8" all over the place.

- \* Added placeholders for "=encoding" support. If you use "=encoding", you'll get an error about "not yet implemented" instead of "unknown directive".

- \* Rewrote Pod::Simple::PullParser's get\_title, and added get\_version, get\_author, and get\_description. Documented them. Thanks to Graham Barr for contributing an initial get\_title and then being patient while I seemed to do nothing with it for months on end!

- \* More tests.

Otherwise just minor changes since last version:

- \* Fixed error in Pod::Simple::RTF.
- \* Added new but undocumented methods to Pod::Simple:
  - unaccept\_directive(s) unaccept\_target(s) unaccept\_code(s)
- \* Corrected '=back without =open' error to '=back without =over'
- \* A little tweaking to the \_verbatim\_format code.
- \* Dump routines may use \x{NN} instead of \xNN format.
- \* Pod::Simple::HTML now uses VerbatimFormatted
- \* A few changes of DEBUG messages -- nothing you'd normally see.

2002-11-19 Sean M. Burke <sburke@cpan.org>

- \* Release 0.96
- \* Still kinda sorta beta.

- \* Much much more docs in this version. Only a few feature changes:

- \* Added any\_errata\_seen to Pod::Simple. Should've been in there ages ago. Oops!
- \* Fixed some errors in the experimental VerbatimFormatted code.
- \* Added is\_tagname / is\_tag to Pod::Simple::PullParserStartToken and Pod::Simple::PullParserEndToken
- \* Added RTFDEFLANG stuff to Pod::Simple::RTF.

2002-11-10 Sean M. Burke <sburke@cpan.org>

- \* Release 0.95
- \* Beta release. Much documentation still to write, many features still to add. The APIs might change in future versions.

\* Now including perlpod and perlpodspec in the dist.

\* Pod::Simple -- added parse\_from\_file

\* Pod::Simple::RTF -- minor style changes, and minor change to the RTF-wrapping logic.

\* Pod::Simple::BlackBox -- a =cut opening a block is no longer a fatal(ish) error.

\* Pod::Simple::BlackBox -- added experimental new VerbatimFormatted stuff.

2002-10-16 Sean M. Burke <sburke@cpan.org>

\* Release 0.94

\* Beta release. Much documentation still to write, many features still to add. The APIs might change in future versions.

\* Pod::Simple::RTF -- minor style tweaks

\* Pod::Simple::PullParserEndToken and ::PullParserStartToken -- added ->tag as an alias for ->tagname.

\* Pod::Simple and Pod::Simple::BlackBox

-- added tolerance for

"=item \* Foo" as a variant syntax for "=item \*\n\nFoo". Tests added/changed accordingly.

\* Pod::Simple::HTML -- added <a name="..."> stuff, and a hack at doing something with X<...>'s.

2002-09-29 Sean M. Burke <sburke@cpan.org>

\* Release 0.93

\* Beta release. Much documentation still to write, many features still to add. The APIs might change in future versions.

\* Pod::Simple -- added errors\_seen attribute

\* Pod::Simple::HTML -- added support for =for HTML ... directives, and =extend directives.

\* Oh, and I added Pod::Simple::RTF in 0.92 but forgot to note it until now.

2002-09-29 Sean M. Burke <sburke@cpan.org>

\* Release 0.92

\* Beta release. Much documentation still to write, many features still to add. The APIs might change in future versions.

\* Fixing bungled distribution.

2002-09-29 Sean M. Burke <sburke@cpan.org>

\* Release 0.91

\* Beta release. Much documentation still to write, many features

still to

add. The APIs might change in future versions.

\* Pod::Simple::PullParserTextToken -- added 'text\_r'

\* Pod::Simple::PullParser -- added 'get\_title' and  
'get\_title\_short' to

\* Pod::Simple -- corrected wording of "Format for second =extend  
parameter" error message.

\* Pod::PullParser -- made its filter() run as intended, like  
Pod::Simple's filter.

\* Pod::Subclassing -- more docs

2002-09-11 Sean M. Burke <sburke@cpan.org>

\* Release 0.90

\* Beta release. Much documentation still to write, many features  
still to add. The APIs might change in future versions.

=head1 NAME

Pod::Simple::HTMLBatch - convert several Pod files to several HTML files

=head1 SYNOPSIS

```
perl -MPod::Simple::HTMLBatch -e 'Pod::Simple::HTMLBatch::go' in out
```

=head1 DESCRIPTION

This module is used for running batch-conversions of a lot of HTML  
documents

This class is NOT a subclass of Pod::Simple::HTML  
(nor of bad old Pod::Html) -- although it uses  
Pod::Simple::HTML for doing the conversion of each document.

The normal use of this class is like so:

```
use Pod::Simple::HTMLBatch;  
my $batchconv = Pod::Simple::HTMLBatch->new;
```

```
$batchconv->some_option( some_value );
$batchconv->some_other_option( some_other_value );
$batchconv->batch_convert( \@search_dirs, $output_dir );
```

=head2 FROM THE COMMAND LINE

Note that this class also provides  
(but does not export) the function `Pod::Simple::HTMLBatch::go`.

This is basically just a shortcut for `C<<`

```
Pod::Simple::HTMLBatch->batch_convert(@ARGV) >>.
```

It's

meant to be handy for calling from the command line.

However, the shortcut requires that you specify exactly two command-line arguments, `C<indirs>` and `C<outdir>`.

Example:

```
% mkdir out_html
% perl -MPod::Simple::HTMLBatch -e Pod::Simple::HTMLBatch::go @INC out_html
  (to convert the pod from Perl's @INC
   files under the directory ./out_html)
```

(Note that the command line there contains a literal `atsign-I-N-C`. This is handled as a special case by `batch_convert`, in order to save you having to enter the odd-looking `""` as the first command-line parameter when you mean "just use whatever's in `@INC`".)

Example:

```
% mkdir ../seekrut
% chmod og-rx ../seekrut
% perl -MPod::Simple::HTMLBatch -e Pod::Simple::HTMLBatch::go . ../seekrut
  (to convert the pod under the current dir into HTML
   files under the directory ../seekrut)
```

Example:

```
% perl -MPod::Simple::HTMLBatch -e Pod::Simple::HTMLBatch::go happydocs .
  (to convert all pod from happydocs into the current
  directory)
```

=head1 MAIN METHODS

=over

```
=item $batchconv = Pod::Simple::HTMLBatch->new;
```

This TODO

```
=item $batchconv->batch_convert( I<indirs>, I<outdir> );
```

this TODO

```
=item $batchconv->batch_convert( undef , ...);
```

```
=item $batchconv->batch_convert( q{ @INC}, ...);
```

These two values for I<indirs> specify that the normal Perl @INC

```
=item $batchconv->batch_convert( \@dirs , ...);
```

This specifies that the input directories are the items in the arrayref C<\@dirs>.

```
=item $batchconv->batch_convert( "somedir" , ...);
```

This specifies that the director "somedir" is the input. (This can be an absolute or relative path, it doesn't matter.)

A common value you might want would be just "." for the current directory:

```
    $batchconv->batch_convert( ".", ...);
```

```
=item $batchconv->batch_convert( 'somedir:someother:also' , ...);
```

This specifies that you want the dirs "somedir", "someother", and "also" scanned, just as if you'd passed the arrayref C<[qw( somedir someother also)]>. Note that a ":"-separator is normal under Unix, but Under MSWin, you'll need C<'somedir;someother;also'> instead, since the pathsep on MSWin is ";" instead of ":". (And I<that> is because ":" often comes up in paths, like C<"c:/perl/lib">.)

(Exactly what separator character should be used, is gotten from C<\$Config::Config{'path\_sep'}>, via the L<Config> module.)

```
=item $batchconv->batch_convert( ... , undef );
```

This specifies that you want the HTML output to go into the current

directory.

(Note that a missing or undefined value means a different thing in the first slot than in the second. That's so that `C->batch_convert()` with no arguments (or undef arguments) means "go from @INC, into the current directory.")

```
=item $batchconv->batch_convert( ... , 'somedir' );
```

This specifies that you want the HTML output to go into the directory 'somedir'.

(This can be an absolute or relative path, it doesn't matter.)

```
=back
```

Note that you can also call `C->batch_convert` as a class method, like so:

```
Pod::Simple::HTMLBatch->batch_convert(
... );
```

That is just short for this:

```
Pod::Simple::HTMLBatch->new->batch_convert(...);
```

That is, it runs a conversion with default options, for whatever inputdirs and output dir you specify.

```
=head2 ACCESSOR METHODS
```

The following are all accessor methods -- that is, they don't do anything on their own, but just alter the contents of the conversion object, which comprises the options for this particular batch conversion.

We show the "put" form of the accessors below (i.e., the syntax you use for setting the accessor to a specific value). But you can also call each method with no parameters to get its current value. For example, `C->>$self->contents_file()` returns the current value of the `contents_file` attribute.

```
=over
```

```
=item $batchconv->verbose( I<nonnegative_integer> );
```

This controls how verbose to be during batch conversion, as far as

notes to STDOUT (or whatever is C<select>'d) about how the conversion is going. If 0, no progress information is printed.  
If 1 (the default value), some progress information is printed.  
Higher values print more information.

```
=item $batchconv->index( I<true-or-false> );
```

This controls whether or not each HTML page is liable to have a little table of contents at the top (which we call an "index" for historical reasons). This is true by default.

```
=item $batchconv->contents_file( I<filename> );
```

If set, should be the name of a file (in the output directory) to write the HTML index to. The default value is "index.html".  
If you set this to a false value, no contents file will be written.

```
=item $batchconv->contents_page_start( I<HTML_string> );
```

This specifies what string should be put at the beginning of the contents page.

The default is a string more or less like this:

```
<html>
<head><title>Perl Documentation</title></head>
<body class='contentspage'>
<h1>Perl Documentation</h1>
```

```
=item $batchconv->contents_page_end( I<HTML_string> );
```

This specifies what string should be put at the end of the contents page.

The default is a string more or less like this:

```
<p class='contentsfooty'>Generated by
Pod::Simple::HTMLBatch v3.01 under Perl v5.008
<br>At Fri May 14 22:26:42 2004 GMT,
which is Fri May 14 14:26:42 2004 local time.</p>
```

```
=item $batchconv->add_css( $url );
```

TODO

```
=item $batchconv->add_javascript( $url );
```

TODO

```
=item $batchconv->css_flurry( I<true-or-false> );
```

If true (the default value), we autogenerate some CSS files in the output directory, and set our HTML files to use those.

TODO: continue

```
=item $batchconv->javascript_flurry( I<true-or-false> );
```

If true (the default value), we autogenerate a JavaScript in the output directory, and set our HTML files to use it. Currently, the JavaScript is used only to get the browser to remember what stylesheet it prefers.

TODO: continue

```
=item $batchconv->no_contents_links( I<true-or-false> );
```

TODO

```
=item $batchconv->html_render_class( I<classname> );
```

This sets what class is used for rendering the files.

The

default is "Pod::Simple::HTML". If you set it to something else, it should probably be a subclass of Pod::Simple::HTML, and you should C<require> or C<use> that class so that's it's loaded before Pod::Simple::HTMLBatch tries loading it.

```
=item $batchconv->search_class( I<classname> );
```

This sets what class is used for searching for the files.

The default is "Pod::Simple::Search". If you set it to something else, it should probably be a subclass of Pod::Simple::Search, and you should C<require> or C<use> that class so that's it's loaded before Pod::Simple::HTMLBatch tries loading it.

```
=back
```

```
=head1 NOTES ON CUSTOMIZATION
```

TODO

call `add_css($someurl)` to add stylesheet as alternate  
call `add_css($someurl,1)` to add as primary stylesheet

call `add_javascript`

subclass `Pod::Simple::HTML` and set `$batchconv->html_render_class` to  
that classname  
and maybe override  
`$page->batch_mode_page_object_init($self, $module, $infile, $outfile, $depth)`  
or maybe override

`$batchconv->batch_mode_page_object_init($page, $module, $infile, $outfile, $depth)`  
subclass `Pod::Simple::Search` and set `$batchconv->search_class` to  
that classname

=head1 ASK ME!

If you want to do some kind of big pod-to-HTML version with some particular kind of option that you don't see how to achieve using this module, email me (C<[sburke@cpan.org](mailto:sburke@cpan.org)>) and I'll probably have a good idea how to do it. For reasons of concision and energetic laziness, some methods and options in this module (and the dozen modules it depends on) are undocumented; but one of those undocumented bits might be just what you're looking for.

=head1 NAME

Pod::Simple::PullParser -- a pull-parser interface to parsing Pod

=head1 SYNOPSIS

```
my $parser = SomePodProcessor->new;  
$parser->set_source( "whatever.pod" );  
$parser->run;
```

Or:

```
my $parser = SomePodProcessor->new;  
$parser->set_source( $some_filehandle_object );
```

```
$parser->run;
```

Or:

```
my $parser = SomePodProcessor->new;  
$parser->set_source( \ $document_source );  
$parser->run;
```

Or:

```
my $parser = SomePodProcessor->new;  
$parser->set_source( \@document_lines );  
$parser->run;
```

And elsewhere:

```
require 5;  
package SomePodProcessor;  
use strict;  
use base qw(Pod::Simple::PullParser);  
  
sub run {  
    my $self = shift;  
    Token:  
    while(my $token = $self->get_token) {  
        ...process each token...  
    }  
}
```

=head1 DESCRIPTION

This class is for using Pod::Simple to build a Pod processor -- but one that uses an interface based on a stream of token objects, instead of based on events.

This is a subclass of L<Pod::Simple>  
and inherits all its methods.

A subclass of Pod::Simple::PullParser should define a C<run> method that calls C<< \$token = \$parser->get\_token >> to pull tokens.

See the source for Pod::Simple::RTF for an example of a formatter that uses Pod::Simple::PullParser.

=head1 METHODS

=over

=item my \$token = \$parser->get\_token

This returns the next token object (which will be of a subclass of L<Pod::Simple::PullParserToken>), or undef if the parser-stream has hit the end of the document.

=item \$parser->unget\_token( \$token )

=item \$parser->unget\_token( \$token1, \$token2, ... )

This restores the token object(s) to the front of the parser stream.

=back

The source has to be set before you can parse anything. The lowest-level way is to call C<set\_source>:

=over

=item \$parser->set\_source( \$filename )

=item \$parser->set\_source( \$filehandle\_object )

=item \$parser->set\_source( \document\_source )

=item \$parser->set\_source( \@document\_lines )

=back

Or you can call these methods,  
which Pod::Simple::PullParser has defined  
to work just like Pod::Simple's same-named methods:

=over

=item \$parser->parse\_file(...)

=item \$parser->parse\_string\_document(...)

=item \$parser->filter(...)

=item \$parser->parse\_from\_file(...)

=back

For those to work, the Pod-processing subclass of Pod::Simple::PullParser has to have defined a \$parser->run method -- so it is advised that all Pod::Simple::PullParser subclasses do so.

See the Synopsis above, or the source for Pod::Simple::RTF.

Authors of formatter subclasses might find these methods useful to call on a parser object that you haven't started pulling tokens from yet:

```
=over
```

```
=item my $title_string = $parser->get_title
```

This tries to get the title string out of \$parser, by getting some tokens, and scanning them for the title, and then ungetting them so that you can process the token-stream from the beginning.

For example, suppose you have a document that starts out:

```
=head1 NAME
```

```
Hoo::Boy::Wowza -- Stuff B<wow> yeah!
```

\$parser->get\_title on that document will return "Hoo::Boy::Wowza -- Stuff wow yeah!". If the document starts with:

```
=head1 Name
```

```
Hoo::Boy::W00t -- Stuff B<w00t> yeah!
```

Then you'll need to pass the C<nocase> option in order to recognize "Name":

```
$parser->get_title(nocase => 1);
```

In cases where get\_title can't find the title, it will return empty-string ("").

```
=item my $title_string = $parser->get_short_title
```

This is just like get\_title, except that it returns just the modulename, if the title seems to be of the form "SomeModuleName -- description".

For example, suppose you have a document that starts out:

```
=head1 NAME
```

```
Hoo::Boy::Wowza -- Stuff B<wow> yeah!
```

then \$parser->get\_short\_title on that document will return "Hoo::Boy::Wowza".

But if the document starts out:

```
=head1 NAME
```

Hooboy, stuff B<wow> yeah!

then `$parser->get_short_title` on that document will return "Hooboy, stuff wow yeah!". If the document starts with:

```
=head1 Name
```

```
Hoo::Boy::W00t -- Stuff B<w00t>
yeah!
```

Then you'll need to pass the `C<nocase>` option in order to recognize "Name":

```
$parser->get_short_title(nocase => 1);
```

If the title can't be found, then `get_short_title` returns empty-string ("").

```
=item $author_name = $parser->get_author
```

This works like `get_title` except that it returns the contents of the "`=head1 AUTHOR\n\nParagraph...\n`" section, assuming that that section isn't terribly long. To recognize a "`=head1 Author\n\nParagraph\n`" section, pass the `C<nocase>` option:

```
$parser->get_author(nocase => 1);
```

(This method tolerates "AUTHORS" instead of "AUTHOR" too.)

```
=item $description_name = $parser->get_description
```

This works like `get_title` except that it returns the contents of the "`=head1 DESCRIPTION\n\nParagraph...\n`" section, assuming that that section isn't terribly long. To recognize a "`=head1 Description\n\nParagraph\n`" section, pass the `C<nocase>` option:

```
$parser->get_description(nocase => 1);
```

```
=item $version_block = $parser->get_version
```

This works like

`get_title` except that it returns the contents of the "`=head1 VERSION\n\n[BIG BLOCK]\n`" block. Note that this does NOT return the module's `C<$VERSION>!!` To recognize a

"=head1 Version\n\n[BIG BLOCK]\n" section, pass the C<nocase> option:

```
$parser->get_version(nocase => 1);
```

=back

=head1 NOTE

You don't actually I<have> to define a C<run> method. If you're writing a Pod-formatter class, you should define a C<run> just so that users can call C<parse\_file> etc, but you don't I<have> to.

And if you're not writing a formatter class, but are instead just writing a program that does something simple with a Pod::PullParser object (and not an object of a subclass), then there's no reason to bother subclassing to add a C<run> method.

=head1 NAME

Pod::Simple::HTML - convert Pod to HTML

=head1 SYNOPSIS

```
perl -MPod::Simple::HTML -e Pod::Simple::HTML::go thingy.pod
```

=head1 DESCRIPTION

This class is for making an HTML rendering of a Pod document.

This is a subclass of L<Pod::Simple::PullParser> and inherits all its methods (and options).

Note that if you want to do a batch conversion of a lot of Pod documents to HTML, you should see the module L<Pod::Simple::HTMLBatch>.

=head1 CALLING FROM THE COMMAND LINE

TODO

```
perl -MPod::Simple::HTML -e Pod::Simple::HTML::go Thing.pod Thing.html
```

=head1 CALLING FROM PERL

=head2 Minimal code

```
use Pod::Simple::HTML;  
my $p = Pod::Simple::HTML->new;  
$p->output_string(\my $html);  
$p->parse_file('path/to/Module/Name.pm');  
open my $out, '>', 'out.html' or die "Cannot open 'out.html': $!\n";  
print $out $html;
```

=head2 More detailed example

```
use Pod::Simple::HTML;
```

Set the content type:

```
$Pod::Simple::HTML::Content_decl  
= q{<meta http-equiv="Content-Type" content="text/html; charset=UTF-8" >};
```

```
my $p = Pod::Simple::HTML->new;
```

Include a single javascript source:

```
$p->html_javascript('http://abc.com/a.js');
```

Or insert multiple javascript source in the header  
(or for that matter include anything, though this is not recommended)

```
$p->html_javascript(  
  <script type="text/javascript" src="http://abc.com/b.js"></script>  
  <script type="text/javascript" src="http://abc.com/c.js"></script>');
```

Include a single css source in the header:

```
$p->html_css('/style.css');
```

or insert multiple css sources:

```
$p->html_css(  
  <link rel="stylesheet" type="text/css" title="pod_stylesheet" href="http://remote.server.com/jquery.css">  
  <link rel="stylesheet" type="text/css" title="pod_stylesheet" href="/style.css">);
```

Tell the parser where should the output go. In this case it will be placed in the \$html variable:

```
my $html;  
$p->output_string(\$html);
```

Parse and  
process a file with pod in it:

```
$p->parse_file('path/to/Module/Name.pm');
```

=head1 METHODS

TODO

all (most?) accessorized methods

The following variables need to be set B<before> the call to the ->new constructor.

Set the string that is included before the opening <html> tag:

```
$Pod::Simple::HTML::Doctype_decl = qq{<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01  
Transitional//EN"  
"http://www.w3.org/TR/html4/loose.dtd">\n};
```

Set the content-type in the HTML head: (defaults to ISO-8859-1)

```
$Pod::Simple::HTML::Content_decl = q{<meta http-equiv="Content-Type" content="text/html; charset=UTF-8"  
>};
```

Set the value that will be ebedded in the opening tags of F, C tags and verbatim text.

F maps to <em>, C maps to <code>, Verbatim text maps to <pre> (Computerese defaults to "")

```
$Pod::Simple::HTML::Computerese = ' class="some_class_name";
```

```
=head2 html_css
```

```
=head2 html_javascript
```

```
=head2 title_prefix
```

```
=head2 title_postfix
```

```
=head2 html_header_before_title
```

This includes everything before

the <title> opening tag including the Document type

and including the opening <title> tag. The following call will set it to be a simple HTML file:

```
$p->html_header_before_title('<html><head><title>');
```

```
=head2 html_h_level
```

Normally =head1 will become <h1>, =head2 will become <h2> etc.

Using the html\_h\_level method will change these levels setting the h level of =head1 tags:

```
$p->html_h_level(3);
```

Will make sure that =head1 will become <h3> and =head2 will become <h4> etc...

```
=head2 index
```

Set it to some true value if you want to have an index (in reality a table of contents) to be added at the top of the generated HTML.

```
$p->index(1);
```

```
=head2 html_header_after_title
```

Includes the closing tag of </title> and through the rest of the head till the opening of the body

```
$p->html_header_after_title('</title>...</head><body id="my_id">');
```

```
=head2 html_footer
```

The very end of the document:

```
$p->html_footer( qq[\n<!-- end doc -->\n\n</body></html>\n] );
```

```
=head1 SUBCLASSING
```

Can

use any of the methods described above but for further customization one needs to override some of the methods:

```
package My::Pod;
```

```
use strict;
```

```
use warnings;
```

```
use base 'Pod::Simple::HTML';
```

```
# needs to return a URL string such
```

```
# http://some.other.com/page.html
```

```
# #anchor_in_the_same_file
```

```
# /internal/ref.html
```

```
sub do_pod_link {
```

```
    # My::Pod object and Pod::Simple::PullParserStartToken object
```

```
    my ($self, $link) = @_;
```

```
    say $link->tagname;      # will be L for links
```

```
    say $link->attr('to');   #
```

```
    say $link->attr('type'); # will be 'pod' always
```

```
    say $link->attr('section');
```

```
# Links local to our web site
```

```
if ($link->tagname eq 'L' and $link->attr('type') eq 'pod') {
```

```
    my $to = $link->attr('to');
```

```
    if ($to =~ /^Padre::/) {
```

```
        $to =~ s{::}{/}g;
```

```
        return "/docs/Padre/$to.html";
```

```
    }
```

```
}

# all other links are generated by the parent class
my $ret = $self->SUPER::do_pod_link($link);
return $ret;
}

1;
```

Meanwhile  
in script.pl:

```
use My::Pod;

my $p = My::Pod->new;

my $html;
$p->output_string(\$html);
$p->parse_file('path/to/Module/Name.pm');
open my $out, '>', 'out.html' or die;
print $out $html;
```

=head1 NAME

Pod::Simple::RTF -- format Pod as RTF

=head1 SYNOPSIS

perl -MPod::Simple::RTF -e \

```
"exit Pod::Simple::RTF->filter(shift)->any_errata_seen" \  
thingy.pod > thingy.rtf
```

## =head1 DESCRIPTION

This class is a formatter that takes Pod and renders it as RTF, good for viewing/printing in MSWord, WordPad/write.exe, TextEdit, etc.

This is a subclass of L<Pod::Simple> and inherits all its methods.

## =head1 FORMAT CONTROL ATTRIBUTES

You can set these attributes on the parser object before you call C<parse\_file> (or a similar method) on it:

=over

```
=item $parser->head1_halfpoint_size( I<halfpoint_integer> );
```

```
=item $parser->head2_halfpoint_size( I<halfpoint_integer> );
```

```
=item $parser->head3_halfpoint_size( I<halfpoint_integer> );
```

```
=item $parser->head4_halfpoint_size( I<halfpoint_integer> );
```

These methods set the size (in half-points, like 52 for 26-point) that these heading levels will appear as.

```
=item $parser->codeblock_halfpoint_size(  
I<halfpoint_integer> );
```

This method sets the size (in half-points, like 21 for 10.5-point) that codeblocks ("verbatim sections") will appear as.

```
=item $parser->header_halfpoint_size( I<halfpoint_integer> );
```

This method sets the size (in half-points, like 15 for 7.5-point) that the header on each page will appear in. The header is usually just "I<modulename> p. I<pagenumber>".

```
=item $parser->normal_halfpoint_size( I<halfpoint_integer> );
```

This method sets the size (in half-points, like 26 for 13-point) that normal paragraphic text will appear in.

```
=item $parser->no_proofing_exemptions( I<true_or_false> );
```

Set this value to true if you don't want the formatter to try

putting a hidden code on all Perl symbols (as best as it can notice them) that labels them as being not in English, and so not worth spellchecking.

```
=item $parser->doc_lang( I<microsoft_decimal_language_code> )
```

This sets the language code to tag this document as being in. By default, it is currently the value of the environment variable C<RTFDEFLANG>, or if that's not set, then the value 1033 (for US English).

Setting this appropriately is useful if you want to use the RTF to spellcheck, and/or if you want it to hyphenate right.

Here are some notable values:

- 1033 US English
- 2057 UK English
- 3081 Australia English
- 4105 Canada English
- 1034 Spain Spanish
- 2058 Mexico Spanish
- 1031 Germany German
- 1036 France French
- 3084 Canada French
- 1035 Finnish
- 1044 Norwegian (Bokmal)
- 2068 Norwegian (Nynorsk)

```
=back
```

If you are particularly interested in customizing this module's output even more, see the source and/or write to me.

NAME

HTTP::Negotiate - choose a variant to serve

SYNOPSIS

```
use HTTP::Negotiate qw(choose);
```

```
# ID   QS   Content-Type  Encoding Char-Set   Lang  Size
$variants =
  [['var1', 1.000, 'text/html', undef, 'iso-8859-1', 'en', 3000],
   ['var2', 0.950, 'text/plain', 'gzip', 'us-ascii', 'no', 400],
   ['var3', 0.3, 'image/gif', undef, undef, undef, 43555],
  ];
```

```
@preferred = choose($variants, $request_headers);
```

```
$the_one = choose($variants);
```

DESCRIPTION

This module provides a complete implementation of the HTTP content negotiation algorithm specified in draft-ietf-http-v11-spec-00.ps chapter 12. Content negotiation allows for the selection of a preferred content representation based upon attributes of the negotiable variants and the value of the various `Accept*` header fields in the request.

The variants are ordered by preference by calling the function `choose()`.

The first parameter is reference to an array of the variants to choose among. Each element in this array is an array with the values [`$id`, `$qs`, `$content_type`, `$content_encoding`, `$charset`, `$content_language`, `$content_length`] whose meanings are described below. The `$content_encoding` and `$content_language` can be either a single scalar

value or an array reference if there are several values.

The second optional parameter is either a `HTTP::Headers` or a `HTTP::Request` object which is searched for "Accept\*" headers. If this parameter is missing, then the accept specification is initialized from the CGI environment variables `HTTP_ACCEPT`, `HTTP_ACCEPT_CHARSET`, `HTTP_ACCEPT_ENCODING` and `HTTP_ACCEPT_LANGUAGE`.

In an array context, `choose()` returns a list of [variant identifier, calculated quality, size] tuples. The values are sorted by quality, highest quality first. If the calculated quality is the same for two variants, then they are sorted by size (smallest first). \*E.g.\*:

```
(['var1', 1, 2000], ['var2', 0.3, 512], ['var3', 0.3, 1024]);
```

Note that also zero quality variants are included in the return list even if these should never be served to the client.

In a scalar context, it returns the identifier of the variant with the highest score or ``undef`` if none have non-zero quality.

If the `$HTTP::Negotiate::DEBUG` variable is set to `TRUE`, then a lot of noise is generated on `STDOUT` during evaluation of `choose()`.

## VARIANTS

A variant is described by a list of the following values. If the attribute does not make sense or is unknown for a variant, then use ``undef`` instead.

identifier

This is a string that you use as the name for the variant. This identifier for the preferred variants returned by `choose()`.

qs This is a number between 0.000 and 1.000 that describes the "source quality". This is what `draft-ietf-http-v11-spec-00.ps` says about this value:

Source quality is measured by the content provider as representing the amount of degradation from the original source. For example, a picture in JPEG form would have a lower qs when translated to the XBM format, and much lower qs when translated to an ASCII-art representation. Note, however, that this is a function of the source - an original piece of ASCII-art may degrade in quality if it is captured in JPEG form. The qs values should be assigned to each variant by the content provider; if no qs value has been assigned, the default is generally "qs=1".

#### content-type

This is the media type of the variant. The media type does not include a charset attribute, but might contain other parameters.

Examples are:

```
text/html
text/html;version=2.0
text/plain
image/gif
image/jpg
```

#### content-encoding

This is one or more content encodings that has been applied to the variant. The content encoding is generally used as a modifier to the content media type. The most common content encodings are:

```
gzip
compress
```

#### content-charset

This is the character set used when the variant contains text. The charset value should generally be `undef` or one of these:

```
us-ascii
iso-8859-1 ... iso-8859-9
iso-2022-jp
iso-2022-jp-2
iso-2022-kr
unicode-1-1
unicode-1-1-utf-7
unicode-1-1-utf-8
```

#### content-language

This describes one or more languages that are used in the variant. Language is described like this in draft-ietf-http-v11-spec-00.ps: A language is in this context a natural language spoken, written, or otherwise conveyed by human beings for communication of information to other human beings. Computer languages are explicitly excluded.

The language tags are defined by RFC 3066. Examples are:

```
no      Norwegian
en      International English
en-US   US English
en-cockney
```

#### content-length

This is the number of bytes used to represent the content.

## ACCEPT HEADERS

The following Accept\* headers can be used for describing content preferences in a request (This description is an edited extract from draft-ietf-http-v11-spec-00.ps):

### Accept

This header can be used to indicate a list of media ranges which are acceptable as a response to the request. The "\*" character is used to group media types into ranges, with "\*/\*" indicating all media types and "type/\*" indicating all subtypes of that type.

The parameter q is used to indicate the quality factor, which represents the user's preference for that range of media types. The parameter mbx gives the maximum acceptable size of the response content. The default values are: q=1 and mbx=infinity. If no Accept header is present, then the client accepts all media types with q=1.

For example:

```
Accept: audio/*;q=0.2;mbx=200000, audio/basic
```

would mean: "I prefer audio/basic (of any size), but send me any audio type if it is the best available after an 80% mark-down in quality and its size is less than 200000 bytes"

### Accept-Charset

Used to indicate what character sets are acceptable for the response. The "us-ascii" character set is assumed to be acceptable for all user agents. If no Accept-Charset field is given, the default is that any charset is acceptable. Example:

```
Accept-Charset: iso-8859-1, unicode-1-1
```

### Accept-Encoding

Restricts the Content-Encoding values which are acceptable in the response. If no Accept-Encoding field is present, the server may assume that the client will accept any content encoding. An empty

Accept-Encoding means that no content encoding is acceptable.

Example:

```
Accept-Encoding: compress, gzip
```

### Accept-Language

This field is similar to Accept, but restricts the set of natural languages that are preferred in a response. Each language may be

given an associated quality value which represents an estimate of the user's comprehension of that language. For example:

```
Accept-Language: no, en-gb;q=0.8, de;q=0.55
```

would mean: "I prefer Norwegian, but will accept British English (with 80% comprehension) or German (with 55% comprehension).

=head1 DESCRIPTION

This module provides a complete implementation of the HTTP content negotiation algorithm specified in F<draft-ietf-http-v11-spec-00.ps> chapter 12. Content negotiation allows for the selection of a preferred content representation based upon attributes of the negotiable variants and the value of the various Accept\* header fields in the request.

The variants are ordered by preference by calling the function `choose()`.

The first parameter is reference to an array of the variants to choose among.

Each element in this array is an array with the values [`$id`, `$qs`, `$content_type`, `$content_encoding`, `$charset`, `$content_language`, `$content_length`] whose meanings are described below. The `$content_encoding` and `$content_language` can be either a single scalar value or an array reference if there are several values.

The second optional parameter is either a `HTTP::Headers` or a `HTTP::Request` object which is searched for "Accept\*" headers. If this parameter is missing, then the accept specification is initialized from the CGI environment variables `HTTP_ACCEPT`, `HTTP_ACCEPT_CHARSET`, `HTTP_ACCEPT_ENCODING` and `HTTP_ACCEPT_LANGUAGE`.

In an array context, `choose()` returns a list of [variant identifier, calculated quality, size] tuples. The values are sorted by quality, highest quality first. If the calculated quality is the same for two variants, then they are sorted by size (smallest first). I<E.g.>:

```
(['var1', 1, 2000], ['var2', 0.3, 512], ['var3', 0.3, 1024]);
```

Note that also zero quality variants are included in the return list even if these should never be served to the client.

In a scalar context, it returns the identifier of the variant with the highest score or `C<undef>` if none have non-zero quality.

If the `$HTTP::Negotiate::DEBUG` variable is set to `TRUE`, then a lot of noise is generated on `STDOUT` during evaluation of `choose()`.

=head1 VARIANTS

A variant is described by a list of the following values. If the attribute does not make sense or is unknown for a variant, then use `C<undef>` instead.

=over 3

=item identifier

This is a string that you use as the name for the variant. This identifier for the preferred variants returned by `choose()`.

=item qs

This is a number between 0.000 and 1.000 that describes the "source quality". This is what F<draft-ietf-http-v11-spec-00.ps> says about this value:

Source quality is measured by the content provider as representing the amount of degradation from the original source. For example, a picture in JPEG form would have a lower qs when translated to the XBM format, and much lower qs when translated to an ASCII-art representation. Note, however, that this is a function of the source - an original piece of ASCII-art may degrade in quality if it is captured in JPEG form. The qs values should be assigned to each variant by the content provider; if no qs value has been assigned, the default is generally "qs=1".

=item content-type

This is the media type of the variant. The media type does not include a charset attribute, but might contain other parameters. Examples are:

text/html  
text/html;version=2.0  
text/plain  
image/gif  
image/jpg

=item content-encoding

This is one or more content encodings that has been applied to the variant. The content encoding is generally used as a modifier to the content media type. The most common content encodings are:

gzip  
compress

=item content-charset

This is the character set used when the variant contains text. The charset value should generally be C<undef> or one of these:

us-ascii  
iso-8859-1 ... iso-8859-9  
iso-2022-jp  
iso-2022-jp-2

iso-2022-kr  
unicode-1-1  
unicode-1-1-utf-7  
unicode-1-1-utf-8

=item content-language

This describes one or more languages that are used in the variant. Language is described like this in F<draft-ietf-http-v11-spec-00.ps>: A language is in this context a natural language spoken, written, or otherwise conveyed by human beings for communication of information to other human beings. Computer languages are explicitly excluded.

The language tags are defined by RFC 3066. Examples are:

no        Norwegian  
en        International English  
en-US     US English  
en-cockney

=item content-length

This is the number of bytes used to represent the content.

=back

=head1 ACCEPT HEADERS

The following Accept\* headers can be used for describing content preferences in a request (This description is an edited extract from F<draft-ietf-http-v11-spec-00.ps>):

=over 3

=item Accept

This header can be used to indicate a list of media ranges which are acceptable as a response to the request. The "\*" character is used to group media types into ranges, with "\*/\*" indicating all media types and "type/\*" indicating all subtypes of that type.

The parameter q is used to indicate the quality factor, which represents the user's preference for that range of media types. The parameter mbx gives the maximum acceptable size of the response content. The default values are: q=1 and mbx=infinity. If no Accept header is present, then the client accepts all media types with q=1.

For example:

Accept: audio/\*;q=0.2;mbx=200000, audio/basic

would mean: "I prefer audio/basic (of any size), but send me any audio type if it is the best available after an 80% mark-down in quality and its size is less than 200000 bytes"

=item Accept-Charset

Used to indicate what character

sets are acceptable for the response.

The "us-ascii" character set is assumed to be acceptable for all user agents. If no Accept-Charset field is given, the default is that any charset is acceptable. Example:

Accept-Charset: iso-8859-1, unicode-1-1

=item Accept-Encoding

Restricts the Content-Encoding values which are acceptable in the response. If no Accept-Encoding field is present, the server may assume that the client will accept any content encoding. An empty Accept-Encoding means that no content encoding is acceptable. Example:

Accept-Encoding: compress, gzip

=item Accept-Language

This field is similar to Accept, but restricts the set of natural languages that are preferred in a response. Each language may be given an associated quality value which represents an estimate of the user's comprehension of that language. For example:

Accept-Language: no, en-gb;q=0.8, de;q=0.55

would mean: "I prefer Norwegian, but will accept British English (with 80% comprehension)  
or German (with 55% comprehension).

=head1 NAME

IO::Uncompress::Unzip - Read zip files/buffers

=head1 SYNOPSIS

```
use IO::Uncompress::Unzip qw(unzip $UnzipError) ;
```

```
my $status = unzip $input => $output [,OPTS]  
    or die "unzip failed: $UnzipError\n";
```

```
my $z = new IO::Uncompress::Unzip $input [OPTS]  
    or die "unzip failed: $UnzipError\n";
```

```
$status = $z->read($buffer)  
$status = $z->read($buffer, $length)  
$status = $z->read($buffer, $length, $offset)  
$line = $z->getline()  
$char = $z->getc()  
$char = $z->ungetc()  
$char = $z->opened()
```

```
$status = $z->inflateSync()
```

```
$data = $z->trailingData()
```

```
$status = $z->nextStream()
$data = $z->getHeaderInfo()
$z->tell()
$z->seek($position, $whence)
$z->binmode()
$z->fileno()
$z->eof()
$z->close()
```

```
$UnzipError ;
```

```
# IO::File mode
```

```
<$z>
read($z, $buffer);
read($z, $buffer, $length);
read($z, $buffer, $length, $offset);
tell($z)
seek($z, $position, $whence)
binmode($z)
fileno($z)
eof($z)
close($z)
```

```
=head1 DESCRIPTION
```

This module provides a Perl interface that allows the reading of zlib files/buffers.

For writing zip files/buffers, see the companion module `IO::Compress::Zip`.

```
=head1 Functional Interface
```

A top-level function, `C<unzip>`, is provided to carry out "one-shot" uncompression between buffers and/or files. For finer control over the uncompression process, see the [L<"/OO Interface">](#) section.

```
use IO::Uncompress::Unzip qw(unzip $UnzipError) ;

unzip $input_filename_or_reference => $output_filename_or_reference [,OPTS]
    or die "unzip failed: $UnzipError\n";
```

The functional interface needs Perl5.005 or better.

```
=head2 unzip $input_filename_or_reference => $output_filename_or_reference [, OPTS]
```

`C<unzip>` expects at least two parameters,

C<\$input\_filename\_or\_reference> and C<\$output\_filename\_or\_reference>.

=head3 The C<\$input\_filename\_or\_reference> parameter

The

parameter, C<\$input\_filename\_or\_reference>, is used to define the source of the compressed data.

It can take one of the following forms:

=over 5

=item A filename

If the <\$input\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for reading and the input data will be read from it.

=item A filehandle

If the C<\$input\_filename\_or\_reference> parameter is a filehandle, the input data will be read from it. The string '-' can be used as an alias for standard input.

=item A scalar reference

If C<\$input\_filename\_or\_reference> is a scalar reference, the input data will be read from C<\$\$input\_filename\_or\_reference>.

=item An array reference

If C<\$input\_filename\_or\_reference> is an array reference, each element in the array must be a filename.

The input data will be read from each file in turn.

The complete array will be walked to ensure that it only contains valid filenames before any data is uncompressed.

=item

An Input FileGlob string

If C<\$input\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<unzip> will assume that it is an I<input fileglob string>. The input is the list of files that match the fileglob.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$input\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head3 The C<\$output\_filename\_or\_reference> parameter

The parameter C<\$output\_filename\_or\_reference> is used to control the destination of the uncompressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the uncompressed data will be written to it.

=item A filehandle

If the C<\$output\_filename\_or\_reference> parameter is a filehandle, the uncompressed data will be written to it. The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output\_filename\_or\_reference> is a scalar reference, the uncompressed data will be stored in C<\$\$output\_filename\_or\_reference>.

=item An Array Reference

If C<\$output\_filename\_or\_reference> is an array reference, the uncompressed data will be pushed onto the array.

=item An Output FileGlob

If C<\$output\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<unzip> will assume that it is an I<output fileglob string>. The output is the list of files that match the fileglob.

When C<\$output\_filename\_or\_reference> is an fileglob string, C<\$input\_filename\_or\_reference> must also be a fileglob string. Anything else is an error.

See [L<File::GlobMapper|File::GlobMapper>](#) for more details.

=back

If the `C<$output_filename_or_reference>` parameter is any other type, `C<undef>` will be returned.

=head2 Notes

When `C<$input_filename_or_reference>` maps to multiple compressed files/buffers and `C<$output_filename_or_reference>` is a single file/buffer, after uncompression `C<$output_filename_or_reference>` will contain a concatenation of all the uncompressed data from each of the input files/buffers.

=head2 Optional Parameters

Unless specified below, the optional parameters for `C<unzip>`, `C<OPTS>`, are the same as those used with the OO interface defined in the [L<"/"Constructor Options">](#) section below.

=over 5

=item C<< AutoClose => 0|1 >>

This option applies to any input or output data streams to `C<unzip>` that are filehandles.

If `C<AutoClose>` is specified, and the value is true, it will result in all input and/or output filehandles being closed once `C<unzip>` has completed.

This parameter defaults to 0.

=item C<< BinModeOut => 0|1 >>

When writing to a file or filehandle, set `C<binmode>` before writing to the file.

Defaults to 0.

=item C<< Append => 0|1 >>

The behaviour of this option is dependent on the type of output data stream.

=over 5

=item \* A Buffer

If C<Append> is enabled, all uncompressed data will be append to the end of the output buffer. Otherwise the output buffer will be cleared before any uncompressed data is written to it.

=item \* A Filename

If C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any uncompressed data is written to it.

=item \* A Filehandle

If C<Append> is enabled, the filehandle will be positioned to the end of the file via a call to C<seek> before any uncompressed data is written to it. Otherwise the file pointer will not be moved.

=back

When C<Append> is specified, and set to true, it will I<append> all uncompressed data to the output data stream.

So when the output is a filehandle it will carry out a seek to the eof before writing any uncompressed data. If the output is a filename, it will be opened for appending. If the output is a buffer, all uncompressed data will be appended to the existing buffer.

Conversely when C<Append> is not specified, or it is present and is set to false, it will operate as follows.

When the output is a filename, it will truncate the contents of the file before writing any uncompressed data. If the output is a filehandle its position will not be changed. If the output is a buffer, it will be wiped before any uncompressed data is output.

Defaults to 0.

=item C<< MultiStream => 0|1 >>

If the input file/buffer contains multiple compressed data streams, this option will uncompress the whole lot as a single data stream.

Defaults to 0.

=item C<< TrailingData => \$scalar >>

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete.

This option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, C<trailingData> will return everything from the end of the compressed data stream to the end of the buffer.

If

the input is a filehandle, C<trailingData> will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using C<trailingData> if the input is a filename.

If you know the length of the compressed data stream before you start uncompressing, you can avoid having to use C<trailingData> by setting the C<InputLength> option.

=back

=head2 Examples

Say you have a zip file, C<file1.zip>, that only contains a single member, you can read it and write the uncompressed data to the file C<file1.txt> like this.

```
use strict ;
use warnings ;
use IO::Uncompress::Unzip qw(unzip $UnzipError) ;
```

```
my $input = "file1.zip";
my $output = "file1.txt";
unzip $input => $output
  or die "unzip failed: $UnzipError\n";
```

If you have a zip file that contains multiple members and want to read a specific member from the file, say C<"data1">, use the C<Name> option

```
use strict ;
use warnings ;
use IO::Uncompress::Unzip qw(unzip $UnzipError) ;
```

```

my $input = "file1.zip";
my $output = "file1.txt";
unzip $input => $output, Name => "data1"
    or die "unzip failed: $UnzipError\n";

```

Alternatively, if you want to read the C<"data1"> member into memory, use a scalar reference for the C<output> partameter.

```

use strict ;
use warnings ;
use IO::Uncompress::Unzip qw(unzip $UnzipError) ;

my $input = "file1.zip";
my $output ;
unzip $input => \$output, Name => "data1"
    or die "unzip failed: $UnzipError\n";
# $output now contains the uncompressed data

```

To read from an existing Perl filehandle, C<\$input>, and write the uncompressed data to a buffer, C<\$buffer>.

```

use strict ;
use warnings ;
use IO::Uncompress::Unzip qw(unzip $UnzipError) ;
use IO::File ;

my $input = new IO::File "<file1.zip"
    or die "Cannot open 'file1.zip': $!\n" ;
my $buffer ;
unzip $input => \$buffer
    or die "unzip failed: $UnzipError\n";

```

=head1 OO Interface

=head2 Constructor

The format of the constructor for IO::Uncompress::Unzip is shown below

```

my $z = new IO::Uncompress::Unzip $input [OPTS]
    or die "IO::Uncompress::Unzip failed: $UnzipError\n";

```

Returns an C<IO::Uncompress::Unzip> object on success and undef on failure. The variable C<\$UnzipError> will contain an error message on failure.

If you are running Perl 5.005 or better the object, C<\$z>, returned from IO::Uncompress::Unzip can be used exactly like an L<IO::File|IO::File> filehandle. This means that all normal input file operations can be carried out with

C<\$z>. For example, to read a line from a compressed file/buffer you can use either of these forms

```
$line = $z->getline();  
$line = <$z>;
```

The mandatory parameter C<\$input> is used to determine the source of the compressed data. This parameter can take one of three forms.

=over 5

=item A filename

If the C<\$input> parameter is a scalar, it is assumed to be a filename. This file will be opened for reading and the compressed data will be read from it.

=item A filehandle

If the C<\$input> parameter is a filehandle, the compressed data will be read from it.

The string '-' can be used as an alias for standard input.

=item A scalar reference

If C<\$input> is a scalar reference, the compressed data will be read from C<\$\$input>.

=back

=head2 Constructor Options

The option names defined below are case insensitive and can be optionally prefixed by a '-'. So all of the following are valid

```
-AutoClose  
-autoclose  
AUTOCLOSE  
autoclose
```

OPTS is a combination of the following options:

=over 5

=item C<< Name => "membername" >>

Open "membername" from the zip file for reading.

=item C<< AutoClose => 0|1 >>

This option is only valid when the C<\$input> parameter is a filehandle. If specified, and the value is true, it will result in the file being closed once either the C<close> method is called or the IO::Uncompress::Unzip object is destroyed.

This parameter defaults to 0.

=item C<< MultiStream => 0|1 >>

Treats the complete zip file/buffer as a single compressed data stream. When reading in multi-stream mode each member of the zip file/buffer will be uncompressed in turn until the end of the file/buffer is encountered.

This parameter defaults to 0.

=item C<< Prime => \$string >>

This option will uncompress the contents of C<\$string> before processing the input file/buffer.

This option can be useful when the compressed data is embedded in another file/data structure and it is not possible to work out where the compressed data begins without having to read the first few bytes. If this is the case, the uncompression can be I<primed> with these bytes using this option.

=item C<< Transparent => 0|1 >>

If this option is set and the input file/buffer is not compressed data, the module will allow reading of it anyway.

In addition, if the input file/buffer does contain compressed data and there is non-compressed data immediately following it, setting this option will make this module treat the whole file/buffer as a single data stream.

This option defaults to 1.

=item C<< BlockSize => \$num >>

When reading the compressed input data, IO::Uncompress::Unzip will read it in blocks of C<\$num> bytes.

This option defaults to 4096.

=item C<< InputLength => \$size >>

When present this option will limit the number of compressed bytes read from the input file/buffer to C<\$size>. This option can be used in the situation where there is useful data directly after the compressed data stream and you know beforehand the exact length of the compressed data stream.

This option is mostly used when reading from a filehandle, in which case the file pointer will be left pointing to the first byte directly after the compressed data stream.

This option defaults to off.

=item C<< Append => 0|1 >>

This option controls what the C<read> method does with uncompressed data.

If set to 1, all uncompressed data will be appended to the output parameter of the C<read> method.

If set to 0, the contents of the output parameter of the C<read> method will be overwritten by the uncompressed data.

Defaults to 0.

=item C<< Strict => 0|1 >>

This option controls whether the extra checks defined below are used when carrying out the decompression. When Strict is on, the extra tests are carried out, when Strict is off they are not.

The default for this option is off.

=back

=head2 Examples

TODO

=head1 Methods

=head2 read

Usage is

```
$status = $z->read($buffer)
```

Reads a block of compressed data (the size the the compressed block is determined by the C<Buffer> option in the constructor), uncompresses it and writes any uncompressed data into C<\$buffer>. If the C<Append> parameter is set in the constructor, the uncompressed data will be appended to the C<\$buffer> parameter. Otherwise C<\$buffer> will be overwritten.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

```
=head2 read
```

Usage is

```
$status = $z->read($buffer, $length)
$status = $z->read($buffer, $length, $offset)
```

```
$status = read($z, $buffer, $length)
$status = read($z, $buffer, $length, $offset)
```

Attempt to read C<\$length> bytes of uncompressed data into C<\$buffer>.

The main difference between this form of the C<read> method and the previous one, is that this one will attempt to return I<exactly> C<\$length> bytes. The only circumstances that this function will not is if end-of-file or an IO error is encountered.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

```
=head2 getline
```

Usage is

```
$line = $z->getline()
$line = <$z>
```

Reads a single line.

This method fully supports the use of of the variable C<\$/> (or C<\$INPUT\_RECORD\_SEPARATOR> or C<\$RS> when C<English> is in use) to determine what constitutes an end of line. Paragraph mode, record mode and file slurp mode are all supported.

```
=head2 getc
```

Usage is

```
$char = $z->getc()
```

Read a single character.

```
=head2 ungetc
```

Usage is

```
$char = $z->ungetc($string)
```

```
=head2 inflateSync
```

Usage is

```
$status = $z->inflateSync()
```

TODO

```
=head2 getHeaderInfo
```

Usage is

```
$hdr = $z->getHeaderInfo();  
@hdrs = $z->getHeaderInfo();
```

This method returns either a hash reference (in scalar context) or a list or hash references (in array context) that contains information about each of the header fields in the compressed data stream(s).

```
=head2 tell
```

Usage is

```
$z->tell()  
tell $z
```

Returns the uncompressed file offset.

```
=head2 eof
```

Usage is

```
$z->eof();  
eof($z);
```

Returns true if the end of the compressed input stream has been reached.

=head2 seek

```
$z->seek($position, $whence);  
seek($z, $position, $whence);
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the input file/buffer.

It is a fatal error to attempt to seek backward.

Note that the implementation of C<seek> in this module does not provide true random access to a compressed file/buffer. It works by uncompressing data from the current offset in the file/buffer until it reaches the uncompressed offset specified in the parameters to C<seek>. For very small files this may be acceptable behaviour. For large files it may cause an unacceptable delay.

The C<\$whence> parameter takes one the usual values, namely SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

=head2 binmode

Usage is

```
$z->binmode  
binmode $z ;
```

This is a noop provided for completeness.

=head2 opened

```
$z->opened()
```

Returns true if the object currently refers to a opened file/buffer.

=head2 autoflush

```
my $prev = $z->autoflush()  
my $prev = $z->autoflush(EXPR)
```

If the C<\$z> object is associated with a file or a filehandle, this method returns the current autoflush setting for the underlying filehandle. If C<EXPR> is present,

and is non-zero, it will enable flushing after every write/print operation.

If C<\$z> is associated with a buffer, this method has no effect and always returns C<undef>.

B<Note> that the special variable C<\$|> B<cannot> be used to set or retrieve the autoflush setting.

```
=head2 input_line_number
```

```
$z->input_line_number()  
$z->input_line_number(EXPR)
```

Returns the current uncompressed line number. If C<EXPR> is present it has the effect of setting the line number. Note that setting the line number does not change the current position within the file/buffer being read.

The contents of C<\$/> are used to determine what constitutes a line terminator.

```
=head2 fileno
```

```
$z->fileno()  
fileno($z)
```

If the C<\$z> object is associated with a file or a filehandle, C<fileno> will return the underlying file descriptor. Once the C<close> method is called C<fileno> will return C<undef>.

If the C<\$z> object is associated with a buffer, this method will return C<undef>.

```
=head2 close
```

```
$z->close();  
close $z;
```

Closes the output file/buffer.

For most versions of Perl this method will be automatically invoked if the IO::Uncompress::Unzip object is destroyed (either explicitly or by the variable with the reference to the object going out of scope). The exceptions are Perl versions 5.005 through 5.00504 and 5.8.0. In these cases, the C<close> method will be called automatically, but not until global destruction of all live objects when the program is terminating.

Therefore, if you want your scripts to be able to run on all versions of Perl, you should call `C<close>` explicitly and not rely on automatic closing.

Returns true on success, otherwise 0.

If the `C<AutoClose>` option has been enabled when the `IO::Uncompress::Unzip` object was created, and the object is associated with a file, the underlying file will also be closed.

`=head2 nextStream`

Usage is

```
my $status = $z->nextStream();
```

Skips to the next compressed data stream in the input file/buffer. If a new compressed data stream is found, the eof marker will be cleared and `C<$.>` will be reset to 0.

Returns 1 if a new stream was found, 0 if none was found, and -1 if an error was encountered.

`=head2 trailingData`

Usage is

```
my $data = $z->trailingData();
```

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete. It only makes sense to call this method once the end of the compressed data stream has been encountered.

This option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, `C<trailingData>` will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, `C<trailingData>` will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using C<trailingData> if the input is a filename.

If you know the length of the compressed data stream before you start uncompressing, you can avoid having to use C<trailingData> by setting the C<InputLength> option in the constructor.

=head1 Importing

No symbolic constants are required by this IO::Uncompress::Unzip at present.

=over 5

=item :all

Imports C<unzip> and C<\$UnzipError>.

Same as doing this

```
use IO::Uncompress::Unzip qw(unzip $UnzipError) ;
```

=back

=head1 EXAMPLES

=head2 Working with Net::FTP

See L<IO::Compress::FAQ|IO::Compress::FAQ/"Compressed files and Net::FTP">

=head2 Walking through a zip file

The code below can be used to traverse a zip file, one compressed data stream at a time.

```
use IO::Uncompress::Unzip qw($UnzipError);

my $zipfile = "somefile.zip";
my $u = new IO::Uncompress::Unzip $zipfile
    or die "Cannot open $zipfile: $UnzipError";

my $status;
for ($status = 1; $status
> 0; $status = $u->nextStream())
{

    my $name = $u->getHeaderInfo()->{Name};
    warn "Processing member $name\n" ;

    my $buff;
    while (($status = $u->read($buff)) > 0) {
```

```

    # Do something here
}

last if $status < 0;
}

die "Error processing $zipfile: $!\n"
if $status < 0 ;

```

Each individual compressed data stream is read until the logical end-of-file is reached. Then `C<nextStream>` is called. This will skip to the start of the next compressed data stream and clear the end-of-file flag.

It is also worth noting that `C<nextStream>` can be called at any time -- you don't have to wait until you have exhausted a compressed data stream before skipping to the next one.

=head2 Unzipping a complete zip file to disk

Daniel S. Sterling has written a script that uses `C<IO::Uncompress::UnZip>` to read a zip file and unzip its contents to disk.

The script is available from [L<https://gist.github.com/eqhmcow/5389877>](https://gist.github.com/eqhmcow/5389877)

=head1 NAME

IO::Compress::Base - Base Class for IO::Compress modules

=head1 SYNOPSIS

```
use IO::Compress::Base ;
```

=head1 DESCRIPTION

This module is not intended for direct use in application code. Its sole purpose is to be sub-classed by IO::Compress modules.

=head1 SEE ALSO

=head1 NAME

IO::Compress::FAQ -- Frequently Asked Questions about IO::Compress

=head1 DESCRIPTION

Common questions answered.

=head1 GENERAL

=head2 Compatibility with Unix compress/uncompress.

Although C<Compress::Zlib> has a pair of functions called C<compress> and  
C<uncompress>, they are I<not> related to the Unix programs of the same  
name. The C<Compress::Zlib> module is not compatible with Unix  
C<compress>.

If you have the C<uncompress> program available, you can use this to read  
compressed files

```
open F, "uncompress -c $filename |";
while (<F>)
{
    ...
}
```

Alternatively, if you have the C<gunzip> program available, you can use this to read compressed files

```
open F, "gunzip -c $filename |";
while (<F>)
{
    ...
}
```

and this to write compress files, if you have the C<compress> program available

```
open F, "| compress -c $filename ";
print F "data";
...
close F ;
```

=head2

Accessing .tar.Z files

The C<Archive::Tar> module can optionally use C<Compress::Zlib> (via the C<IO::Zlib> module) to access tar files that have been compressed with C<gzip>. Unfortunately tar files compressed with the Unix C<compress> utility cannot be read by C<Compress::Zlib> and so cannot be directly accessed by C<Archive::Tar>.

If the C<uncompress> or C<gunzip> programs are available, you can use one of these workarounds to read C<.tar.Z> files from C<Archive::Tar>

Firstly with C<uncompress>

```
use strict;
use warnings;
use Archive::Tar;

open F, "uncompress -c $filename |";
my $tar = Archive::Tar->new(*F);
...
```

and this with C<gunzip>

```
use strict;
use warnings;
```

```

use Archive::Tar;

open F, "gunzip -c $filename |";
my $tar = Archive::Tar->new(*F);
...

```

Similarly, if the C<compress> program is available, you can use this to write a C<.tar.Z> file

```

use strict;
use warnings;
use Archive::Tar;
use IO::File;

my
$fh = new IO::File "| compress -c >$filename";
my $tar = Archive::Tar->new();
...
$tar->write($fh);
$fh->close ;

```

=head2 How do I recompress using a different compression?

This is easier than you might expect if you realise that all the C<IO::Compress::\*> objects are derived from C<IO::File> and that all the C<IO::Uncompress::\*> modules can read from an C<IO::File> filehandle.

So, for example, say you have a file compressed with gzip that you want to recompress with bzip2. Here is all that is needed to carry out the recompression.

```

use IO::Uncompress::Gunzip ':all';
use IO::Compress::Bzip2 ':all';

my $gzipFile = "somefile.gz";
my $bzipFile = "somefile.bz2";

my $gunzip = new IO::Uncompress::Gunzip $gzipFile
  or die "Cannot gunzip $gzipFile: $GunzipError\n" ;

bzip2 $gunzip => $bzipFile
  or die "Cannot bzip2 to $bzipFile: $Bzip2Error\n" ;

```

Note, there is a limitation of this technique. Some compression file formats store extra information along with the compressed data payload. For example, gzip can optionally store the original filename and Zip stores a lot of information about the original file. If the original compressed file

contains any of this extra information, it will not be transferred to the new compressed file using the technique above.

=head1 ZIP

=head2 What Compression Types do IO::Compress::Zip & IO::Uncompress::Unzip support?

The following compression formats are supported by C<IO::Compress::Zip> and C<IO::Uncompress::Unzip>

=over 5

=item \* Store (method 0)

No compression at all.

=item \* Deflate (method 8)

This is the default compression used when creating a zip file with C<IO::Compress::Zip>.

=item \* Bzip2 (method 12)

Only supported if the C<IO-Compress-Bzip2> module is installed.

=item \* Lzma (method 14)

Only supported if the C<IO-Compress-Lzma> module is installed.

=back

=head2 Can I Read/Write Zip files larger than 4 Gig?

Yes, both the C<IO-Compress-Zip> and C<IO-Uncompress-Unzip> modules support the zip feature called I<Zip64>. That allows them to read/write files/buffers larger than 4Gig.

If you are creating a Zip file using the one-shot interface, and any of the input files is greater than 4Gig, a zip64 compliant zip file will be created.

```
zip "really-large-file" => "my.zip";
```

Similarly with the one-shot interface, if the input is a buffer larger than 4 Gig, a zip64 compliant zip file will be created.

```
zip \${really_large_buffer} => "my.zip";
```

The one-shot interface allows you to force the creation of a zip64 zip file by including the C<Zip64> option.

```
zip $filehandle => "my.zip", Zip64 => 1;
```

If you want to create a zip64 zip file with the OO interface you must specify the C<Zip64> option.

```
my $zip = new IO::Compress::Zip "whatever", Zip64 => 1;
```

When uncompressing with C<IO-Uncompress-Unzip>, it will automatically detect if the zip file is zip64.

If you intend to manipulate the Zip64 zip files created with C<IO-Compress-Zip> using an external zip/unzip, make sure that it supports Zip64.

In particular, if you are using Info-Zip you need to have zip version 3.x or better to update a Zip64 archive and unzip version 6.x to read a zip64 archive.

=head2 Can I write more than 64K entries in a Zip file?

Yes. Zip64 allows this. See previous question.

=head2 Zip Resources

The primary reference for zip files is the "appnote" document available at L<<http://www.pkware.com/documents/casestudies/APPNOTE.TXT>>

An alternative is the Info-Zip appnote. This is available from L<<ftp://ftp.info-zip.org/pub/infozip/doc/>>

=head1 GZIP

=head2 Gzip Resources

The primary reference for gzip files is RFC 1952 L<<http://www.faqs.org/rfcs/rfc1952.html>>

The primary site for gzip is F<<http://www.gzip.org>>.

=head2 Dealing with Concatenated gzip files

If the gunzip program encounters a file containing multiple gzip files concatenated together it will automatically uncompress them all.

The example below illustrates this behaviour

```
$ echo abc | gzip -c >x.gz
$ echo def | gzip -c >>x.gz
$ gunzip -c x.gz
abc
def
```

By default `C<IO::Uncompress::Gunzip>` will I<not> behave like the `gunzip` program. It will only uncompress the first `gzip` data stream in the file, as shown below

```
$ perl -MIO::Uncompress::Gunzip=all -e 'gunzip "x.gz" => \*STDOUT'
abc
```

To force `C<IO::Uncompress::Gunzip>` to uncompress all the `gzip` data streams, include the `C<MultiStream>` option, as shown below

```
$ perl -MIO::Uncompress::Gunzip=all -e 'gunzip "x.gz" => \*STDOUT, MultiStream => 1'
abc
def
```

=head1 ZLIB

=head2 Zlib Resources

The primary site for the I<zlib> compression library is F<<http://www.zlib.org>>.

=head1 Bzip2

=head2 Bzip2 Resources

The primary site for `bzip2` is F<<http://www.bzip.org>>.

=head2 Dealing with Concatenated `bzip2` files

If the `bunzip2` program encounters a file containing multiple `bzip2` files concatenated together it will automatically uncompress them all.

The example below illustrates this behaviour

```
$ echo abc | bzip2 -c >x.bz2
$ echo def | bzip2 -c >>x.bz2
$ bunzip2 -c x.bz2
abc
def
```

By default C<IO::Uncompress::Bunzip2> will I<not> behave like the bunzip2 program. It will only uncompress the first bunzip2 data stream in the file, as shown below

```
$ perl -MIO::Uncompress::Bunzip2=:all -e 'bunzip2 "x.bz2" => \*STDOUT'  
abc
```

To force C<IO::Uncompress::Bunzip2> to uncompress all the bzip2 data streams, include the C<MultiStream> option, as shown below

```
$ perl -MIO::Uncompress::Bunzip2=:all -e 'bunzip2 "x.bz2" => \*STDOUT, MultiStream => 1'  
abc  
def
```

=head2 Interoperating with Pbzzip2

Pbzzip2 ([L<http://compression.ca/pbzzip2/>](http://compression.ca/pbzzip2/)) is a parallel implementation of bzip2. The output from pbzip2 consists of a series of concatenated bzip2 data streams.

By default C<IO::Uncompress::Bzip2> will only uncompress the first bzip2 data stream in a pbzip2 file. To uncompress the complete pbzip2 file you must include the C<MultiStream> option, like this.

```
bunzip2 $input => \$output, MultiStream => 1  
or die "bunzip2 failed: $Bunzip2Error\n";
```

=head1 HTTP & NETWORK

=head2 Apache::GZip Revisited

Below is a mod\_perl Apache compression module, called C<Apache::GZip>, taken from

F<[http://perl.apache.org/docs/tutorials/tips/mod\\_perl\\_tricks/mod\\_perl\\_tricks.html#On\\_the\\_Fly\\_Compression](http://perl.apache.org/docs/tutorials/tips/mod_perl_tricks/mod_perl_tricks.html#On_the_Fly_Compression)>

```
package Apache::GZip;  
#File: Apache::GZip.pm  
  
use strict vars;  
use Apache::Constants ':common';  
use Compress::Zlib;  
use IO::File;  
use constant GZIP_MAGIC => 0x1f8b;  
use constant OS_MAGIC => 0x03;  
  
sub handler {
```

```

my $r = shift;
my ($fh,$gz);
my $file = $r->filename;
return DECLINED unless $fh=IO::File->new($file);
$r->header_out('Content-Encoding'=>'gzip');
$r->send_http_header;
return OK if $r->header_only;

tie *STDOUT,'Apache::GZip',$r;
print($_) while <$fh>;
untie *STDOUT;
return OK;
}

sub TIEHANDLE {
    my($class,$r) = @_;
    # initialize
    a deflation stream
    my $d = deflateInit(-WindowBits=>-MAX_WBITS()) || return undef;

    # gzip header -- don't ask how I found out
    $r->print(pack("nccVcc",GZIP_MAGIC,Z_DEFLATED,0,time(),0,OS_MAGIC));

    return bless { r => $r,
                  crc => crc32(undef),
                  d => $d,
                  l => 0
                  },$class;
}

sub PRINT {
    my $self = shift;
    foreach (@_) {
        # deflate the data
        my $data = $self->{d}->deflate($_);
        $self->{r}->print($data);
        # keep track of its length and crc
        $self->{l} += length($_);
        $self->{crc} = crc32($_,$self->{crc});
    }
}

sub DESTROY {
    my $self = shift;

    # flush the output buffers
    my $data = $self->{d}->flush;
    $self->{r}->print($data);
}

```

```

# print the CRC and the total length (uncompressed)
$self->{r}->print(pack("LL",@{$self}{qw/crc l/}));
}

1;

```

Here's the Apache configuration entry you'll need to make use of it. Once set it will result in everything in the /compressed directory will be compressed automagically.

```

<Location /compressed>
  SetHandler perl-script
  PerlHandler Apache::GZip
</Location>

```

Although at first sight there seems to be quite a lot going on in C<Apache::GZip>, you could sum up what the code was doing as follows -- read the contents of the file in C<< \$r->filename >>, compress it and write the compressed data to standard output. That's all.

This code has to jump through a few hoops to achieve this because

=over

=item 1.

The gzip support in C<Compress::Zlib> version 1.x can only work with a real filesystem filehandle. The filehandles used by Apache modules are not associated with the filesystem.

=item 2.

That means all the gzip support has to be done by hand - in this case by creating a tied filehandle to deal with creating the gzip header and trailer.

=back

C<IO::Compress::Gzip> doesn't have that filehandle limitation (this was one of the reasons for writing it in the first place). So if C<IO::Compress::Gzip> is used instead of C<Compress::Zlib> the whole tied filehandle code can be removed. Here is the rewritten code.

```

package Apache::GZip;

```

```

use strict vars;
use Apache::Constants ':common';
use IO::Compress::Gzip;
use IO::File;

sub handler {
    my $r = shift;
    my ($fh,$gz);
    my $file = $r->filename;
    return DECLINED unless $fh=IO::File->new($file);
    $r->header_out('Content-Encoding'=>'gzip');
    $r->send_http_header;
    return OK if $r->header_only;

    my $gz = new IO::Compress::Gzip '-', Minimal => 1
        or return DECLINED ;

    print $gz $_ while <$fh>;

    return OK;
}

```

or even more succinctly, like this, using a one-shot gzip

```

package Apache::GZip;

use strict vars;
use Apache::Constants ':common';
use IO::Compress::Gzip qw(gzip);

sub handler {
    my $r = shift;
    $r->header_out('Content-Encoding'=>'gzip');
    $r->send_http_header;
    return OK if $r->header_only;

    gzip $r->filename => '-', Minimal => 1
        or return DECLINED ;

    return OK;
}

1;

```

The use of one-shot C<gzip> above just reads from C<< \$r->filename >> and writes the compressed data to standard output.

Note the use of the C<Minimal> option in the code above. When using gzip

for Content-Encoding you should I<always> use this option. In the example above it will prevent the filename being included in the gzip header and make the size of the gzip data stream a slight bit smaller.

=head2 Compressed files and Net::FTP

The C<Net::FTP> module provides two low-level methods called C<stor> and C<retr> that both return filehandles. These filehandles can be used with the C<IO::Compress/Uncompress> modules to compress or uncompress files read from or written to an FTP Server on the fly, without having to create a temporary file.

Firstly, here is code that uses C<retr> to uncompress a file as it is read from the FTP Server.

```
use Net::FTP;
use IO::Uncompress::Gunzip qw(:all);

my $ftp = new Net::FTP ...

my $retr_fh = $ftp->retr($compressed_filename);
gunzip $retr_fh => $outFilename, AutoClose => 1
    or die "Cannot uncompress '$compressed_file': $GunzipError\n";
```

and this to compress a file as it is written to the FTP Server

```
use Net::FTP;
use IO::Compress::Gzip qw(:all);

my $stor_fh = $ftp->stor($filename);
gzip "filename" => $stor_fh, AutoClose => 1
    or die "Cannot compress '$filename': $GzipError\n";
```

=head1 MISC

=head2 Using C<InputLength> to uncompress data embedded in a larger file/buffer.

A fairly common use-case is where compressed data is embedded in a larger file/buffer and you want to read both.

As an example consider the structure of a zip file. This is a well-defined file format that mixes both compressed and uncompressed sections of data in a single file.

For the purposes of this discussion you can think of a zip file as a sequence of compressed data streams, each of which is prefixed by an uncompressed

local header. The local header contains information about the compressed data stream, including the name of the compressed file and, in particular, the length of the compressed data stream.

To illustrate how to use C<InputLength> here is a script that walks a zip file and prints out how many lines are in each compressed file (if you intend write code to walking through a zip file for real see L<IO::Uncompress::Unzip/"Walking through a zip file"> ). Also, although this example uses the zlib-based compression, the technique can be used by the other C<IO::Uncompress::\*> modules.

```
use strict;
use warnings;

use IO::File;
use IO::Uncompress::RawInflate qw(:all);

use constant ZIP_LOCAL_HDR_SIG => 0x04034b50;
use constant ZIP_LOCAL_HDR_LENGTH => 30;

my $file = $ARGV[0] ;

my $fh = new IO::File "<$file"
    or die "Cannot open '$file': $!\n";

while
(1)
{
    my $sig;
    my $buffer;

    my $x ;
    ($x = $fh->read($buffer, ZIP_LOCAL_HDR_LENGTH)) == ZIP_LOCAL_HDR_LENGTH
        or die "Truncated file: $!\n";

    my $signature = unpack ("V", substr($buffer, 0, 4));

    last unless $signature == ZIP_LOCAL_HDR_SIG;

    # Read Local Header
    my $gpFlag      = unpack ("v", substr($buffer, 6, 2));
    my $compressedMethod = unpack ("v", substr($buffer, 8, 2));
    my $compressedLength = unpack ("V", substr($buffer, 18, 4));
    my $uncompressedLength = unpack ("V", substr($buffer, 22, 4));
    my $filename_length = unpack ("v", substr($buffer, 26, 2));
    my $extra_length = unpack ("v", substr($buffer, 28, 2));

    my $filename ;
```

```

$fh->read($filename, $filename_length) == $filename_length
    or die "Truncated file\n";

$fh->read($buffer, $extra_length) == $extra_length
    or die "Truncated file\n";

if
($compressedMethod != 8 && $compressedMethod != 0)
{
    warn "Skipping file '$filename' - not deflated $compressedMethod\n";
    $fh->read($buffer, $compressedLength) == $compressedLength
        or die "Truncated file\n";
    next;
}

if ($compressedMethod == 0 && $gpFlag & 8 == 8)
{
    die "Streamed Stored not supported for '$filename'\n";
}

next if $compressedLength == 0;

# Done reading the Local Header

my $inf = new IO::Uncompress::RawInflate $fh,
    Transparent => 1,
    InputLength => $compressedLength
    or die "Cannot uncompress $file [$filename]: $RawInflateError\n" ;

my $line_count = 0;

while (<$inf>)
{
    ++ $line_count;
}

print "$filename: $line_count\n";
}

```

The majority of the code above is concerned with reading the zip local header data. The code that I want to focus on is at the bottom.

```

while (1) {

    # read local zip header data
    # get $filename
    # get $compressedLength

```

```

my $inf = new IO::Uncompress::RawInflate $fh,
    Transparent => 1,
    InputLength => $compressedLength
or die "Cannot uncompress $file [$filename]: $RawInflateError\n" ;

my $line_count = 0;

while (<$inf>)
{
    ++ $line_count;
}

print "$filename: $line_count\n";
}

```

The call to `C<IO::Uncompress::RawInflate>` creates a new filehandle `C<$inf>` that can be used to read from the parent filehandle `C<$fh>`, uncompressing it as it goes. The use of the `C<InputLength>` option will guarantee that I<at most> `C<$compressedLength>` bytes of compressed data will be read from the `C<$fh>` filehandle (The only exception is for an error case like a truncated file or a corrupt data stream).

This means that once `RawInflate` is finished `C<$fh>` will be left at the byte directly after the compressed data stream.

Now consider what the code looks like without `C<InputLength>`

```

while (1) {

    # read local zip header data
    # get $filename
    # get $compressedLength

    # read all the compressed data into $data
    read($fh, $data, $compressedLength);

    my $inf = new IO::Uncompress::RawInflate \$data,
        Transparent => 1,
        or die "Cannot uncompress $file [$filename]: $RawInflateError\n" ;

    my $line_count = 0;

    while (<$inf>)
    {
        ++ $line_count;
    }
}

```

```
    print "$filename: $line_count\n";
}
```

The difference here is the addition of the temporary variable `C<$data>`. This is used to store a copy of the compressed data while it is being uncompressed.

If you know that `C<$compressedLength>` isn't that big then using temporary storage won't be a problem. But if `C<$compressedLength>` is very large or you are writing an application that other people will use, and so have no idea how big `C<$compressedLength>` will be, it could be an issue.

Using `C<InputLength>` avoids the use of temporary storage and means the application can cope with large compressed data streams.

One final point -- obviously `C<InputLength>` can only be used whenever you know the length of the compressed data beforehand, like here with a zip file.

=head1 NAME

IO::Uncompress::Inflate - Read RFC 1950 files/buffers

=head1 SYNOPSIS

```
use IO::Uncompress::Inflate qw(inflate $InflateError) ;
```

```
my $status = inflate $input => $output [,OPTS]  
    or die "inflate failed: $InflateError\n";
```

```
my $z = new IO::Uncompress::Inflate $input [OPTS]  
    or die "inflate failed: $InflateError\n";
```

```
$status = $z->read($buffer)  
$status = $z->read($buffer, $length)  
$status = $z->read($buffer, $length, $offset)  
$line = $z->getline()  
$char = $z->getc()  
$char = $z->ungetc()  
$char = $z->opened()
```

```
$status = $z->inflateSync()
```

```
$data = $z->trailingData()  
$status = $z->nextStream()  
$data = $z->getHeaderInfo()  
$z->tell()  
$z->seek($position, $whence)  
$z->binmode()  
$z->fileno()  
$z->eof()  
$z->close()
```

```
$InflateError ;
```

```
# IO::File mode
```

```
<$z>
read($z, $buffer);
read($z, $buffer, $length);
read($z,
$buffer, $length, $offset);
tell($z)
seek($z, $position, $whence)
binmode($z)
fileno($z)
eof($z)
close($z)
```

=head1 DESCRIPTION

This module provides a Perl interface that allows the reading of files/buffers that conform to RFC 1950.

For writing RFC 1950 files/buffers, see the companion module `IO::Compress::Deflate`.

=head1 Functional Interface

A top-level function, `C<inflate>`, is provided to carry out "one-shot" uncompression between buffers and/or files. For finer control over the uncompression process, see the [L<"OO Interface">](#) section.

```
use IO::Uncompress::Inflate qw(inflate $InflateError) ;
```

```
inflate $input_filename_or_reference => $output_filename_or_reference [,OPTS]
    or die "inflate failed: $InflateError\n";
```

The functional interface needs Perl5.005 or better.

=head2 `inflate $input_filename_or_reference => $output_filename_or_reference [, OPTS]`

`C<inflate>` expects at least two parameters, `C<$input_filename_or_reference>` and `C<$output_filename_or_reference>`.

=head3

The `C<$input_filename_or_reference>` parameter

The parameter, `C<$input_filename_or_reference>`, is used to define the source of the compressed data.

It can take one of the following forms:

=over 5

=item A filename

If the `<$input_filename_or_reference>` parameter is a simple scalar, it is assumed to be a filename. This file will be opened for reading and the input data will be read from it.

=item A filehandle

If the `C<$input_filename_or_reference>` parameter is a filehandle, the input data will be read from it. The string '-' can be used as an alias for standard input.

=item A scalar reference

If `C<$input_filename_or_reference>` is a scalar reference, the input data will be read from `C<$$input_filename_or_reference>`.

=item An array reference

If `C<$input_filename_or_reference>` is an array reference, each element in the array must be a filename.

The input data will be read from each file in turn.

The complete array will be walked to ensure that it only contains valid filenames before any data is uncompressed.

=item An Input FileGlob string

If `C<$input_filename_or_reference>` is a string that is delimited by the characters "<" and ">" `C<inflate>` will assume that it is an `I<input fileglob string>`. The input is the list of files that match the fileglob.

See `L<File::GlobMapper|File::GlobMapper>` for more details.

=back

If the `C<$input_filename_or_reference>` parameter is any other type, `C<undef>` will be returned.

=head3 The `C<$output_filename_or_reference>` parameter

The parameter `C<$output_filename_or_reference>` is used to control the destination of the uncompressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the uncompressed data will be written to it.

=item A filehandle

If the C<\$output\_filename\_or\_reference> parameter is a filehandle, the uncompressed data will be written to it. The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output\_filename\_or\_reference> is a scalar reference, the uncompressed data will be stored in C<\$\$output\_filename\_or\_reference>.

=item An Array Reference

If C<\$output\_filename\_or\_reference> is an array reference, the uncompressed data will be pushed onto the array.

=item An Output FileGlob

If C<\$output\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<inflate> will assume that it is an I<output fileglob string>. The output is the list of files that match the fileglob.

When C<\$output\_filename\_or\_reference> is an fileglob string, C<\$input\_filename\_or\_reference> must also be a fileglob string. Anything else is an error.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$output\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head2 Notes

When C<\$input\_filename\_or\_reference> maps to multiple compressed files/buffers and C<\$output\_filename\_or\_reference> is

a single file/buffer, after uncompression C<\$output\_filename\_or\_reference> will contain a concatenation of all the uncompressed data from each of the input files/buffers.

=head2 Optional Parameters

Unless specified below, the optional parameters for C<inflate>, C<OPTS>, are the same as those used with the OO interface defined in the L</"Constructor Options"> section below.

=over 5

=item C<< AutoClose => 0|1 >>

This option applies to any input or output data streams to C<inflate> that are filehandles.

If C<AutoClose> is specified, and the value is true, it will result in all input and/or output filehandles being closed once C<inflate> has completed.

This parameter defaults to 0.

=item C<< BinModeOut => 0|1 >>

When writing to a file or filehandle, set C<binmode> before writing to the file.

Defaults to 0.

=item C<< Append => 0|1 >>

The behaviour of this option is dependent on the type of output data stream.

=over 5

=item \* A Buffer

If C<Append> is enabled, all uncompressed data will be append to the end of the output buffer. Otherwise the output buffer will be cleared before any uncompressed data is written to it.

=item \* A Filename

If C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any uncompressed

data is written to it.

=item \* A Filehandle

If C<Append> is enabled, the filehandle will be positioned to the end of the file via a call to C<seek> before any uncompressed data is written to it. Otherwise the file pointer will not be moved.

=back

When C<Append> is specified, and set to true, it will I<append> all uncompressed data to the output data stream.

So when the output is a filehandle it will carry out a seek to the eof before writing any uncompressed data. If the output is a filename, it will be opened for appending. If the output is a buffer, all uncompressed data will be appended to the existing buffer.

Conversely when C<Append> is not specified, or it is present and is set to false, it will operate as follows.

When the output is a filename, it will truncate the contents of the file before writing any uncompressed data. If the output is a filehandle its position will not be changed. If the output is a buffer, it will be wiped before any uncompressed data is output.

Defaults to 0.

=item C<< MultiStream => 0|1 >>

If the input file/buffer contains multiple compressed data streams, this option will uncompress the whole lot as a single data stream.

Defaults to 0.

=item C<< TrailingData => \$scalar >>

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete.

This option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, C<trailingData> will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, C<trailingData> will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using C<trailingData> if the input is a filename.

If you know the length of the compressed data stream before you start uncompressing, you can avoid having to use C<trailingData> by setting the C<InputLength> option.

=back

=head2 Examples

To read the contents of the file C<file1.txt.1950> and write the uncompressed data to the file C<file1.txt>.

```
use strict ;
use warnings ;
use IO::Uncompress::Inflate qw(inflate $InflateError) ;

my $input = "file1.txt.1950";
my $output = "file1.txt";
inflate $input => $output
    or die "inflate failed: $InflateError\n";
```

To read from an existing Perl filehandle, C<\$input>, and write the uncompressed data to a buffer, C<\$buffer>.

```
use strict ;
use warnings ;
use IO::Uncompress::Inflate qw(inflate $InflateError) ;
use IO::File ;

my $input = new IO::File "<file1.txt.1950"
    or die "Cannot open 'file1.txt.1950': $!\n" ;
my $buffer ;
inflate $input => \ $buffer
    or die "inflate failed: $InflateError\n";
```

To uncompress all files in the directory "/my/home" that match "\*.txt.1950" and store the compressed data in the same directory

```
use strict ;
use warnings ;
```

```
use IO::Uncompress::Inflate qw(inflate $InflateError) ;
```

```
inflate '</my/home/*.txt.1950>' => '</my/home/#1.txt>'  
or die "inflate failed: $InflateError\n";
```

and if you want to compress each file one at a time, this will do the trick

```
use strict ;  
use warnings ;  
use IO::Uncompress::Inflate qw(inflate $InflateError) ;
```

```
for my $input ( glob "/my/home/*.txt.1950" )  
{  
    my $output = $input;  
    $output =~ s/.1950// ;  
    inflate  
$input => $output  
    or die "Error compressing '$input': $InflateError\n";  
}
```

=head1 OO Interface

=head2 Constructor

The format of the constructor for IO::Uncompress::Inflate is shown below

```
my $z = new IO::Uncompress::Inflate $input [OPTS]  
or die "IO::Uncompress::Inflate failed: $InflateError\n";
```

Returns an C<IO::Uncompress::Inflate> object on success and undef on failure.

The variable C<\$InflateError> will contain an error message on failure.

If you are running Perl 5.005 or better the object, C<\$z>, returned from IO::Uncompress::Inflate can be used exactly like an L<IO::File|IO::File> filehandle.

This means that all normal input file operations can be carried out with C<\$z>. For example, to read a line from a compressed file/buffer you can use either of these forms

```
$line = $z->getline();  
$line = <$z>;
```

The mandatory parameter C<\$input> is used to determine the source of the compressed data. This parameter can take one of three forms.

=over 5

=item

A filename

If the C<\$input> parameter is a scalar, it is assumed to be a filename. This file will be opened for reading and the compressed data will be read from it.

=item A filehandle

If the C<\$input> parameter is a filehandle, the compressed data will be read from it.

The string '-' can be used as an alias for standard input.

=item A scalar reference

If C<\$input> is a scalar reference, the compressed data will be read from C<\$\$input>.

=back

=head2 Constructor Options

The option names defined below are case insensitive and can be optionally prefixed by a '-'. So all of the following are valid

- AutoClose
- autoclose
- AUTOCLOSE
- autoclose

OPTS is a combination of the following options:

=over 5

=item C<< AutoClose => 0|1 >>

This option is only valid when the C<\$input> parameter is a filehandle. If specified, and the value is true, it will result in the file being closed once either the C<close> method is called or the IO::Uncompress::Inflate object is destroyed.

This  
parameter defaults to 0.

=item C<< MultiStream => 0|1 >>

Allows multiple concatenated compressed streams to be treated as a single compressed stream. Decompression will stop once either the end of the file/buffer is reached, an error is encountered (premature eof, corrupt compressed data) or the end of a stream is not immediately followed by the

start of another stream.

This parameter defaults to 0.

=item C<< Prime => \$string >>

This option will uncompress the contents of C<\$string> before processing the input file/buffer.

This option can be useful when the compressed data is embedded in another file/data structure and it is not possible to work out where the compressed data begins without having to read the first few bytes. If this is the case, the uncompression can be I<primed> with these bytes using this option.

=item C<< Transparent => 0|1 >>

If this option is set and the input file/buffer is not compressed data, the module will allow reading of it anyway.

In

addition, if the input file/buffer does contain compressed data and there is non-compressed data immediately following it, setting this option will make this module treat the whole file/buffer as a single data stream.

This option defaults to 1.

=item C<< BlockSize => \$num >>

When reading the compressed input data, IO::Uncompress::Inflate will read it in blocks of C<\$num> bytes.

This option defaults to 4096.

=item C<< InputLength => \$size >>

When present this option will limit the number of compressed bytes read from the input file/buffer to C<\$size>. This option can be used in the situation where there is useful data directly after the compressed data stream and you know beforehand the exact length of the compressed data stream.

This option is mostly used when reading from a filehandle, in which case the file pointer will be left pointing to the first byte directly after the compressed data stream.

This option defaults to off.

=item C<< Append => 0|1 >>

This option controls what the C<read> method does with uncompressed data.

If set to 1, all uncompressed data will be appended to the output parameter of the C<read> method.

If set to 0, the contents of the output parameter of the C<read> method will be overwritten by the uncompressed data.

Defaults to 0.

=item C<< Strict => 0|1 >>

This option controls whether the extra checks defined below are used when carrying out the decompression. When Strict is on, the extra tests are carried out, when Strict is off they are not.

The default for this option is off.

=over 5

=item 1

The ADLER32 checksum field must be present.

=item 2

The value of the ADLER32 field read must match the Adler32 value of the uncompressed data actually contained in the file.

=back

=back

=head2 Examples

TODO

=head1 Methods

=head2 read

Usage is

```
$status = $z->read($buffer)
```

Reads a block of compressed data (the size the the compressed block is determined by the C<Buffer> option in the constructor), uncompresses it and writes

any uncompressed data into C<\$buffer>. If the C<Append> parameter is set in the constructor, the uncompressed data will be appended to the C<\$buffer> parameter. Otherwise C<\$buffer> will be overwritten.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

=head2 read

Usage is

```
$status = $z->read($buffer, $length)
$status = $z->read($buffer, $length, $offset)
```

```
$status = read($z, $buffer, $length)
$status = read($z, $buffer, $length, $offset)
```

Attempt to read C<\$length> bytes of uncompressed data into C<\$buffer>.

The main difference between this form of the C<read> method and the previous one, is that this one will attempt to return I<exactly> C<\$length> bytes. The only circumstances that this function will not is if end-of-file or an IO error is encountered.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

=head2 getline

Usage is

```
$line = $z->getline()
$line = <$z>
```

Reads a single line.

This method fully supports the use of of the variable C<\$/> (or C<\$INPUT\_RECORD\_SEPARATOR> or C<\$RS> when C<English> is in use) to determine what constitutes an end of line. Paragraph mode, record mode and file slurp mode are all supported.

=head2 getc

Usage is

```
$char = $z->getc()
```

Read a single character.

```
=head2 ungetc
```

Usage is

```
$char = $z->ungetc($string)
```

```
=head2 inflateSync
```

Usage is

```
$status = $z->inflateSync()
```

TODO

```
=head2 getHeaderInfo
```

Usage is

```
$hdr = $z->getHeaderInfo();  
@hdrs = $z->getHeaderInfo();
```

This method returns either a hash reference (in scalar context) or a list or hash references (in array context) that contains information about each of the header fields in the compressed data stream(s).

```
=head2 tell
```

Usage is

```
$z->tell()  
tell $z
```

Returns the uncompressed file offset.

```
=head2 eof
```

Usage is

```
$z->eof();  
eof($z);
```

Returns true if the end of the compressed input stream has been reached.

=head2 seek

```
$z->seek($position, $whence);  
seek($z, $position, $whence);
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the input file/buffer. It is a fatal error to attempt to seek backward.

Note that the implementation of C<seek> in this module does not provide true random access to a compressed file/buffer. It works by uncompressing data from the current offset in the file/buffer until it reaches the uncompressed offset specified in the parameters to C<seek>. For very small files this may be acceptable behaviour. For large files it may cause an unacceptable delay.

The C<\$whence> parameter takes one the usual values, namely SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

=head2 binmode

Usage is

```
$z->binmode  
binmode $z ;
```

This is a noop provided for completeness.

=head2 opened

```
$z->opened()
```

Returns true if the object currently refers to a opened file/buffer.

=head2 autoflush

```
my $prev = $z->autoflush()  
my $prev = $z->autoflush(EXPR)
```

If the C<\$z> object is associated with a file or a filehandle, this method returns the current autoflush setting for the underlying filehandle. If C<EXPR> is present, and is non-zero, it will enable flushing after every write/print operation.

If C<\$z> is associated with a buffer, this method has no effect and always

returns C<undef>.

B<Note> that the special variable C<\$|> B<cannot> be used to set or retrieve the autoflush setting.

```
=head2 input_line_number
```

```
$z->input_line_number()  
$z->input_line_number(EXPR)
```

Returns the current uncompressed line number. If C<EXPR> is present it has the effect of setting the line number. Note that setting the line number does not change the current position within the file/buffer being read.

The contents of C<\$/> are used to determine what constitutes a line terminator.

```
=head2 fileno
```

```
$z->fileno()  
fileno($z)
```

If the C<\$z> object is associated with a file or a filehandle, C<fileno> will return the underlying file descriptor. Once the C<close> method is called C<fileno> will return C<undef>.

If the C<\$z> object is associated with a buffer, this method will return C<undef>.

```
=head2 close
```

```
$z->close() ;  
close $z ;
```

Closes the output file/buffer.

For most versions of Perl this method will be automatically invoked if the IO::Uncompress::Inflate object is destroyed (either explicitly or by the variable with the reference to the object going out of scope). The exceptions are Perl versions 5.005 through 5.00504 and 5.8.0. In these cases, the C<close> method will be called automatically, but not until global destruction of all live objects when the program is terminating.

Therefore, if you want your scripts to be able to run on all versions of Perl, you should call C<close> explicitly and not rely on automatic closing.

Returns true on success, otherwise 0.

If the C<AutoClose> option has been enabled when the IO::Uncompress::Inflate object

was created, and the object is associated with a file, the underlying file will also be closed.

=head2 nextStream

Usage is

```
my $status = $z->nextStream();
```

Skips to the next compressed data stream in the input file/buffer. If a new compressed data stream is found, the eof marker will be cleared and C<\$.> will be reset to 0.

Returns 1 if a new stream was found, 0 if none was found, and -1 if an error was encountered.

=head2 trailingData

Usage is

```
my $data = $z->trailingData();
```

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete. It only makes sense to call this method once the end of the compressed data stream has been encountered.

This option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, C<trailingData> will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, C<trailingData> will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using C<trailingData> if the input is a filename.

If you know the length of the compressed data stream before you start

uncompressing, you can avoid having to use C<trailingData> by setting the C<InputLength> option in the constructor.

=head1 Importing

No symbolic constants are required by this IO::Uncompress::Inflate at present.

=over 5

=item :all

Imports C<inflate> and C<\$InflateError>.

Same as doing this

```
use IO::Uncompress::Inflate qw(inflate $InflateError) ;
```

=back

```

=head1 DESCRIPTION

The `Compress::Zlib` module provides a Perl interface to the `zlib` compression library (see `L</AUTHOR>` for details about where to get `zlib`).

The `Compress::Zlib` module can be split into two general areas of functionality, namely a simple read/write interface to `gzip` files and

a low-level in-memory compression/decompression interface.

Each of these areas will be discussed in the following sections.

=head2 Notes for users of Compress::Zlib version 1

The main change in C<Compress::Zlib> version 2.x is that it does not now interface directly to the zlib library. Instead it uses the C<IO::Compress::Gzip> and C<IO::Uncompress::Gunzip> modules for reading/writing gzip files, and the C<Compress::Raw::Zlib> module for some low-level zlib access.

The interface provided by version 2 of this module should be 100% backward compatible with version 1. If you find a difference in the expected behaviour please contact the author (See L</AUTHOR>). See L<GZIP INTERFACE>

With the creation of the C<IO::Compress> and C<IO::Uncompress> modules no new features are planned for C<Compress::Zlib> - the new modules do everything that C<Compress::Zlib> does and then some. Development on C<Compress::Zlib> will be limited to bug fixes only.

If you are writing new code, your first port of call should be one of the new C<IO::Compress> or C<IO::Uncompress> modules.

=head1 GZIP INTERFACE

A number of functions are supplied in I<zlib> for reading and writing I<gzip> files that conform to RFC 1952. This module provides an interface to most of them.

If you have previously used C<Compress::Zlib> 1.x, the following enhancements/changes have been made to the C<gzopen> interface:

=over 5

=item 1

If you want to open either STDIN or STDOUT with C<gzopen>, you can now optionally use the special filename "C<->" as a synonym for C<\\\*STDIN> and C<\\\*STDOUT>.

=item 2

In C<Compress::Zlib> version 1.x, C<gzopen> used the zlib library to open the underlying file. This made things especially tricky when a Perl filehandle was passed to C<gzopen>. Behind the scenes the numeric C file descriptor had to be extracted from the Perl filehandle and this passed to

the zlib library.

Apart from being non-portable to some operating systems, this made it difficult to use `C<gzopen>` in situations where you wanted to extract/create a gzip data stream that is embedded in a larger file, without having to resort to opening and closing the file multiple times.

It also made it impossible to pass a perl filehandle that wasn't associated with a real filesystem file, like, say, an `C<IO::String>`.

In `C<Compress::Zlib>` version 2.x, the `C<gzopen>` interface has been completely rewritten to use the `L<IO::Compress::Gzip|IO::Compress::Gzip>` for writing gzip files and `L<IO::Uncompress::Gunzip|IO::Uncompress::Gunzip>` for reading gzip files. None of the limitations mentioned above apply.

=item 3

Addition of `C<gzseek>` to provide a restricted `C<seek>` interface.

=item 4.

Added `C<gztell>`.

=back

A more complete and flexible interface for reading/writing gzip files/buffers is included with the module `C<IO-Compress-Zlib>`. See `L<IO::Compress::Gzip|IO::Compress::Gzip>` and `L<IO::Uncompress::Gunzip|IO::Uncompress::Gunzip>` for more details.

=over 5

=item B<`$gz = gzopen($filename, $mode)>`>

=item

B<`$gz = gzopen($filehandle, $mode)>`>

This function opens either the `I<gzip>` file `C<$filename>` for reading or writing or attaches to the opened filehandle, `C<$filehandle>`. It returns an object on success and `C<undef>` on failure.

When writing a gzip file this interface will `I<always>` create the smallest possible gzip header (exactly 10 bytes). If you want greater control over what gets stored in the gzip header (like the original filename or a comment) use `L<IO::Compress::Gzip|IO::Compress::Gzip>` instead. Similarly if you want to read the contents of the gzip header use `L<IO::Uncompress::Gunzip|IO::Uncompress::Gunzip>`.

The second parameter, C<\$mode>, is used to specify whether the file is opened for reading or writing and to optionally specify a compression level and compression strategy when writing. The format of the C<\$mode> parameter is similar to the mode parameter to the 'C' function C<fopen>, so "rb" is used to open for reading, "wb" for writing and "ab" for appending (writing at the end of the file).

To specify a compression level when writing, append a digit between 0 and 9 to the mode string -- 0 means no compression and 9 means maximum compression.

If no compression level is specified Z\_DEFAULT\_COMPRESSION is used.

To specify the compression strategy when writing, append 'f' for filtered data, 'h' for Huffman only compression, or 'R' for run-length encoding. If no strategy is specified Z\_DEFAULT\_STRATEGY is used.

So, for example, "wb9" means open for writing with the maximum compression using the default strategy and "wb4R" means open for writing with compression level 4 and run-length encoding.

Refer to the I<zlib> documentation for the exact format of the C<\$mode> parameter.

```
=item B<$bytesread = $gz-E<gt>gzread($buffer [, $size]) ;>
```

Reads C<\$size> bytes from the compressed file into C<\$buffer>. If C<\$size> is not specified, it will default to 4096. If the scalar C<\$buffer> is not large enough, it will be extended automatically.

Returns

the number of bytes actually read. On EOF it returns 0 and in the case of an error, -1.

```
=item B<$bytesread = $gz-E<gt>gzreadline($line) ;>
```

Reads the next line from the compressed file into C<\$line>.

Returns the number of bytes actually read. On EOF it returns 0 and in the case of an error, -1.

It is legal to intermix calls to C<gzread> and C<gzreadline>.

To maintain backward compatibility with version 1.x of this module C<gzreadline> ignores the C<\$/> variable - it I<always> uses the string C<"\n"> as the line delimiter.

If you want to read a gzip file a line at a time and have it respect the C<\$/> variable (or C<\$INPUT\_RECORD\_SEPARATOR>, or C<\$RS> when C<English> is in use) see L<IO::Uncompress::Gunzip|IO::Uncompress::Gunzip>.

```
=item B<$byteswritten = $gz-E<gt>gzwrite($buffer) ;>
```

Writes the contents of C<\$buffer> to the compressed file. Returns the number of bytes actually written, or 0 on error.

```
=item B<$status = $gz-E<gt>gzflush($flush_type) ;>
```

Flushes all pending output into the compressed file.

This method takes an optional parameter, C<\$flush\_type>, that controls how the flushing will be carried out. By default the C<\$flush\_type> used is C<Z\_FINISH>. Other valid values for C<\$flush\_type> are C<Z\_NO\_FLUSH>, C<Z\_SYNC\_FLUSH>, C<Z\_FULL\_FLUSH> and C<Z\_BLOCK>. It is strongly recommended that you only set the C<flush\_type> parameter if you fully understand the implications of what it does - overuse of C<flush> can seriously degrade the level of compression achieved. See the C<zlib> documentation for details.

Returns 0 on success.

```
=item B<$offset = $gz-E<gt>gztell() ;>
```

Returns the uncompressed file offset.

```
=item B<$status = $gz-E<gt>gzseek($offset, $whence) ;>
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the compressed file.

It is a fatal error to attempt to seek backward.

When opened for writing, empty parts of the file will have NULL (0x00) bytes written to them.

The C<\$whence> parameter should be one of SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

```
=item B<$gz-E<gt>gzclose>
```

Closes the compressed file. Any pending data is flushed to the file before it is closed.

Returns 0 on success.

=item B<\$gz-E<gt>gzsetparams(\$level, \$strategy)>

Change settings for the deflate stream C<\$gz>.

The list of the valid options is shown below. Options not specified will remain unchanged.

Note: This method is only available if you are running zlib 1.0.6 or better.

=over 5

=item B<\$level>

Defines the compression level. Valid values are 0 through 9, C<Z\_NO\_COMPRESSION>, C<Z\_BEST\_SPEED>, C<Z\_BEST\_COMPRESSION>, and C<Z\_DEFAULT\_COMPRESSION>.

=item B<\$strategy>

Defines the strategy used to tune the compression. The valid values are C<Z\_DEFAULT\_STRATEGY>, C<Z\_FILTERED> and C<Z\_HUFFMAN\_ONLY>.

=back

=item B<\$gz-E<gt>gzerror>

Returns the I<zlib> error message or number for the last operation associated with C<\$gz>. The return value will be the I<zlib> error number

when used in a numeric context and the I<zlib> error message when used in a string context. The I<zlib> error number constants, shown below, are available for use.

Z\_OK  
Z\_STREAM\_END  
Z\_ERRNO  
Z\_STREAM\_ERROR  
Z\_DATA\_ERROR  
Z\_MEM\_ERROR  
Z\_BUF\_ERROR

=item B<\$gzerrno>

The C<\$gzerrno> scalar holds the error code associated with the most recent I<gzip> routine. Note that unlike C<gzerror()>, the error is I<not> associated with a particular file.

As with `C<gzerror()>` it returns an error number in numeric context and an error message in string context. Unlike `C<gzerror()>` though, the error message will correspond to the `I<zlib>` message when the error is associated with `I<zlib>` itself, or the UNIX error message when it is not (i.e. `I<zlib>` returned `C<Z_ERRORNO>`).

As there is an overlap between the error numbers used by `I<zlib>` and UNIX, `C<$gzerrno>` should only be used to check for the presence of `I<an>` error in numeric context. Use `C<gzerror()>` to check for specific `I<zlib>` errors. The `I<gzcat>` example below shows how the variable can be used safely.

=back

=head2 Examples

Here is an example script which uses the interface. It implements a `I<gzcat>` function.

```
use strict ;
use warnings ;

use Compress::Zlib ;

# use stdin if no files supplied
@ARGV = '-' unless @ARGV ;

foreach my $file (@ARGV) {
    my $buffer ;

    my $gz = gzopen($file, "rb")
        or die "Cannot open $file: $gzerrno\n" ;

    print $buffer while $gz->gzread($buffer) > 0 ;

    die "Error reading from $file: $gzerrno" . ($gzerrno+0) . "\n"
        if $gzerrno != Z_STREAM_END ;

    $gz->gzclose() ;
}
```

Below is a script which makes use of `C<gzreadline>`. It implements a very simple `I<grep>` like script.

```
use strict ;
use warnings ;
```

```

use Compress::Zlib ;

die "Usage: gzgrep pattern [file...]\n"
  unless @ARGV >= 1;

my $pattern = shift ;

# use stdin if no files supplied
@ARGV = '-' unless @ARGV ;

foreach my $file (@ARGV) {
  my $gz = gzopen($file, "rb")
    or die "Cannot open $file: $gzerrno\n" ;

  while ($gz->gzreadline($_) > 0) {
    print if /$pattern/ ;
  }

  die "Error reading from $file: $gzerrno\n"
    if $gzerrno != Z_STREAM_END ;

  $gz->gzclose() ;
}

```

This script, I<gzstream>, does the opposite of the I<gzcat> script above. It reads from standard input and writes a gzip data stream to standard output.

```

use strict ;
use warnings ;

use Compress::Zlib ;

binmode STDOUT; # gzopen only sets it on the fd

my $gz = gzopen(\*STDOUT, "wb")
  or die "Cannot open stdout: $gzerrno\n" ;

while (<>) {
  $gz->gzwrite($_)
    or die "error writing: $gzerrno\n" ;
}

$gz->gzclose ;

=head2 Compress::Zlib::memGzip

```

This function is used to create an in-memory gzip file with the minimum possible gzip header (exactly 10 bytes).

```
$dest = Compress::Zlib::memGzip($buffer)
    or die "Cannot compress: $gzerrno\n";
```

If successful, it returns the in-memory gzip file. Otherwise it returns C<undef> and the C<\$gzerrno> variable will store the zlib error code.

The C<\$buffer> parameter can either be a scalar or a scalar reference.

See L<IO::Compress::Gzip|IO::Compress::Gzip> for an alternative way to carry out in-memory gzip compression.

```
=head2 Compress::Zlib::memGunzip
```

This function is used to uncompress an in-memory gzip file.

```
$dest = Compress::Zlib::memGunzip($buffer)
    or die "Cannot uncompress: $gzerrno\n";
```

If successful, it returns the uncompressed gzip file. Otherwise it returns C<undef> and the C<\$gzerrno> variable will store the zlib error code.

The C<\$buffer> parameter can either be a scalar or a scalar reference. The contents of the C<\$buffer> parameter are destroyed after calling this function.

If C<\$buffer> consists of multiple concatenated gzip data streams only the first will be uncompressed. Use C<gunzip> with the C<MultiStream> option in the C<IO::Uncompress::Gunzip> module if you need to deal with concatenated data streams.

See L<IO::Uncompress::Gunzip|IO::Uncompress::Gunzip> for an alternative way to carry out in-memory gzip uncompression.

```
=head1 COMPRESS/UNCOMPRESS
```

Two functions are provided to perform in-memory compression/uncompression of RFC 1950 data streams. They are called C<compress> and C<uncompress>.

```
=over 5
```

```
=item B<$dest = compress($source [, $level] ) ;>
```

Compresses C<\$source>. If successful it returns the compressed data. Otherwise it returns I<undef>.

The source buffer, C<\$source>, can either be a scalar or a scalar reference.

The C<\$level> parameter defines the compression level. Valid values are 0 through 9, C<Z\_NO\_COMPRESSION>, C<Z\_BEST\_SPEED>, C<Z\_BEST\_COMPRESSION>, and C<Z\_DEFAULT\_COMPRESSION>. If C<\$level> is not specified C<Z\_DEFAULT\_COMPRESSION> will be used.

=item

```
B<$dest = uncompress($source) ;>
```

Uncompresses C<\$source>. If successful it returns the uncompressed data. Otherwise it returns I<undef>.

The source buffer can either be a scalar or a scalar reference.

=back

Please note: the two functions defined above are I<not> compatible with the Unix commands of the same name.

See L<IO::Deflate|IO::Deflate> and L<IO::Inflate|IO::Inflate> included with this distribution for an alternative interface for reading/writing RFC 1950 files/buffers.

=head1 Deflate Interface

This section defines an interface that allows in-memory compression using the I<deflate> interface provided by zlib.

Here is a definition of the interface available:

```
=head2 B<($d, $status) = deflateInit( [OPT] )>
```

Initialises a deflation stream.

It combines the features of the I<zlib> functions C<deflateInit>, C<deflateInit2> and C<deflateSetDictionary>.

If successful, it will return the initialised deflation stream, C<\$d> and C<\$status> of C<Z\_OK> in a list context. In scalar context it returns the deflation stream, C<\$d>, only.

If not successful, the returned deflation stream (C<\$d>) will be

I<undef> and C<\${status}> will hold the exact I<zlib> error code.

The function optionally takes a number of named options specified as C<< -Name=>value >> pairs. This allows individual options to be tailored without having to specify them all in the parameter list.

For backward compatibility, it is also possible to pass the parameters as a reference to a hash containing the name=>value pairs.

The function takes one optional parameter, a reference to a hash. The contents of the hash allow the deflation interface to be tailored.

Here is a list of the valid options:

=over 5

=item B<-Level>

Defines the compression level. Valid values are 0 through 9, C<Z\_NO\_COMPRESSION>, C<Z\_BEST\_SPEED>, C<Z\_BEST\_COMPRESSION>, and C<Z\_DEFAULT\_COMPRESSION>.

The default is Z\_DEFAULT\_COMPRESSION.

=item B<-Method>

Defines the compression method. The only valid value at present (and the default) is Z\_DEFLATED.

=item B<-WindowBits>

To create an RFC 1950 data stream, set C<WindowBits> to a positive number.

To create an RFC 1951 data stream, set C<WindowBits> to C<-MAX\_WBITS>.

For a full definition of the meaning and valid values for C<WindowBits> refer to the I<zlib> documentation for I<deflateInit2>.

Defaults to MAX\_WBITS.

=item B<-MemLevel>

For a definition of the meaning and valid values for C<MemLevel> refer to the I<zlib> documentation for I<deflateInit2>.

Defaults to MAX\_MEM\_LEVEL.

=item B<-Strategy>

Defines the strategy used to tune the compression. The valid values are C<Z\_DEFAULT\_STRATEGY>, C<Z\_FILTERED> and C<Z\_HUFFMAN\_ONLY>.

The default is Z\_DEFAULT\_STRATEGY.

=item B<-Dictionary>

When a dictionary is specified I<Compress::Zlib> will automatically call C<deflateSetDictionary> directly after calling C<deflateInit>. The Adler32 value for the dictionary can be obtained by calling the method C<\$d->dict\_adler()>.

The default is no dictionary.

=item

B<-Bufsize>

Sets the initial size for the deflation buffer. If the buffer has to be reallocated to increase the size, it will grow in increments of C<Bufsize>.

The default is 4096.

=back

Here is an example of using the C<deflateInit> optional parameter list to override the default buffer size and compression level. All other options will take their default values.

```
deflateInit( -Bufsize => 300,  
            -Level => Z_BEST_SPEED );
```

=head2 B<(\$out, \$status) = \$d-E<gt>deflate(\$buffer)>

Deflates the contents of C<\$buffer>. The buffer can either be a scalar or a scalar reference. When finished, C<\$buffer> will be completely processed (assuming there were no errors). If the deflation was successful it returns the deflated output, C<\$out>, and a status value, C<\$status>, of C<Z\_OK>.

On error, C<\$out> will be I<undef> and C<\$status> will contain the I<zlib> error code.

In a scalar context C<deflate> will return C<\$out> only.

As with the I<deflate> function in

I<zlib>, it is not necessarily the case that any output will be produced by this method. So don't rely on the fact that C<\$out> is empty for an error test.

```
=head2 B<($out, $status) = $d-E<gt>flush()>
=head2 B<($out, $status) = $d-E<gt>flush($flush_type)>
```

Typically used to finish the deflation. Any pending output will be returned via C<\$out>.

C<\$status> will have a value C<Z\_OK> if successful.

In a scalar context C<flush> will return C<\$out> only.

Note that flushing can seriously degrade the compression ratio, so it should only be used to terminate a decompression (using C<Z\_FINISH>) or when you want to create a I<full flush point> (using C<Z\_FULL\_FLUSH>).

By default the C<flush\_type> used is C<Z\_FINISH>. Other valid values for C<flush\_type> are C<Z\_NO\_FLUSH>, C<Z\_PARTIAL\_FLUSH>, C<Z\_SYNC\_FLUSH> and C<Z\_FULL\_FLUSH>. It is strongly recommended that you only set the C<flush\_type> parameter if you fully understand the implications of what it does. See the C<zlib> documentation for details.

```
=head2
B<$status = $d-E<gt>deflateParams([OPT])>
```

Change settings for the deflate stream C<\$d>.

The list of the valid options is shown below. Options not specified will remain unchanged.

```
=over 5
```

```
=item B<-Level>
```

Defines the compression level. Valid values are 0 through 9, C<Z\_NO\_COMPRESSION>, C<Z\_BEST\_SPEED>, C<Z\_BEST\_COMPRESSION>, and C<Z\_DEFAULT\_COMPRESSION>.

```
=item B<-Strategy>
```

Defines the strategy used to tune the compression. The valid values are C<Z\_DEFAULT\_STRATEGY>, C<Z\_FILTERED> and C<Z\_HUFFMAN\_ONLY>.

```
=back
```

```
=head2 B<$d-E<gt>dict_adler()>
```

Returns the Adler32 value for the dictionary.

```
=head2 B<$d-E<gt>msg()
```

Returns the last error message generated by zlib.

```
=head2 B<$d-E<gt>total_in()
```

Returns the total number of bytes uncompressed bytes input to deflate.

```
=head2 B<$d-E<gt>total_out()
```

Returns the total number of compressed bytes output from deflate.

```
=head2 Example
```

Here is a trivial example of using C<deflate>. It simply reads standard input, deflates it and writes it to standard output.

```
use strict ;
use warnings ;

use Compress::Zlib ;

binmode STDIN;
binmode STDOUT;
my $x = deflateInit()
    or die "Cannot create a deflation stream\n" ;

my ($output, $status) ;
while (<>)
{
    ($output, $status) = $x->deflate($_) ;

    $status == Z_OK
        or die "deflation failed\n" ;

    print $output ;
}

($output, $status) = $x->flush() ;

$status == Z_OK
    or die "deflation failed\n" ;

print $output ;
```

## =head1 Inflate Interface

This section defines the interface available that allows in-memory uncompression using the I<deflate> interface provided by zlib.

Here is a definition of the interface:

```
=head2 B<($i, $status) = inflateInit(>
```

Initialises an inflation stream.

In a list context it returns the inflation stream, C<\$i>, and the I<zlib> status code in C<\$status>. In a scalar context it returns the inflation stream only.

If successful,

C<\$i> will hold the inflation stream and C<\$status> will be C<Z\_OK>.

If not successful, C<\$i> will be I<undef> and C<\$status> will hold the I<zlib> error code.

The function optionally takes a number of named options specified as C<< -Name=>value >> pairs. This allows individual options to be tailored without having to specify them all in the parameter list.

For backward compatibility, it is also possible to pass the parameters as a reference to a hash containing the name=>value pairs.

The function takes one optional parameter, a reference to a hash. The contents of the hash allow the deflation interface to be tailored.

Here is a list of the valid options:

```
=over 5
```

```
=item B<-WindowBits>
```

To uncompress an RFC 1950 data stream, set C<WindowBits> to a positive number.

To uncompress an RFC 1951 data stream, set C<WindowBits> to C<-MAX\_WBITS>.

For a full definition of the meaning and valid values for C<WindowBits> refer to the I<zlib> documentation for I<inflateInit2>.

Defaults to

MAX\_WBITS.

=item B<-Bufsize>

Sets the initial size for the inflation buffer. If the buffer has to be reallocated to increase the size, it will grow in increments of C<Bufsize>.

Default is 4096.

=item B<-Dictionary>

The default is no dictionary.

=back

Here is an example of using the C<inflateInit> optional parameter to override the default buffer size.

```
inflateInit( -Bufsize => 300 ) ;
```

=head2 B<(\$out, \$status) = \$i-E<gt>inflate(\$buffer)>

Inflates the complete contents of C<\$buffer>. The buffer can either be a scalar or a scalar reference.

Returns C<Z\_OK> if successful and C<Z\_STREAM\_END> if the end of the compressed data has been successfully reached.

If not successful, C<\$out> will be I<undef> and C<\$status> will hold the I<zlib> error code.

The C<\$buffer> parameter is modified by C<inflate>. On completion it will contain what remains of the input buffer after inflation. This means that C<\$buffer> will be an empty string when the return status is C<Z\_OK>. When the return status is C<Z\_STREAM\_END> the C<\$buffer> parameter will contain what (if anything) was stored in the input buffer after the deflated data stream.

This feature is useful when processing a file format that encapsulates a compressed data stream (e.g. gzip, zip).

=head2 B<\$status = \$i-E<gt>inflateSync(\$buffer)>

Scans C<\$buffer> until it reaches either a I<full flush point> or the end of the buffer.

If a I<full flush point> is found, C<Z\_OK> is returned and C<\$buffer> will have all data up to the flush point removed. This can then be passed to the C<deflate> method.

Any other return code means that a flush point was not found. If more data is available, C<inflateSync> can be called repeatedly with more compressed data until the flush point is found.

```
=head2 B<$i-E<gt>dict_adler()>
```

Returns the Adler32 value for the dictionary.

```
=head2 B<$i-E<gt>msg()>
```

Returns the last error message generated by zlib.

```
=head2 B<$i-E<gt>total_in()>
```

Returns the total number of bytes compressed bytes input to inflate.

```
=head2 B<$i-E<gt>total_out()>
```

Returns the total number of uncompressed bytes output from inflate.

```
=head2 Example
```

Here is an example of using C<inflate>.

```
use strict ;
use warnings ;

use Compress::Zlib ;

my $x = inflateInit()
  or die "Cannot create a inflation stream\n" ;

my $input = " ;
binmode STDIN;
binmode STDOUT;

my ($output, $status) ;
while (read(STDIN, $input, 4096))
{
  ($output, $status) = $x->inflate(\$input) ;

  print $output
    if $status == Z_OK or $status == Z_STREAM_END ;

  last if $status != Z_OK ;
}
```

```
die "inflation failed\n"
unless $status == Z_STREAM_END ;
```

## =head1 CHECKSUM FUNCTIONS

Two functions are provided by I<zlib> to calculate checksums. For the Perl interface, the order of the two parameters in both functions has been reversed. This allows both running checksums and one off calculations to be done.

```
$crc
= Adler32($buffer [, $crc] );
$crc = CRC32($buffer [, $crc] );
```

The buffer parameters can either be a scalar or a scalar reference.

If the \$crc parameters is C<undef>, the crc value will be reset.

If you have built this module with zlib 1.2.3 or better, two more CRC-related functions are available.

```
$crc = Adler32_combine($crc1, $crc2, $len2)
$crc = CRC32_combine($adler1, $adler2, $len2)
```

These functions allow checksums to be merged.

## =head1 Misc

```
=head2 my $version = Compress::Zlib::zlib_version();
```

Returns the version of the zlib library.

## =head1 CONSTANTS

All the I<zlib> constants are automatically imported when you make use of I<Compress::Zlib>.

=head1 NAME

zipdetails - display the internal structure of zip files

=head1 SYNOPSIS

zipdetaile [-v] zipfile.zip

zipdetails -h

=head1 DESCRIPTION

Zipdetails displays information about the internal record structure of the zip file. It is not concerned with displaying any details of the compressed data stored in the zip file.

The program assumes prior understanding of the internal structure of a Zip file. You should have a copy of the Zip APPNOTE file at hand to help understand the output from this program (L<SEE ALSO> for details).

=head2 OPTIONS

=over 5

=item -v

Enable Verbose mode

=item -h

Display help

=back

By default zipdetails will output the details of the zip file in three columns.

=over 5

=item Column 1

This contains the offset from the start of the file in hex.

=item Column 2

This contains a textual description of the field.

=item Column 3

If the field contains a numeric value it will be displayed in hex. Zip stored most numbers in little-endian format - the value displayed will have the little-endian encoding removed.

Next, is an optional description of what the value means.

=back

If the C<-v> option is present, column 1 is expanded to include

=over 5

=item \*

The offset from the start of the file in hex.

=item \*

The length of the file in hex.

=item \*

A hex dump of the bytes in field in the order they are stored in the zip file.

=back

=head1 TODO

Error handling is still a work in progress. If the program encounters a problem reading a zip file it is likely to terminate with an unhelpful error message.

=head1 SEE ALSO

The primary reference for Zip files is the "appnote" document available at L<<http://www.pkware.com/documents/casestudies/APPNOTE.TXT>>.

An alternative reference is the Info-Zip appnote. This is available from L<<ftp://ftp.info-zip.org/pub/infozip/doc/>>

The C<zipinfo> program that comes with the info-zip distribution (L<<http://www.info-zip.org/>>) can also display details of the structure of a zip file.

See also L<Archive::Zip::SimpleZip>, L<IO::Compress::Zip>, L<IO::Uncompress::Unzip>.

Test::Simple will start by printing number of tests run in the form "1..M" (so "1..5" means you're going to run 5 tests). This strange format lets Test::Harness know how many tests you plan on running in case something goes horribly wrong.

If all your tests passed, Test::Simple will exit with zero (which is normal). If anything failed it will exit with how many failed. If you run less (or more) tests than you planned, the missing (or extras) will be considered failures. If no tests were ever run Test::Simple will throw a warning and exit with 255. If the test died, even after having successfully completed all its tests, it will still be considered a failure and will exit with 255.

So the exit codes are...

|                  |   |
|------------------|---|
| 0                | all tests successful                          |
| 255              | test died                                     |
| any other number | how many failed (including missing or extras) |

If you fail more than 254 tests, it will be reported as 254.

This module is by no means trying to be a complete testing system. It's just to get you started. Once you're off the ground its recommended you look at L<Test::More>.

=head1 EXAMPLE

Here's an example of a simple .t file for the fictional Film module.

```
use Test::Simple tests => 5;

use Film; # What you're testing.

my $btaste = Film->new({ Title => 'Bad Taste',
                      Director => 'Peter Jackson',
                      Rating => 'R',
                      NumExplodingSheep => 1
                      });
ok( defined($btaste) && ref $btaste eq 'Film, 'new() works' );

ok( $btaste->Title eq 'Bad Taste', 'Title() get' );
ok( $btaste->Director eq 'Peter Jackson', 'Director() get' );
ok( $btaste->Rating eq 'R', 'Rating() get' );
ok( $btaste->NumExplodingSheep == 1, 'NumExplodingSheep() get' );
```

It will produce output like this:

```
1..5
ok 1 - new() works
ok 2 - Title() get
ok 3 - Director() get
not ok 4 - Rating() get
# Failed test (t/film.t at line 14)
ok 5 - NumExplodingSheep() get
# Looks like you failed 1 tests of 5
```

Indicating the Film::Rating() method is broken.

=head1 CAVEATS

Test::Simple will only report a maximum of 254 failures in its exit code. If this is a problem, you probably have a huge test script. Split it into multiple files. (Otherwise blame the Unix folks for using an unsigned short integer as the exit status).

Because VMS's exit codes are much, much different than the rest of the universe, and perl does horrible mangling to them that gets in my way, it works like this on VMS.

```
0  SS$_NORMAL    all tests successful
4  SS$_ABORT     something went wrong
```

Unfortunately, I can't differentiate any further.

## =head1 NOTES

Test::Simple is B<explicitly> tested all the way back to perl 5.004.

Test::Simple is thread-safe in perl 5.8.0 and up.

## =head1 HISTORY

This module

was conceived while talking with Tony Bowden in his kitchen one night about the problems I was having writing some really complicated feature into the new Testing module. He observed that the main problem is not dealing with these edge cases but that people hate to write tests B<at all>. What was needed was a dead simple module that took all the hard work out of testing and was really, really easy to learn. Paul Johnson simultaneously had this idea (unfortunately, he wasn't in Tony's kitchen). This is it.

## =head1 SEE ALSO

=over 4

=item L<Test::More>

More testing functions! Once you outgrow Test::Simple, look at Test::More. Test::Simple is 100% forward compatible with Test::More (i.e. you can just use Test::More instead of Test::Simple in your programs and things will still work).

=item L<Test>

The original Perl testing module.

=item L<Test::Unit>

Elaborate unit testing.

=item L<Test::Inline>, L<SelfTest>

Embed tests in your code!

=item L<Test::Harness>

Interprets

the output of your test program.

No license file was found, but licenses were detected in source scan.

=head1 EXIT CODES

If all your tests passed, Test::Builder will exit with zero (which is normal). If anything failed it will exit with how many failed. If you run less (or more) tests than you planned, the missing (or extras) will be considered failures. If no tests were ever run Test::Builder will throw a warning and exit with 255. If the test died, even after having successfully completed all its tests, it will still be considered a failure and will exit with 255.

So the exit codes are...

|                  |   |
|------------------|---|
| 0                | all tests successful                          |
| 255              | test died                                     |
| any other number | how many failed (including missing or extras) |

If you fail more than 254 tests, it will be reported as 254.

=head1 THREADS

In perl 5.8.0 and later, Test::Builder is thread-safe. The test

number is shared amongst all threads. This means if one thread sets the test number using `current_test()` they will all be effected.

`Test::Builder`

is only thread-aware if `threads.pm` is loaded I<before>

`Test::Builder`.

=head1 EXAMPLES

CPAN can provide the best examples. `Test::Simple`, `Test::More`, `Test::Exception` and `Test::Differences` all use `Test::Builder`.

=head1 NAME

`IO::Compress::Zip` - Write zip files/buffers

=head1 SYNOPSIS

```
use IO::Compress::Zip qw(zip $ZipError) ;
```

```
my $status = zip $input => $output [,OPTS]
    or die "zip failed: $ZipError\n";

my $z = new IO::Compress::Zip $output [,OPTS]
    or die "zip failed: $ZipError\n";
```

```
$z->print($string);
$z->printf($format, $string);
$z->write($string);
$z->syswrite($string [, $length, $offset]);
$z->flush();
$z->tell();
$z->eof();
$z->seek($position, $whence);
$z->binmode();
$z->fileno();
$z->opened();
$z->autoflush();
$z->input_line_number();
$z->newStream( [OPTS] );
```

```
$z->deflateParams();
```

```
$z->close() ;
```

```
$ZipError ;
```

```
# IO::File mode
```

```
print $z $string;
printf $z $format, $string;
tell $z
eof $z
seek $z, $position, $whence
binmode $z
fileno $z
close $z ;
```

=head1 DESCRIPTION

This module provides a Perl interface that allows writing zip compressed data to files or buffer.

The primary purpose of this module is to provide streaming write access to zip files and buffers. It is not a general-purpose file archiver. If that

is what you want, check out C<Archive::Zip>.

At present three compression methods are supported by IO::Compress::Zip, namely Store (no compression at all), Deflate, Bzip2 and LZMA.

Note that to create Bzip2 content, the module C<IO::Compress::Bzip2> must be installed.

Note that to create LZMA content, the module C<IO::Compress::Lzma> must be installed.

For reading zip files/buffers, see the companion module L<IO::Uncompress::Unzip|IO::Uncompress::Unzip>.

=head1 Functional Interface

A top-level function, C<zip>, is provided to carry out "one-shot" compression between buffers and/or files. For finer control over the compression process, see the L<"OO Interface"> section.

```
use IO::Compress::Zip qw(zip $ZipError) ;

zip $input_filename_or_reference
=> $output_filename_or_reference [,OPTS]
  or die "zip failed: $ZipError\n";
```

The functional interface needs Perl5.005 or better.

=head2 zip \$input\_filename\_or\_reference => \$output\_filename\_or\_reference [, OPTS]

C<zip> expects at least two parameters, C<\$input\_filename\_or\_reference> and C<\$output\_filename\_or\_reference>.

=head3 The C<\$input\_filename\_or\_reference> parameter

The parameter, C<\$input\_filename\_or\_reference>, is used to define the source of the uncompressed data.

It can take one of the following forms:

=over 5

=item A filename

If the C<\$input\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for reading and the input data will be read from it.

=item A filehandle

If the C<\$input\_filename\_or\_reference> parameter is a filehandle, the input data will be read from it. The string '-' can be used as an alias for standard input.

=item A scalar reference

If C<\$input\_filename\_or\_reference> is a scalar reference, the input data will be read from C<\$\$input\_filename\_or\_reference>.

=item An array reference

If C<\$input\_filename\_or\_reference> is an array reference, each element in the array must be a filename.

The input data will be read from each file in turn.

The complete array will be walked to ensure that it only contains valid filenames before any data is compressed.

=item An Input FileGlob string

If C<\$input\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<zip> will assume that it is an I<input fileglob string>. The input is the list of files that match the fileglob.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$input\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

In addition, if C<\$input\_filename\_or\_reference> is a simple filename, the default values for the C<Name>, C<Time>, C<TextFlag>, C<ExtAttr>, C<exUnixN> and C<exTime> options will be sourced from that file.

If you do not want to use these defaults they can be overridden by explicitly setting the C<Name>, C<Time>, C<TextFlag>, C<ExtAttr>, C<exUnixN> and C<exTime> options or by setting the C<Minimal> parameter.

=head3 The C<\$output\_filename\_or\_reference> parameter

The parameter C<\$output\_filename\_or\_reference> is used to control the destination of the compressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the compressed data will be written to it.

=item A filehandle

If the C<\$output\_filename\_or\_reference> parameter is a filehandle, the compressed data will be written to it. The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output\_filename\_or\_reference> is a scalar reference, the compressed data will be stored in C<\$\$output\_filename\_or\_reference>.

=item An Array  
Reference

If C<\$output\_filename\_or\_reference> is an array reference, the compressed data will be pushed onto the array.

=item An Output FileGlob

If C<\$output\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<zip> will assume that it is an I<output fileglob string>. The output is the list of files that match the fileglob.

When C<\$output\_filename\_or\_reference> is a fileglob string, C<\$input\_filename\_or\_reference> must also be a fileglob string. Anything else is an error.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$output\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

## =head2 Notes

When C<\$input\_filename\_or\_reference> maps to multiple files/buffers and C<\$output\_filename\_or\_reference> is a single file/buffer the input files/buffers will each be stored in C<\$output\_filename\_or\_reference> as a distinct entry.

## =head2 Optional Parameters

Unless specified below, the optional parameters for C<zip>, C<OPTS>, are the same as those used with the OO interface defined in the L</"Constructor Options"> section below.

### =over 5

=item C<< AutoClose => 0|1 >>

This option applies to any input or output data streams to C<zip> that are filehandles.

If C<AutoClose> is specified, and the value is true, it will result in all input and/or output filehandles being closed once C<zip> has completed.

This parameter defaults to 0.

=item C<< BinModeIn => 0|1 >>

When reading from a file or filehandle, set C<binmode> before reading.

Defaults to 0.

=item C<< Append => 0|1 >>

The behaviour of this option is dependent on the type of output data stream.

### =over 5

=item \* A Buffer

If C<Append> is enabled, all compressed data will be append to the end of the output buffer. Otherwise the output buffer will be cleared before any compressed data is written to it.

=item \* A Filename

If C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any compressed data is written to it.

=item \* A Filehandle

If C<Append> is enabled, the filehandle will be positioned to the end of the file via a call to C<seek> before any compressed data is written to it. Otherwise the file pointer will not be moved.

=back

When C<Append> is specified, and set to true, it will I<append> all compressed data to the output data stream.

So when the output is a filehandle it will carry out a seek to the eof before writing any compressed data. If the output is a filename, it will be opened for appending. If the output is a buffer, all compressed data will be appended to the existing buffer.

Conversely when C<Append> is not specified, or it is present and is set to false, it will operate as follows.

When the output is a filename, it will truncate the contents of the file before writing any compressed data. If the output is a filehandle its position will not be changed. If the output is a buffer, it will be wiped before any compressed data is output.

Defaults to 0.

=back

=head2 Examples

To read the contents of the file C<file1.txt> and write the compressed data to the file C<file1.txt.zip>.

```
use strict ;
use warnings ;
use IO::Compress::Zip qw(zip $ZipError) ;

my $input = "file1.txt";
zip $input => "$input.zip"
    or die "zip failed: $ZipError\n";
```

To read from an existing Perl filehandle, C<\$input>, and write the compressed data to a buffer, C<\$buffer>.

```
use strict ;
use warnings ;
use IO::Compress::Zip qw(zip $ZipError) ;
use IO::File ;

my $input = new IO::File "<file1.txt"
    or die "Cannot open 'file1.txt': $!\n" ;
my $buffer ;
zip $input => \$buffer
    or die "zip failed: $ZipError\n";
```

To create a zip file, C<output.zip>, that contains the compressed contents of the files C<alpha.txt> and C<beta.txt>

```
use strict ;
use warnings ;
use IO::Compress::Zip qw(zip $ZipError) ;

zip [ 'alpha.txt', 'beta.txt' ] => 'output.zip'
    or die "zip failed: $ZipError\n";
```

Alternatively, rather than having to explicitly name each of the files that you want to compress, you could use a fileglob to select all the C<txt> files in the current directory, as follows

```
use strict ;
use warnings ;
use IO::Compress::Zip qw(zip $ZipError) ;

my @files = <*.txt>;
zip \@files => 'output.zip'
    or die "zip failed: $ZipError\n";
```

or more succinctly

```
zip [ <*.txt> ] => 'output.zip'
    or die "zip failed: $ZipError\n";
```

=head1 OO Interface

=head2 Constructor

The format of the constructor for C<IO::Compress::Zip> is shown below

```
my $z = new IO::Compress::Zip $output [,OPTS]
```

```
or die "IO::Compress::Zip failed: $ZipError\n";
```

It returns an C<IO::Compress::Zip> object on success and undef on failure.  
The variable C<\$ZipError> will contain an error message on failure.

If you are running Perl 5.005 or better the object, C<\$z>, returned from  
IO::Compress::Zip can be used exactly  
like an L<IO::File|IO::File> filehandle.

This means that all normal output file operations can be carried out  
with C<\$z>.

For example, to write to a compressed file/buffer you can use either of  
these forms

```
$z->print("hello world\n");  
print $z "hello world\n";
```

The mandatory parameter C<\$output> is used to control the destination  
of the compressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output> parameter is a simple scalar, it is assumed to be a  
filename. This file will be opened for writing and the compressed data  
will be written to it.

=item A filehandle

If the C<\$output> parameter is a filehandle, the compressed data will be  
written to it.

The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output> is a scalar reference, the compressed data will be stored  
in C<\$\$output>.

=back

If the C<\$output> parameter is any other type, C<IO::Compress::Zip>::new will  
return undef.

=head2 Constructor  
Options

C<OPTS> is any combination of the following options:

=over 5

=item C<< AutoClose => 0|1 >>

This option is only valid when the C<\$output> parameter is a filehandle. If specified, and the value is true, it will result in the C<\$output> being closed once either the C<close> method is called or the C<IO::Compress::Zip> object is destroyed.

This parameter defaults to 0.

=item C<< Append => 0|1 >>

Opens C<\$output> in append mode.

The behaviour of this option is dependent on the type of C<\$output>.

=over 5

=item \* A Buffer

If C<\$output> is a buffer and C<Append> is enabled, all compressed data will be append to the end of C<\$output>. Otherwise C<\$output> will be cleared before any data is written to it.

=item \* A Filename

If C<\$output> is a filename and C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any compressed data is written to it.

=item \* A Filehandle

If C<\$output> is a filehandle, the file pointer will be positioned to the end of the file via a call to C<seek> before any compressed data is written to it. Otherwise the file pointer will not be moved.

=back

This parameter defaults to 0.

=item C<< Name => \$string >>

Stores the contents of C<\$string> in the zip filename header field.

If C<Name> is not specified and the C<\$input> parameter is a filename, the value of C<\$input> will be used for the zip filename header field.

If C<Name> is not specified and the C<\$input> parameter is not a filename, no zip filename field will be created.

Note that both the C<CanonicalName> and C<FilterName> options can modify the value used for the zip filename header field.

=item C<< CanonicalName => 0|1 >>

This option controls whether the filename field in the zip header is I<normalized> into Unix format before being written to the zip file.

It is recommended that you enable this option unless you really need to create a non-standard Zip file.

This is what APPNOTE.TXT has to say on what should be stored in the zip filename header field.

The name of the file, with optional relative path. The path stored should not contain a drive or device letter, or a leading slash. All slashes should be forward slashes '/' as opposed to backwards slashes '\' for compatibility with Amiga and UNIX file systems etc.

This option defaults to B<false>.

=item C<< FilterName => sub { ... } >>

This option allow the filename field in the zip header to be modified before it is written to the zip file.

This option takes a parameter that must be a reference to a sub. On entry to the sub the C<\$\_> variable will contain the name to be filtered. If no filename is available C<\$\_> will contain an empty string.

The value of C<\$\_> when the sub returns will be stored in the filename header field.

Note that if C<CanonicalName> is enabled, a normalized filename will be passed to the sub.

If you use C<FilterName> to modify the filename, it is your responsibility to keep the filename in Unix format.

Although this option can be used with the OO ointerface, it is of most use

with the one-shot interface. For example, the code below shows how C<FilterName> can be used to remove the path component from a series of filenames before they are stored in C<\$zipfile>.

```
sub compressTxtFiles
{
  my $zipfile = shift ;
  my $dir    = shift ;

  zip [ <$dir/*.txt> ] => $zipfile,
    FilterName => sub { s[^[^$dir/] ] } ;
}
```

=item C<< Time => \$number >>

Sets the last modified time field in the zip header to \$number.

This field defaults to the time the C<IO::Compress::Zip> object was created if this option is not specified and the C<\$input> parameter is not a filename.

=item C<< ExtAttr => \$attr >>

This option controls the "external file attributes" field in the central header of the zip file. This is a 4 byte field.

If you are running a Unix derivative this value defaults to

```
0100644
<< 16
```

This should allow read/write access to any files that are extracted from the zip file/buffer`.

For all other systems it defaults to 0.

=item C<< exTime => [\$atime, \$mtime, \$ctime] >>

This option expects an array reference with exactly three elements: C<\$atime>, C<\$mtime> and C<\$ctime>. These correspond to the last access time, last modification time and creation time respectively.

It uses these values to set the extended timestamp field (ID is "UT") in the local zip header using the three values, \$atime, \$mtime, \$ctime. In addition it sets the extended timestamp field in the central zip header using C<\$mtime>.

If any of the three values is C<undef> that time value will not be used.

So, for example, to set only the C<\$mtime> you would use this

```
exTime => [undef, $mtime, undef]
```

If the C<Minimal> option is set to true, this option will be ignored.

By default no extended time field is created.

```
=item C<< exUnix2 => [$suid, $gid] >>
```

This option expects an array reference with exactly two elements: C<\$suid> and C<\$gid>. These values correspond to the numeric User ID (UID) and Group ID (GID) of the owner of the files respectively.

When the C<exUnix2> option is present it will trigger the creation of a Unix2 extra field (ID is "Ux") in the local zip header. This will be populated with C<\$suid> and C<\$gid>. An empty Unix2 extra field will also be created in the central zip header.

Note - The UID & GID are stored as 16-bit integers in the "Ux" field. Use C<< exUnixN >> if your UID or GID are 32-bit.

If the C<Minimal> option is set to true, this option will be ignored.

By default no Unix2 extra field is created.

```
=item C<< exUnixN => [$suid, $gid] >>
```

This option expects an array reference with exactly two elements: C<\$suid> and C<\$gid>. These values correspond to the numeric User ID (UID) and Group ID (GID) of the owner of the files respectively.

When the C<exUnixN> option is present it will trigger the creation of a UnixN extra field (ID is "ux") in both the local and central zip headers.

This will be populated with C<\$suid> and C<\$gid>.

The UID & GID are stored as 32-bit integers.

If the C<Minimal> option is set to true, this option will be ignored.

By default no UnixN extra field is created.

```
=item C<< Comment => $comment >>
```

Stores the contents of C<\$comment> in the Central File Header of the zip file.

By default, no comment field is written to the zip file.

```
=item C<< ZipComment => $comment >>
```

Stores the contents of C<\$comment> in the End of Central Directory record of the zip file.

By default, no comment field is written to the zip file.

```
=item C<< Method => $method >>
```

Controls which compression method is used. At present four compression methods are supported, namely Store (no compression at all), Deflate, Bzip2 and Lzma.

The symbols, ZIP\_CM\_STORE, ZIP\_CM\_DEFLATE, ZIP\_CM\_BZIP2 and ZIP\_CM\_LZMA are used to select the compression method.

These constants are not imported by C<IO::Compress::Zip> by default.

```
use IO::Compress::Zip
qw(:zip_method);
use IO::Compress::Zip qw(:constants);
use IO::Compress::Zip qw(:all);
```

Note that to create Bzip2 content, the module C<IO::Compress::Bzip2> must be installed. A fatal error will be thrown if you attempt to create Bzip2 content when C<IO::Compress::Bzip2> is not available.

Note that to create Lzma content, the module C<IO::Compress::Lzma> must be installed. A fatal error will be thrown if you attempt to create Lzma content when C<IO::Compress::Lzma> is not available.

The default method is ZIP\_CM\_DEFLATE.

```
=item C<< Stream => 0|1 >>
```

This option controls whether the zip file/buffer output is created in streaming mode.

Note that when outputting to a file with streaming mode disabled (C<Stream> is 0), the output file must be seekable.

The default is 1.

```
=item C<< Zip64 => 0|1 >>
```

Create a Zip64 zip file/buffer. This option is used if you want to store files larger than 4 Gig or store more than 64K files in a single zip archive..

C<Zip64> will be automatically set, as needed, if working with the one-shot interface when the input is either a filename or a scalar reference.

If you intend to manipulate the Zip64 zip files created with this module using an external zip/unzip, make sure that it supports Zip64.

In particular, if you are using Info-Zip you need to have zip version 3.x or better to update a Zip64 archive and unzip version 6.x to read a zip64 archive.

The default is 0.

```
=item C<< TextFlag => 0|1 >>
```

This parameter controls the setting of a bit in the zip central header. It is used to signal that the data stored in the zip file/buffer is probably text.

In one-shot mode this flag will be set to true if the Perl C<-T> operator thinks the file contains text.

The default is 0.

```
=item C<< ExtraFieldLocal => $data >>
```

```
=item C<< ExtraFieldCentral => $data >>
```

The C<ExtraFieldLocal> option is used to store additional metadata in the local header for the zip file/buffer. The C<ExtraFieldCentral> does the same for the matching central header.

An extra field consists of zero or more subfields. Each subfield consists of a two byte header followed by the subfield data.

The list of subfields can be supplied in any of the following formats

```
ExtraFieldLocal => [$id1, $data1,  
                    $id2, $data2,  
                    ...  
                    ]
```

```
ExtraFieldLocal => [ [$id1 => $data1],
```

```
    [$id2 => $data2],  
    ...  
]
```

```
ExtraFieldLocal => { $id1 => $data1,  
    $id2 => $data2,  
    ...  
}
```

Where C<\$id1>, C<\$id2> are two byte subfield ID's.

If you use the hash syntax, you have no control over the order in which the ExtraSubFields are stored, plus you cannot have SubFields with duplicate ID.

Alternatively the list of subfields can be supplied as a scalar, thus

```
ExtraField => $rawdata
```

In this case C<IO::Compress::Zip> will check that C<\$rawdata> consists of zero or more conformant sub-fields.

The Extended Time field (ID "UT"), set using the C<exTime> option, and the Unix2 extra field (ID "Ux"), set using the C<exUnix2> option, are examples of extra fields.

If the C<Minimal> option is set to true, this option will be ignored.

The maximum size of an extra field 65535 bytes.

```
=item C<< Minimal => 1|0 >>
```

If specified, this option will disable the creation of all extra fields in the zip local and central headers. So the C<exTime>, C<exUnix2>, C<exUnixN>, C<ExtraFieldLocal> and C<ExtraFieldCentral> options will be ignored.

This parameter defaults to 0.

```
=item C<< BlockSize100K => number >>
```

Specify the number of 100K blocks bzip2 uses during compression.

Valid values are from 1 to 9, where 9 is best compression.

This option is only valid if the C<Method> is ZIP\_CM\_BZIP2. It is ignored otherwise.

The default is 1.

=item C<< WorkFactor => number >>

Specifies how much effort bzip2 should take before resorting to a slower fallback compression algorithm.

Valid values range from 0 to 250, where 0 means use the default value 30.

This option is only valid if the C<Method> is ZIP\_CM\_BZIP2. It is ignored otherwise.

The default is 0.

=item C<< Preset => number >>

Used to choose the LZMA compression preset.

Valid values are 0-9 and C<LZMA\_PRESET\_DEFAULT>.

0 is the fastest compression with the lowest memory usage and the lowest compression.

9 is the slowest compression with the highest memory usage but with the best compression.

This option is only valid if the C<Method> is ZIP\_CM\_LZMA. It is ignored otherwise.

Defaults to C<LZMA\_PRESET\_DEFAULT> (6).

=item C<< Extreme => 0|1 >>

Makes LZMA compression a lot slower, but a small compression gain.

This option is only valid if the C<Method> is ZIP\_CM\_LZMA. It is ignored otherwise.

Defaults to 0.

=item -Level

Defines the compression level used by zlib. The value should either be a number between 0 and 9 (0 means no compression and 9 is maximum compression),

or one of the symbolic constants defined below.

```
Z_NO_COMPRESSION
Z_BEST_SPEED
Z_BEST_COMPRESSION
Z_DEFAULT_COMPRESSION
```

The default is Z\_DEFAULT\_COMPRESSION.

Note, these constants are not imported by C<IO::Compress::Zip> by default.

```
use IO::Compress::Zip qw(:strategy);
use IO::Compress::Zip qw(:constants);
use IO::Compress::Zip qw(:all);
```

=item -Strategy

Defines the strategy used to tune the compression. Use one of the symbolic constants defined below.

```
Z_FILTERED
Z_HUFFMAN_ONLY
Z_RLE
Z_FIXED
Z_DEFAULT_STRATEGY
```

The default is Z\_DEFAULT\_STRATEGY.

=item C<< Strict => 0|1 >>

This is a placeholder option.

=back

=head2 Examples

TODO

=head1 Methods

=head2 print

Usage is

```
$z->print($data)
print $z $data
```

Compresses and outputs the contents of the C<\$data> parameter. This

has the same behaviour as the C<print> built-in.

Returns true if successful.

=head2 printf

Usage is

```
$z->printf($format, $data)
printf $z $format,
$data
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns true if successful.

=head2 syswrite

Usage is

```
$z->syswrite $data
$z->syswrite $data, $length
$z->syswrite $data, $length, $offset
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns the number of uncompressed bytes written, or C<undef> if unsuccessful.

=head2 write

Usage is

```
$z->write $data
$z->write $data, $length
$z->write $data, $length, $offset
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns the number of uncompressed bytes written, or C<undef> if unsuccessful.

=head2 flush

Usage is

```
$z->flush;
$z->flush($flush_type);
```

Flushes any pending compressed data to the output file/buffer.

This method takes an optional parameter, C<\$flush\_type>, that controls how the flushing will be carried out. By default the C<\$flush\_type> used is C<Z\_FINISH>. Other valid values for C<\$flush\_type> are C<Z\_NO\_FLUSH>, C<Z\_SYNC\_FLUSH>, C<Z\_FULL\_FLUSH> and C<Z\_BLOCK>. It is strongly recommended that you only set the C<flush\_type> parameter if you fully understand the implications of what it does - overuse of C<flush> can seriously degrade the level of compression achieved. See the C<zlib> documentation for details.

Returns true on success.

=head2 tell

Usage is

```
$z->tell()  
tell $z
```

Returns the uncompressed file offset.

=head2 eof

Usage is

```
$z->eof();  
eof($z);
```

Returns true if the C<close> method has been called.

=head2 seek

```
$z->seek($position, $whence);  
seek($z, $position, $whence);
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the output file/buffer.

It is a fatal error to attempt to seek backward.

Empty parts of the file/buffer will have NULL (0x00) bytes written to them.

The C<\$whence> parameter takes one the usual values, namely SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

=head2 binmode

Usage is

```
$z->binmode  
binmode $z ;
```

This is a noop provided for completeness.

=head2 opened

```
$z->opened()
```

Returns true if the object currently refers to a opened file/buffer.

=head2 autoflush

```
my $prev = $z->autoflush()  
my $prev = $z->autoflush(EXPR)
```

If the C<\$z> object is associated with a file or a filehandle, this method returns the current autoflush setting for the underlying filehandle. If C<EXPR> is present, and is non-zero, it will enable flushing after every write/print operation.

If C<\$z> is associated with a buffer, this method has no effect and always returns C<undef>.

B<Note> that the special variable C<\$|> B<cannot> be used to set or retrieve the autoflush setting.

=head2 input\_line\_number

```
$z->input_line_number()  
$z->input_line_number(EXPR)
```

This method always returns C<undef> when compressing.

=head2 fileno

```
$z->fileno()  
fileno($z)
```

If the C<\$z> object is associated with a file or a filehandle, C<fileno> will return the underlying file descriptor.

Once the `C<close>` method is called `C<fileno>` will return `C<undef>`.

If the `C<$z>` object is associated with a buffer, this method will return `C<undef>`.

```
=head2 close
```

```
$z->close() ;  
close $z ;
```

Flushes any pending compressed data and then closes the output file/buffer.

For most versions of Perl this method will be automatically invoked if the `IO::Compress::Zip` object is destroyed (either explicitly or by the variable with the reference to the object going out of scope). The exceptions are Perl versions 5.005 through 5.00504 and 5.8.0. In these cases, the `C<close>` method will be called automatically, but not until global destruction of all live objects when the program is terminating.

Therefore, if you want your scripts to be able to run on all versions of Perl, you should call `C<close>` explicitly and not rely on automatic closing.

Returns true on success, otherwise 0.

If the `C<AutoClose>` option has been enabled when the `IO::Compress::Zip` object was created, and the object is associated with a file, the underlying file will also be closed.

```
=head2 newStream([OPTS])
```

Usage is

```
$z->newStream( [OPTS] )
```

Closes the current compressed data stream and starts a new one.

`OPTS` consists of any of the the options that are available when creating the `C<$z>` object.

See the [L</"Constructor Options">](#) section for more details.

```
=head2 deflateParams
```

Usage is

\$z->deflateParams

TODO

=head1 Importing

A number of symbolic constants are required by some methods in C<IO::Compress::Zip>. None are imported by default.

=over 5

=item :all

Imports C<zip>, C<\$ZipError> and all symbolic constants that can be used by C<IO::Compress::Zip>. Same as doing this

```
use IO::Compress::Zip qw(zip $ZipError :constants) ;
```

=item :constants

Import all symbolic constants. Same as doing this

```
use IO::Compress::Zip qw(:flush :level :strategy :zip_method) ;
```

=item :flush

These symbolic constants are used by the C<flush> method.

```
Z_NO_FLUSH  
Z_PARTIAL_FLUSH  
Z_SYNC_FLUSH  
Z_FULL_FLUSH  
Z_FINISH  
Z_BLOCK
```

=item :level

These symbolic constants are used by the C<Level> option in the constructor.

```
Z_NO_COMPRESSION  
Z_BEST_SPEED  
Z_BEST_COMPRESSION  
Z_DEFAULT_COMPRESSION
```

=item :strategy

These symbolic constants are used by the C<Strategy> option in the constructor.

Z\_FILTERED  
Z\_HUFFMAN\_ONLY  
Z\_RLE  
Z\_FIXED  
Z\_DEFAULT\_STRATEGY

=item :zip\_method

These symbolic constants are used by the C<Method> option in the constructor.

ZIP\_CM\_STORE  
ZIP\_CM\_DEFLATE  
ZIP\_CM\_BZIP2

=head1 NAME

IO::Uncompress::AnyInflate - Uncompress zlib-based (zip, gzip) file/buffer

=head1 SYNOPSIS

```
use IO::Uncompress::AnyInflate qw(anyinflate $AnyInflateError) ;
```

```
my $status = anyinflate $input => $output [,.OPTS]  
    or die "anyinflate failed: $AnyInflateError\n";
```

```
my $z = new IO::Uncompress::AnyInflate $input [OPTS]  
    or die "anyinflate failed: $AnyInflateError\n";
```

```
$status = $z->read($buffer)
```

```
$status = $z->read($buffer, $length)
$status = $z->read($buffer, $length, $offset)
$line = $z->getline()
$char = $z->getc()
$char = $z->ungetc()
$char = $z->opened()
```

```
$status = $z->inflateSync()
```

```
$data = $z->trailingData()
$status = $z->nextStream()
$data = $z->getHeaderInfo()
$z->tell()
$z->seek($position, $whence)
$z->binmode()
$z->fileno()
$z->eof()
$z->close()
```

```
$AnyInflateError ;
```

```
# IO::File mode
```

```
<$z>
read($z,
$buffer);
read($z, $buffer, $length);
read($z, $buffer, $length, $offset);
tell($z)
seek($z, $position, $whence)
binmode($z)
fileno($z)
eof($z)
close($z)
```

```
=head1 DESCRIPTION
```

This module provides a Perl interface that allows the reading of files/buffers that have been compressed in a number of formats that use the zlib compression library.

The formats supported are

```
=over 5
```

```
=item RFC 1950
```

```
=item RFC 1951 (optionally)
```

=item gzip (RFC 1952)

=item zip

=back

The module will auto-detect which, if any, of the supported compression formats is being used.

=head1 Functional Interface

A top-level function, `C<anyinflate>`, is provided to carry out "one-shot" uncompression between buffers and/or files. For finer control over the uncompression process, see the [L<"/OO Interface">](#) section.

```
use IO::Uncompress::AnyInflate qw(anyinflate $AnyInflateError) ;

anyinflate $input_filename_or_reference => $output_filename_or_reference [,OPTS]
    or die
"anyinflate failed: $AnyInflateError\n";
```

The functional interface needs Perl5.005 or better.

=head2 `anyinflate $input_filename_or_reference => $output_filename_or_reference [, OPTS]`

`C<anyinflate>` expects at least two parameters, `C<$input_filename_or_reference>` and `C<$output_filename_or_reference>`.

=head3 The `C<$input_filename_or_reference>` parameter

The parameter, `C<$input_filename_or_reference>`, is used to define the source of the compressed data.

It can take one of the following forms:

=over 5

=item A filename

If the `C<$input_filename_or_reference>` parameter is a simple scalar, it is assumed to be a filename. This file will be opened for reading and the input data will be read from it.

=item A filehandle

If the `C<$input_filename_or_reference>` parameter is a filehandle, the input

data will be read from it. The string '-' can be used as an alias for standard input.

=item A scalar reference

If C<\$input\_filename\_or\_reference> is a scalar reference, the input data will be read from C<\$\$input\_filename\_or\_reference>.

=item An array reference

If C<\$input\_filename\_or\_reference> is an array reference, each element in the array must be a filename.

The input data will be read from each file in turn.

The complete array will be walked to ensure that it only contains valid filenames before any data is uncompressed.

=item An Input FileGlob string

If C<\$input\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<anyinflate> will assume that it is an I<input fileglob string>. The input is the list of files that match the fileglob.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$input\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head3 The C<\$output\_filename\_or\_reference> parameter

The parameter C<\$output\_filename\_or\_reference> is used to control the destination of the uncompressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the

C<\$output\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the uncompressed data will be written to it.

=item A filehandle

If the C<\$output\_filename\_or\_reference> parameter is a filehandle, the uncompressed data will be written to it. The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output\_filename\_or\_reference> is a scalar reference, the uncompressed data will be stored in C<\$\$output\_filename\_or\_reference>.

=item An Array Reference

If C<\$output\_filename\_or\_reference> is an array reference, the uncompressed data will be pushed onto the array.

=item An Output FileGlob

If C<\$output\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<anyinflate> will assume that it is an I<output fileglob string>. The output is the list of files that match the fileglob.

When C<\$output\_filename\_or\_reference> is a fileglob string, C<\$input\_filename\_or\_reference> must also be a fileglob string. Anything else is an error.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$output\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head2 Notes

When C<\$input\_filename\_or\_reference> maps to multiple compressed files/buffers and C<\$output\_filename\_or\_reference> is a single file/buffer, after uncompression C<\$output\_filename\_or\_reference> will contain a concatenation of all the uncompressed data from each of the input files/buffers.

=head2 Optional Parameters

Unless specified below, the optional parameters for C<anyinflate>, C<OPTS>, are the same as those used with the OO interface defined in the L</"Constructor Options"> section below.

=over 5

=item C<< AutoClose => 0|1 >>

This option applies to any input or output data streams to C<anyinflate> that are filehandles.

If C<AutoClose> is specified, and the value is true, it will result in all input and/or output filehandles being closed once C<anyinflate> has completed.

This parameter defaults to 0.

=item C<< BinModeOut => 0|1 >>

When writing to a file or filehandle, set C<binmode> before writing to the file.

Defaults to 0.

=item C<< Append => 0|1 >>

The behaviour of this option is dependent on the type of output data stream.

=over 5

=item \* A Buffer

If C<Append> is enabled, all uncompressed data will be append to the end of the output buffer. Otherwise the output buffer will be cleared before any uncompressed data is written to it.

=item \* A Filename

If C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any uncompressed data is written to it.

=item \* A Filehandle

If C<Append> is enabled, the filehandle will be positioned to the end of the file via a call to C<seek> before any uncompressed data is written to it. Otherwise the file pointer will not be moved.

=back

When C<Append> is specified, and set to true, it will I<append> all uncompressed data to the output data stream.

So when the output is a filehandle it will carry out a seek to the eof before writing any uncompressed data. If the output is a filename, it will be opened for appending. If the output is a buffer, all uncompressed data will be appended to the existing buffer.

Conversely when C<Append> is not specified, or it is present and is set to false, it will operate as follows.

When the output is a filename, it will truncate the contents of the file before writing any uncompressed data. If the output is a filehandle its position will not be changed. If the output is a buffer, it will be wiped before any uncompressed data is output.

Defaults to 0.

=item C<< MultiStream => 0|1 >>

If the input file/buffer contains multiple compressed data streams, this option will uncompress the whole lot as a single data stream.

Defaults to 0.

=item C<< TrailingData => \$scalar >>

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete.

This option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, C<trailingData> will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, C<trailingData> will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using C<trailingData> if the input is a filename.

If you know the length of the compressed data stream before you start

uncompressing, you can avoid having to use `C<trailingData>` by setting the `C<InputLength>` option.

=back

=head2 Examples

To read the contents of the file `C<file1.txt.Compressed>` and write the uncompressed data to the file `C<file1.txt>`.

```
use strict ;
use warnings ;
use IO::Uncompress::AnyInflate qw(anyinflate $AnyInflateError) ;

my $input = "file1.txt.Compressed";
my $output = "file1.txt";
anyinflate $input => $output
    or die "anyinflate failed: $AnyInflateError\n";
```

To read from an existing Perl filehandle, `C<$input>`, and write the uncompressed data to a buffer, `C<$buffer>`.

```
use strict ;
use warnings ;
use IO::Uncompress::AnyInflate qw(anyinflate $AnyInflateError) ;
use IO::File ;

my $input = new IO::File "<file1.txt.Compressed"
    or die "Cannot open 'file1.txt.Compressed': $!\n" ;
my $buffer ;
anyinflate $input => \$buffer
    or die "anyinflate failed: $AnyInflateError\n";
```

To uncompress all files in the directory `"/my/home"` that match `"*.txt.Compressed"` and store the compressed data in the same directory

```
use strict ;
use warnings ;
use IO::Uncompress::AnyInflate qw(anyinflate $AnyInflateError) ;

anyinflate '</my/home/*.txt.Compressed>' => '</my/home/#1.txt>'
    or die "anyinflate failed: $AnyInflateError\n";
```

and if you want to compress each file one at a time, this will do the trick

```
use strict ;
use warnings ;
use IO::Uncompress::AnyInflate qw(anyinflate $AnyInflateError) ;
```

```

for my $input ( glob "/my/home/*.txt.Compressed" )
{
    my $output = $input;
    $output =~ s/.Compressed// ;
    anyinflate $input => $output
        or die "Error compressing '$input': $AnyInflateError\n";
}

```

=head1 OO Interface

=head2 Constructor

The format of the constructor for `IO::Uncompress::AnyInflate` is shown below

```

my $z = new IO::Uncompress::AnyInflate $input [OPTS]
    or die "IO::Uncompress::AnyInflate failed: $AnyInflateError\n";

```

Returns an `C<IO::Uncompress::AnyInflate>` object on success and `undef` on failure.

The variable `C<$AnyInflateError>` will contain an error message on failure.

If you are running Perl 5.005 or better the object, `C<$z>`, returned from

`IO::Uncompress::AnyInflate`

can be used exactly like an `L<IO::File|IO::File>` filehandle.

This means that all normal input file operations can be carried out with `C<$z>`. For example, to read a line from a compressed file/buffer you can use either of these forms

```

$line = $z->getline();
$line = <$z>;

```

The mandatory parameter `C<$input>` is used to determine the source of the compressed data. This parameter can take one of three forms.

=over 5

=item A filename

If the `C<$input>` parameter is a scalar, it is assumed to be a filename. This file will be opened for reading and the compressed data will be read from it.

=item A filehandle

If the `C<$input>` parameter is a filehandle, the compressed data will be read from it.

The string `'-'` can be used as an alias for standard input.

=item A scalar reference

If C<\$input> is a scalar reference, the compressed data will be read from C<\$\$input>.

=back

=head2 Constructor Options

The option names defined below are case insensitive and can be optionally prefixed by a '-'. So all of the following are valid

-AutoClose  
-autoclose  
AUTOCLOSE  
autoclose

OPTS is a combination of the following options:

=over 5

=item C<< AutoClose => 0|1 >>

This option is only valid when the C<\$input> parameter is a filehandle. If specified, and the value is true, it will result in the file being closed once either the C<close> method is called or the IO::Uncompress::AnyInflate object is destroyed.

This parameter defaults to 0.

=item C<< MultiStream => 0|1 >>

Allows multiple concatenated compressed streams to be treated as a single compressed stream. Decompression will stop once either the end of the file/buffer is reached, an error is encountered (premature eof, corrupt compressed data) or the end of a stream is not immediately followed by the start of another stream.

This parameter defaults to 0.

=item C<< Prime => \$string >>

This option will uncompress the contents of C<\$string> before processing the input file/buffer.

This option can be useful when the compressed data is embedded in another file/data structure and it is not possible to work out where the compressed

data begins without having to read the first few bytes. If this is the case, the uncompression can be I<primed> with these bytes using this option.

=item C<< Transparent => 0|1 >>

If this option is set and the input file/buffer is not compressed data, the module will allow reading of it anyway.

In addition, if the input file/buffer does contain compressed data and there is non-compressed data immediately following it, setting this option will make this module treat the whole file/buffer as a single data stream.

This option defaults to 1.

=item C<< BlockSize => \$num >>

When reading the compressed input data, IO::Uncompress::AnyInflate will read it in blocks of C<\$num> bytes.

This option defaults to 4096.

=item C<< InputLength => \$size >>

When present this option will limit the number of compressed bytes read from the input file/buffer to C<\$size>. This option can be used in the situation where there is useful data directly after the compressed data stream and you know beforehand the exact length of the compressed data stream.

This option is mostly used when reading from a filehandle, in which case the file pointer will be left pointing to the first byte directly after the compressed data stream.

This option defaults to off.

=item C<< Append => 0|1 >>

This option controls what the C<read> method does with uncompressed data.

If set to 1, all uncompressed data will be appended to the output parameter of the C<read> method.

If set to 0, the contents of the output parameter of the C<read> method will be overwritten by the uncompressed data.

Defaults to 0.

=item C<< Strict => 0|1 >>

This option controls whether the extra checks defined below are used when carrying out the decompression. When Strict is on, the extra tests are carried out, when Strict is off they are not.

The default for this option is off.

If the input is an RFC 1950 data stream, the following will be checked:

=over 5

=item 1

The ADLER32 checksum field must be present.

=item 2

The value of the ADLER32 field read must match the Adler32 value of the uncompressed data actually contained in the file.

=back

If the input is a gzip (RFC 1952) data stream, the following will be checked:

=over 5

=item 1

If the FHCRC bit is set in the gzip FLG header byte, the CRC16 bytes in the header must match the CRC16 value of the gzip header actually read.

=item 2

If the gzip header contains a name field (FNAME) it consists solely of ISO 8859-1 characters.

=item 3

If the gzip header contains a comment field (FCOMMENT) it consists solely of ISO 8859-1 characters plus line-feed.

=item 4

If the gzip FEXTRA header field is present it must conform to the sub-field structure as defined in RFC 1952.

=item 5

The CRC32 and ISIZE trailer fields must be present.

=item 6

The value of the CRC32 field read must match the crc32 value of the uncompressed data actually contained in the gzip file.

=item 7

The value of the ISIZE fields read must match the length of the uncompressed data actually read from the file.

=back

=item C<< RawInflate => 0|1 >>

When auto-detecting the compressed format, try to test for raw-deflate (RFC 1951) content using the C<IO::Uncompress::RawInflate> module.

The reason this is not default behaviour is because RFC 1951 content can only be detected by attempting to uncompress it. This process is error prone and can result in false positives.

Defaults to 0.

=item C<< ParseExtra => 0|1 >>

If the gzip FEXTRA header field is present and this option is set, it will force the module to check that it conforms to the sub-field structure as defined in RFC 1952.

If the C<Strict> is on it will automatically enable this option.

Defaults to 0.

=back

=head2 Examples

TODO

=head1 Methods

=head2 read

Usage is

```
$status = $z->read($buffer)
```

Reads a block of compressed data (the size the the compressed block is determined by the C<Buffer> option in the constructor), uncompresses it and writes any uncompressed data into C<\$buffer>. If the C<Append> parameter is set in the constructor, the uncompressed data will be appended to the C<\$buffer> parameter. Otherwise C<\$buffer> will be overwritten.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

=head2 read

Usage is

```
$status = $z->read($buffer, $length)
$status = $z->read($buffer, $length, $offset)
```

```
$status = read($z, $buffer, $length)
$status = read($z, $buffer, $length, $offset)
```

Attempt to read C<\$length> bytes of uncompressed data into C<\$buffer>.

The main difference between this form of the C<read> method and the previous one, is that this one will attempt to return I<exactly> C<\$length> bytes. The only circumstances that this function will not is if end-of-file or an IO error is encountered.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

=head2 getline

Usage is

```
$line = $z->getline()
$line = <$z>
```

Reads a single line.

This method fully supports the use of of the variable C<\$/> (or C<\$INPUT\_RECORD\_SEPARATOR> or C<\$RS> when C<English> is in use) to determine what constitutes an end of line. Paragraph mode, record mode and file slurp mode are all supported.

=head2 getc

Usage is

```
$char = $z->getc()
```

Read a single character.

=head2 ungetc

Usage is

```
$char = $z->ungetc($string)
```

=head2 inflateSync

Usage is

```
$status = $z->inflateSync()
```

TODO

=head2 getHeaderInfo

Usage is

```
$hdr = $z->getHeaderInfo();  
@hdrs = $z->getHeaderInfo();
```

This method returns either a hash reference (in scalar context) or a list or hash references (in array context) that contains information about each of the header fields in the compressed data stream(s).

=head2 tell

Usage is

```
$z->tell()  
tell $z
```

Returns the uncompressed file offset.

=head2 eof

Usage is

```
$z->eof();
```

```
eof($z);
```

Returns true if the end of the compressed input stream has been reached.

=head2 seek

```
$z->seek($position, $whence);  
seek($z, $position, $whence);
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the input file/buffer. It is a fatal error to attempt to seek backward.

Note that the implementation of C<seek> in this module does not provide true random access to a compressed file/buffer. It works by uncompressing data from the current offset in the file/buffer until it reaches the uncompressed offset specified in the parameters to C<seek>. For very small files this may be acceptable behaviour. For large files it may cause an unacceptable delay.

The C<\$whence> parameter takes one the usual values, namely SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

=head2 binmode

Usage is

```
$z->binmode  
binmode $z ;
```

This is a noop provided for completeness.

=head2 opened

```
$z->opened()
```

Returns

true if the object currently refers to a opened file/buffer.

=head2 autoflush

```
my $prev = $z->autoflush()  
my $prev = $z->autoflush(EXPR)
```

If the C<\$z> object is associated with a file or a filehandle, this method returns the current autoflush setting for the underlying filehandle. If

C<EXPR> is present, and is non-zero, it will enable flushing after every write/print operation.

If C<\$z> is associated with a buffer, this method has no effect and always returns C<undef>.

B<Note> that the special variable C<\$|> B<cannot> be used to set or retrieve the autoflush setting.

```
=head2 input_line_number
```

```
$z->input_line_number()  
$z->input_line_number(EXPR)
```

Returns the current uncompressed line number. If C<EXPR> is present it has the effect of setting the line number. Note that setting the line number does not change the current position within the file/buffer being read.

The contents of C<\$/> are used to determine what constitutes a line terminator.

```
=head2  
fileno
```

```
$z->fileno()  
fileno($z)
```

If the C<\$z> object is associated with a file or a filehandle, C<fileno> will return the underlying file descriptor. Once the C<close> method is called C<fileno> will return C<undef>.

If the C<\$z> object is associated with a buffer, this method will return C<undef>.

```
=head2 close
```

```
$z->close() ;  
close $z ;
```

Closes the output file/buffer.

For most versions of Perl this method will be automatically invoked if the IO::Uncompress::AnyInflate object is destroyed (either explicitly or by the variable with the reference to the object going out of scope). The exceptions are Perl versions 5.005 through 5.00504 and 5.8.0. In these cases, the C<close> method will be called automatically, but not until global destruction of all live objects when the program is terminating.

Therefore, if you want your scripts to be able to run on all versions of Perl, you should call `C<close>` explicitly and not rely on automatic closing.

Returns true on success,  
otherwise 0.

If the `C<AutoClose>` option has been enabled when the `IO::Uncompress::AnyInflate` object was created, and the object is associated with a file, the underlying file will also be closed.

`=head2 nextStream`

Usage is

```
my $status = $z->nextStream();
```

Skips to the next compressed data stream in the input file/buffer. If a new compressed data stream is found, the eof marker will be cleared and `C<$.>` will be reset to 0.

Returns 1 if a new stream was found, 0 if none was found, and -1 if an error was encountered.

`=head2 trailingData`

Usage is

```
my $data = $z->trailingData();
```

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete. It only makes sense to call this method once the end of the compressed data stream has been encountered.

This option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, `C<trailingData>` will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, `C<trailingData>` will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using `C<trailingData>` if the input is a filename.

If you know the length of the compressed data stream before you start uncompressing, you can avoid having to use `C<trailingData>` by setting the `C<InputLength>` option in the constructor.

=head1 Importing

No symbolic constants are required by this `IO::Uncompress::AnyInflate` at present.

=over 5

=item :all

Imports `C<anyinflate>` and `C<$AnyInflateError>`.

Same as doing this

```
use IO::Uncompress::AnyInflate qw(anyinflate $AnyInflateError) ;
```

=back

=head1 NAME

IO::Compress::Deflate - Write RFC 1950 files/buffers

=head1 SYNOPSIS

```
use IO::Compress::Deflate qw(deflate $DeflateError) ;
```

```
my $status = deflate $input => $output [,OPTS]  
or die "deflate failed: $DeflateError\n";
```

```
my $z = new IO::Compress::Deflate $output [,OPTS]  
or die "deflate failed: $DeflateError\n";
```

```
$z->print($string);
```

```
$z->printf($format, $string);
$z->write($string);
$z->syswrite($string [, $length, $offset]);
$z->flush();
$z->tell();
$z->eof();
$z->seek($position, $whence);
$z->binmode();
$z->fileno();
$z->opened();
$z->autoflush();
$z->input_line_number();
$z->newStream( [OPTS] );
```

```
$z->deflateParams();
```

```
$z->close() ;
```

```
$DeflateError ;
```

```
# IO::File mode
```

```
print $z $string;
printf $z $format, $string;
tell $z
eof $z
seek $z, $position, $whence
binmode $z
fileno
$z
close $z ;
```

## =head1 DESCRIPTION

This module provides a Perl interface that allows writing compressed data to files or buffer as defined in RFC 1950.

For reading RFC 1950 files/buffers, see the companion module [L<IO::Uncompress::Inflate|IO::Uncompress::Inflate>](#).

## =head1 Functional Interface

A top-level function, `C<deflate>`, is provided to carry out "one-shot" compression between buffers and/or files. For finer control over the compression process, see the [L<"/OO Interface">](#) section.

```
use IO::Compress::Deflate qw(deflate $DeflateError) ;
```

```
deflate $input_filename_or_reference => $output_filename_or_reference [,OPTS]  
    or die "deflate failed: $DeflateError\n";
```

The functional interface needs Perl5.005 or better.

```
=head2 deflate $input_filename_or_reference => $output_filename_or_reference [, OPTS]
```

C<deflate> expects at least two parameters,  
C<\$input\_filename\_or\_reference> and C<\$output\_filename\_or\_reference>.

```
=head3 The C<$input_filename_or_reference> parameter
```

The  
parameter, C<\$input\_filename\_or\_reference>, is used to define the  
source of the uncompressed data.

It can take one of the following forms:

```
=over 5
```

```
=item A filename
```

If the C<\$input\_filename\_or\_reference> parameter is a simple scalar, it is  
assumed to be a filename. This file will be opened for reading and the  
input data will be read from it.

```
=item A filehandle
```

If the C<\$input\_filename\_or\_reference> parameter is a filehandle, the input  
data will be read from it. The string '-' can be used as an alias for  
standard input.

```
=item A scalar reference
```

If C<\$input\_filename\_or\_reference> is a scalar reference, the input data  
will be read from C<\$\$input\_filename\_or\_reference>.

```
=item An array reference
```

If C<\$input\_filename\_or\_reference> is an array reference, each element in  
the array must be a filename.

The input data will be read from each file in turn.

The complete array will be walked to ensure that it only  
contains valid filenames before any data is compressed.

=item

An Input FileGlob string

If C<\$input\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<deflate> will assume that it is an I<input fileglob string>. The input is the list of files that match the fileglob.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$input\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head3 The C<\$output\_filename\_or\_reference> parameter

The parameter C<\$output\_filename\_or\_reference> is used to control the destination of the compressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the compressed data will be written to it.

=item A filehandle

If the C<\$output\_filename\_or\_reference> parameter is a filehandle, the compressed data will be written to it. The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output\_filename\_or\_reference> is a scalar reference, the compressed data will be stored in C<\$\$output\_filename\_or\_reference>.

=item An Array Reference

If C<\$output\_filename\_or\_reference> is an array reference, the compressed data will be pushed onto the array.

=item An Output FileGlob

If C<\$output\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<deflate> will assume that it is an I<output fileglob string>. The output is the list of files that match the fileglob.

When C<\$output\_filename\_or\_reference> is an fileglob string, C<\$input\_filename\_or\_reference> must also be a fileglob string. Anything else is an error.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$output\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head2 Notes

When C<\$input\_filename\_or\_reference> maps to multiple files/buffers and C<\$output\_filename\_or\_reference> is a single file/buffer the input files/buffers will be stored in C<\$output\_filename\_or\_reference> as a concatenated series of compressed data streams.

=head2 Optional Parameters

Unless specified below, the optional parameters for C<deflate>, C<OPTS>, are the same as those used with the OO interface defined in the L</"Constructor Options"> section below.

=over 5

=item C<< AutoClose => 0|1 >>

This option applies to any input or output data streams to C<deflate> that are filehandles.

If C<AutoClose> is specified, and the value is true, it will result in all input and/or output filehandles being closed once C<deflate> has completed.

This parameter defaults to 0.

=item C<< BinModeIn => 0|1 >>

When reading from a file or filehandle, set C<binmode> before reading.

Defaults to 0.

=item C<< Append => 0|1 >>

The behaviour of this option is dependent on the type of output data stream.

=over 5

=item \* A Buffer

If C<Append> is enabled, all compressed data will be append to the end of the output buffer. Otherwise the output buffer will be cleared before any compressed data is written to it.

=item \* A Filename

If C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any compressed data is written to it.

=item \* A Filehandle

If C<Append> is enabled, the filehandle will be positioned to the end of the file via a call to C<seek> before any compressed data is written to it. Otherwise the file pointer will not be moved.

=back

When C<Append> is specified, and set to true, it will I<append> all compressed data to the output data stream.

So when the output is a filehandle it will carry out a seek to the eof before writing any compressed data. If the output is a filename, it will be opened for appending. If the output is a buffer, all compressed data will be appended to the existing buffer.

Conversely when C<Append> is not specified, or it is present and is set to false, it will operate as follows.

When the output is a filename, it will truncate the contents of the file before writing any compressed data. If the output is a filehandle its position will not be changed. If the output is a buffer, it will be wiped before any compressed data is output.

Defaults to 0.

=back

=head2 Examples

To read the contents of the file C<file1.txt> and write the compressed data to the file C<file1.txt.1950>.

```
use strict ;
use warnings ;
use IO::Compress::Deflate qw(deflate $DeflateError) ;

my $input = "file1.txt";
deflate $input => "$input.1950"
    or die "deflate failed: $DeflateError\n";
```

To read from an existing Perl filehandle, C<\$input>, and write the compressed data to a buffer, C<\$buffer>.

```
use strict ;
use warnings ;
use IO::Compress::Deflate qw(deflate $DeflateError) ;
use IO::File ;

my $input = new IO::File "<file1.txt"
    or die "Cannot open 'file1.txt': $!\n" ;
my $buffer ;
deflate $input => \$buffer
    or
die "deflate failed: $DeflateError\n";
```

To compress all files in the directory "/my/home" that match "\*.txt" and store the compressed data in the same directory

```
use strict ;
use warnings ;
use IO::Compress::Deflate qw(deflate $DeflateError) ;

deflate '</my/home/*.txt>' => '<*.1950>'
    or die "deflate failed: $DeflateError\n";
```

and if you want to compress each file one at a time, this will do the trick

```
use strict ;
use warnings ;
use IO::Compress::Deflate qw(deflate $DeflateError) ;

for my $input ( glob "/my/home/*.txt" )
```

```

{
    my $output = "$input.1950" ;
    deflate $input => $output
        or die "Error compressing '$input': $DeflateError\n";
}

```

=head1 OO Interface

=head2 Constructor

The format of the constructor for C<IO::Compress::Deflate> is shown below

```

my $z = new IO::Compress::Deflate $output [,OPTS]
    or die "IO::Compress::Deflate failed: $DeflateError\n";

```

It returns an C<IO::Compress::Deflate> object on success and undef on failure.

The variable C<\$DeflateError> will contain an error message on failure.

If you are running Perl 5.005 or better the object, C<\$z>, returned from IO::Compress::Deflate can be used exactly like an L<IO::File|IO::File> filehandle. This means that all normal output file operations can be carried out with C<\$z>.

For example, to write to a compressed file/buffer you can use either of these forms

```

$z->print("hello world\n");
print $z "hello world\n";

```

The mandatory parameter C<\$output> is used to control the destination of the compressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the compressed data will be written to it.

=item A filehandle

If the C<\$output> parameter is a filehandle, the compressed data will be written to it.

The string '-' can be used as an alias for standard output.

=item

A scalar reference

If C<\$output> is a scalar reference, the compressed data will be stored in C<\$\$output>.

=back

If the C<\$output> parameter is any other type, C<IO::Compress::Deflate>::new will return undef.

=head2 Constructor Options

C<OPTS> is any combination of the following options:

=over 5

=item C<< AutoClose => 0|1 >>

This option is only valid when the C<\$output> parameter is a filehandle. If specified, and the value is true, it will result in the C<\$output> being closed once either the C<close> method is called or the C<IO::Compress::Deflate> object is destroyed.

This parameter defaults to 0.

=item C<< Append => 0|1 >>

Opens C<\$output> in append mode.

The behaviour of this option is dependent on the type of C<\$output>.

=over 5

=item \* A Buffer

If C<\$output> is a buffer and C<Append> is enabled, all compressed data will be append to the end of C<\$output>. Otherwise C<\$output> will be cleared before any data is written to it.

=item \* A Filename

If C<\$output> is a filename and C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any compressed data is written to it.

=item \* A Filehandle

If C<\$output> is a filehandle, the file pointer will be positioned to the end of the file via a call to C<seek> before any compressed data is written to it. Otherwise the file pointer will not be moved.

=back

This parameter defaults to 0.

=item C<< Merge => 0|1 >>

This option is used to compress input data and append it to an existing compressed data stream in C<\$output>. The end result is a single compressed data stream stored in C<\$output>.

It is a fatal error to attempt to use this option when C<\$output> is not an RFC 1950 data stream.

There are a number of other limitations with the C<Merge> option:

=over 5

=item 1

This module needs to have been built with zlib 1.2.1 or better to work. A fatal error will be thrown if C<Merge> is used with an older version of zlib.

=item 2

If C<\$output> is a file or a filehandle, it must be seekable.

=back

This parameter defaults to 0.

=item -Level

Defines the compression level used by zlib. The value should either be a number between 0 and 9 (0 means no compression and 9 is maximum compression), or one of the symbolic constants defined below.

Z\_NO\_COMPRESSION  
Z\_BEST\_SPEED  
Z\_BEST\_COMPRESSION  
Z\_DEFAULT\_COMPRESSION

The default is Z\_DEFAULT\_COMPRESSION.

Note, these constants are not imported by C<IO::Compress::Deflate> by default.

```
use IO::Compress::Deflate qw(:strategy);
use IO::Compress::Deflate qw(:constants);
use IO::Compress::Deflate qw(:all);
```

=item -Strategy

Defines the strategy used to tune the compression. Use one of the symbolic constants defined below.

```
Z_FILTERED
Z_HUFFMAN_ONLY
Z_RLE
Z_FIXED
Z_DEFAULT_STRATEGY
```

The default is Z\_DEFAULT\_STRATEGY.

=item C<< Strict => 0|1 >>

This is a placeholder option.

=back

=head2 Examples

TODO

=head1 Methods

=head2 print

Usage is

```
$z->print($data)
print $z $data
```

Compresses and outputs the contents of the C<\$data> parameter. This has the same behaviour as the C<print> built-in.

Returns true if successful.

=head2 printf

Usage is

```
$z->printf($format, $data)
printf $z $format, $data
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns true if successful.

=head2 syswrite

Usage is

```
$z->syswrite $data
$z->syswrite $data, $length
$z->syswrite $data, $length, $offset
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns the number of uncompressed bytes written, or C<undef> if unsuccessful.

=head2 write

Usage is

```
$z->write $data
$z->write $data, $length
$z->write $data, $length, $offset
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns the number of uncompressed bytes written, or C<undef> if unsuccessful.

=head2 flush

Usage is

```
$z->flush;
$z->flush($flush_type);
```

Flushes any pending compressed data to the output file/buffer.

This method takes an optional parameter, C<\$flush\_type>, that controls how the flushing will be carried out. By default the C<\$flush\_type> used is C<Z\_FINISH>. Other valid values for C<\$flush\_type> are C<Z\_NO\_FLUSH>, C<Z\_SYNC\_FLUSH>, C<Z\_FULL\_FLUSH> and C<Z\_BLOCK>. It is

strongly recommended that you only set the C<flush\_type> parameter if you fully understand the implications of what it does - overuse of C<flush> can seriously degrade the level of compression achieved. See the C<zlib> documentation for details.

Returns true on success.

=head2 tell

Usage is

```
$z->tell()
tell $z
```

Returns the uncompressed file offset.

=head2 eof

Usage is

```
$z->eof();
eof($z);
```

Returns true if the C<close> method has been called.

=head2 seek

```
$z->seek($position, $whence);
seek($z, $position, $whence);
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the output file/buffer.

It

is a fatal error to attempt to seek backward.

Empty parts of the file/buffer will have NULL (0x00) bytes written to them.

The C<\$whence> parameter takes one the usual values, namely SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

=head2 binmode

Usage is

```
$z->binmode
binmode $z ;
```

This is a noop provided for completeness.

```
=head2 opened
```

```
$z->opened()
```

Returns true if the object currently refers to a opened file/buffer.

```
=head2 autoflush
```

```
my $prev = $z->autoflush()  
my $prev = $z->autoflush(EXPR)
```

If the C<\$z> object is associated with a file or a filehandle, this method returns the current autoflush setting for the underlying filehandle. If C<EXPR> is present, and is non-zero, it will enable flushing after every write/print operation.

If C<\$z> is associated with a buffer, this method has no effect and always returns C<undef>.

B<Note> that the special variable C<\$|> B<cannot> be used to set or retrieve the autoflush setting.

```
=head2  
input_line_number
```

```
$z->input_line_number()  
$z->input_line_number(EXPR)
```

This method always returns C<undef> when compressing.

```
=head2 fileno
```

```
$z->fileno()  
fileno($z)
```

If the C<\$z> object is associated with a file or a filehandle, C<fileno> will return the underlying file descriptor. Once the C<close> method is called C<fileno> will return C<undef>.

If the C<\$z> object is associated with a buffer, this method will return C<undef>.

```
=head2 close
```

```
$z->close() ;
```

```
close $z ;
```

Flushes any pending compressed data and then closes the output file/buffer.

For most versions of Perl this method will be automatically invoked if the `IO::Compress::Deflate` object is destroyed (either explicitly or by the variable with the reference to the object going out of scope). The exceptions are Perl versions 5.005 through 5.00504 and 5.8.0. In these cases, the `C<close>` method will be called automatically, but not until global destruction of all live objects when the program is terminating.

Therefore,  
if you want your scripts to be able to run on all versions of Perl, you should call `C<close>` explicitly and not rely on automatic closing.

Returns true on success, otherwise 0.

If the `C<AutoClose>` option has been enabled when the `IO::Compress::Deflate` object was created, and the object is associated with a file, the underlying file will also be closed.

```
=head2 newStream([OPTS])
```

Usage is

```
$z->newStream( [OPTS] )
```

Closes the current compressed data stream and starts a new one.

`OPTS` consists of any of the the options that are available when creating the `C<$z>` object.

See the [L<"/"Constructor Options">](#) section for more details.

```
=head2 deflateParams
```

Usage is

```
$z->deflateParams
```

TODO

```
=head1 Importing
```

A number of symbolic constants are required by some methods in `C<IO::Compress::Deflate>`. None are imported by default.

=over 5

=item :all

Imports C<deflate>, C<\$DeflateError> and all symbolic constants that can be used by C<IO::Compress::Deflate>. Same as doing this

```
use IO::Compress::Deflate qw(deflate $DeflateError :constants) ;
```

=item :constants

Import all symbolic constants. Same as doing this

```
use IO::Compress::Deflate qw(:flush :level :strategy) ;
```

=item :flush

These symbolic constants are used by the C<flush> method.

```
Z_NO_FLUSH  
Z_PARTIAL_FLUSH  
Z_SYNC_FLUSH  
Z_FULL_FLUSH  
Z_FINISH  
Z_BLOCK
```

=item :level

These symbolic constants are used by the C<Level> option in the constructor.

```
Z_NO_COMPRESSION  
Z_BEST_SPEED  
Z_BEST_COMPRESSION  
Z_DEFAULT_COMPRESSION
```

=item :strategy

These symbolic constants are used by the C<Strategy> option in the constructor.

```
Z_FILTERED  
Z_HUFFMAN_ONLY  
Z_RLE  
Z_FIXED  
Z_DEFAULT_STRATEGY
```

=head1 NAME

IO::Uncompress::Gunzip - Read RFC 1952 files/buffers

=head1 SYNOPSIS

```
use IO::Uncompress::Gunzip qw(gunzip $GunzipError) ;
```

```
my $status = gunzip $input => $output [,OPTS]  
    or die "gunzip failed: $GunzipError\n";
```

```
my $z = new IO::Uncompress::Gunzip $input [OPTS]  
    or die "gunzip failed: $GunzipError\n";
```

```
$status = $z->read($buffer)  
$status = $z->read($buffer, $length)  
$status = $z->read($buffer, $length, $offset)  
$line = $z->getline()  
$char = $z->getc()  
$char = $z->ungetc()  
$char = $z->opened()
```

```
$status = $z->inflateSync()
```

```
$data = $z->trailingData()  
$status = $z->nextStream()  
$data = $z->getHeaderInfo()  
$z->tell()  
$z->seek($position, $whence)  
$z->binmode()  
$z->fileno()  
$z->eof()
```

```
$z->close()
```

```
$GunzipError ;
```

```
# IO::File mode
```

```
<$z>
```

```
read($z, $buffer);
```

```
read($z, $buffer, $length);
```

```
read($z, $buffer,
```

```
$length, $offset);
```

```
tell($z)
```

```
seek($z, $position, $whence)
```

```
binmode($z)
```

```
fileno($z)
```

```
eof($z)
```

```
close($z)
```

=head1 DESCRIPTION

This module provides a Perl interface that allows the reading of files/buffers that conform to RFC 1952.

For writing RFC 1952 files/buffers, see the companion module `IO::Compress::Gzip`.

=head1 Functional Interface

A top-level function, `C<gunzip>`, is provided to carry out "one-shot" uncompression between buffers and/or files. For finer control over the uncompression process, see the [L<"OO Interface">](#) section.

```
use IO::Uncompress::Gunzip qw(gunzip $GunzipError) ;
```

```
gunzip $input_filename_or_reference => $output_filename_or_reference [,OPTS]  
or die "gunzip failed: $GunzipError\n";
```

The functional interface needs Perl5.005 or better.

```
=head2 gunzip $input_filename_or_reference => $output_filename_or_reference [, OPTS]
```

`C<gunzip>` expects at least two parameters, `C<$input_filename_or_reference>` and `C<$output_filename_or_reference>`.

=head3

The `C<$input_filename_or_reference>` parameter

The parameter, `C<$input_filename_or_reference>`, is used to define the

source of the compressed data.

It can take one of the following forms:

=over 5

=item A filename

If the `<$input_filename_or_reference>` parameter is a simple scalar, it is assumed to be a filename. This file will be opened for reading and the input data will be read from it.

=item A filehandle

If the `C<$input_filename_or_reference>` parameter is a filehandle, the input data will be read from it. The string '-' can be used as an alias for standard input.

=item A scalar reference

If `C<$input_filename_or_reference>` is a scalar reference, the input data will be read from `C<$$input_filename_or_reference>`.

=item An array reference

If `C<$input_filename_or_reference>` is an array reference, each element in the array must be a filename.

The input data will be read from each file in turn.

The complete array will be walked to ensure that it only contains valid filenames before any data is uncompressed.

=item An Input FileGlob string

If `C<$input_filename_or_reference>` is a string that is delimited by the characters "<" and ">" `C<gunzip>` will assume that it is an `I<input fileglob string>`. The input is the list of files that match the fileglob.

See `L<File::GlobMapper|File::GlobMapper>` for more details.

=back

If the `C<$input_filename_or_reference>` parameter is any other type, `C<undef>` will be returned.

=head3 The C<\$output\_filename\_or\_reference> parameter

The parameter C<\$output\_filename\_or\_reference> is used to control the destination of the uncompressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the uncompressed data will be written to it.

=item A filehandle

If the C<\$output\_filename\_or\_reference> parameter is a filehandle, the uncompressed data will be written to it. The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output\_filename\_or\_reference> is a scalar reference, the uncompressed data will be stored in C<\$\$output\_filename\_or\_reference>.

=item An Array Reference

If C<\$output\_filename\_or\_reference> is an array reference, the uncompressed data will be pushed onto the array.

=item An Output FileGlob

If C<\$output\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<gunzip> will assume that it is an I<output fileglob string>. The output is the list of files that match the fileglob.

When C<\$output\_filename\_or\_reference> is an fileglob string, C<\$input\_filename\_or\_reference> must also be a fileglob string. Anything else is an error.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$output\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head2 Notes

When C<\$input\_filename\_or\_reference> maps to multiple compressed files/buffers and C<\$output\_filename\_or\_reference> is a single file/buffer, after uncompression C<\$output\_filename\_or\_reference> will contain a concatenation of all the uncompressed data from each of the input files/buffers.

=head2 Optional Parameters

Unless specified below, the optional parameters for C<gunzip>, C<OPTS>, are the same as those used with the OO interface defined in the L</"Constructor Options"> section below.

=over 5

=item C<< AutoClose => 0|1 >>

This option applies to any input or output data streams to C<gunzip> that are filehandles.

If C<AutoClose> is specified, and the value is true, it will result in all input and/or output filehandles being closed once C<gunzip> has completed.

This parameter defaults to 0.

=item C<< BinModeOut => 0|1 >>

When writing to a file or filehandle, set C<binmode> before writing to the file.

Defaults to 0.

=item C<< Append => 0|1 >>

The behaviour of this option is dependent on the type of output data stream.

=over

5

=item \* A Buffer

If C<Append> is enabled, all uncompressed data will be append to the end of the output buffer. Otherwise the output buffer will be cleared before any

uncompressed data is written to it.

=item \* A Filename

If C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any uncompressed data is written to it.

=item \* A Filehandle

If C<Append> is enabled, the filehandle will be positioned to the end of the file via a call to C<seek> before any uncompressed data is written to it. Otherwise the file pointer will not be moved.

=back

When C<Append> is specified, and set to true, it will I<append> all uncompressed data to the output data stream.

So when the output is a filehandle it will carry out a seek to the eof before writing any uncompressed data. If the output is a filename, it will be opened for appending. If the output is a buffer, all uncompressed data will be appended to the existing buffer.

Conversely when C<Append> is not specified, or it is present and is set to false, it will operate as follows.

When the output is a filename, it will truncate the contents of the file before writing any uncompressed data. If the output is a filehandle its position will not be changed. If the output is a buffer, it will be wiped before any uncompressed data is output.

Defaults to 0.

=item C<< MultiStream => 0|1 >>

If the input file/buffer contains multiple compressed data streams, this option will uncompress the whole lot as a single data stream.

Defaults to 0.

=item C<< TrailingData => \$scalar >>

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete.

This option can be used when there is useful information immediately

following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, `C<trailingData>` will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, `C<trailingData>` will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using `C<trailingData>` if the input is a filename.

If you know the length of the compressed data stream before you start uncompressing, you can avoid having to use `C<trailingData>` by setting the `C<InputLength>` option.

=back

=head2 Examples

To read the contents of the file `C<file1.txt.gz>` and write the uncompressed data to the file `C<file1.txt>`.

```
use strict ;
use warnings ;
use IO::Uncompress::Gunzip qw(gunzip $GunzipError) ;
```

```
my $input = "file1.txt.gz";
my $output = "file1.txt";
gunzip $input => $output
  or die "gunzip failed: $GunzipError\n";
```

To read from an existing Perl filehandle, `C<$input>`, and write the uncompressed data to a buffer, `C<$buffer>`.

```
use strict ;
use warnings ;
use IO::Uncompress::Gunzip qw(gunzip $GunzipError) ;
use IO::File ;
```

```
my $input = new IO::File "<file1.txt.gz"
  or die "Cannot open 'file1.txt.gz': $!\n" ;
my $buffer ;
gunzip $input => \$buffer
  or die "gunzip failed: $GunzipError\n";
```

To uncompress all files in the directory "/my/home" that match "\*.txt.gz" and store the compressed data in the same directory

```
use strict ;
use warnings ;
use IO::Uncompress::Gunzip qw(gunzip $GunzipError) ;

gunzip '</my/home/*.txt.gz' => '</my/home/#1.txt>'
  or die "gunzip failed: $GunzipError\n";
```

and if you want to compress each file one at a time, this will do the trick

```
use strict ;
use warnings ;
use IO::Uncompress::Gunzip qw(gunzip $GunzipError) ;

for my $input ( glob "/my/home/*.txt.gz" )
{
  my $output = $input;
  $output =~ s/.gz// ;
  gunzip $input => $output
    or die "Error compressing '$input':
$GunzipError\n";
}
```

=head1 OO Interface

=head2 Constructor

The format of the constructor for IO::Uncompress::Gunzip is shown below

```
my $z = new IO::Uncompress::Gunzip $input [OPTS]
  or die "IO::Uncompress::Gunzip failed: $GunzipError\n";
```

Returns an C<IO::Uncompress::Gunzip> object on success and undef on failure.

The variable C<\$GunzipError> will contain an error message on failure.

If you are running Perl 5.005 or better the object, C<\$z>, returned from IO::Uncompress::Gunzip can be used exactly like an L<IO::File|IO::File> filehandle.

This means that all normal input file operations can be carried out with C<\$z>. For example, to read a line from a compressed file/buffer you can use either of these forms

```
$line = $z->getline();
$line = <$z>;
```

The mandatory parameter C<\$input> is used to determine the source of the compressed data. This parameter can take one of three forms.

=over 5

=item A filename

If the C<\$input> parameter is a scalar, it is assumed to be a filename. This file will be opened for reading and the compressed data will be read from it.

=item A filehandle

If the C<\$input> parameter is a filehandle, the compressed data will be read from it.

The string '-' can be used as an alias for standard input.

=item A scalar reference

If C<\$input> is a scalar reference, the compressed data will be read from C<\$\$input>.

=back

=head2 Constructor Options

The option names defined below are case insensitive and can be optionally prefixed by a '!'. So all of the following are valid

-AutoClose  
-autoclose  
AUTOCLOSE  
autoclose

OPTS is a combination of the following options:

=over 5

=item C<< AutoClose => 0|1 >>

This option is only valid when the C<\$input> parameter is a filehandle. If specified, and the value is true, it will result in the file being closed once either the C<close> method is called or the IO::Uncompress::Gunzip object is destroyed.

This parameter defaults to 0.

=item C<< MultiStream => 0|1 >>

Allows

multiple concatenated compressed streams to be treated as a single compressed stream. Decompression will stop once either the end of the file/buffer is reached, an error is encountered (premature eof, corrupt compressed data) or the end of a stream is not immediately followed by the start of another stream.

This parameter defaults to 0.

=item C<< Prime => \$string >>

This option will uncompress the contents of C<\$string> before processing the input file/buffer.

This option can be useful when the compressed data is embedded in another file/data structure and it is not possible to work out where the compressed data begins without having to read the first few bytes. If this is the case, the uncompression can be I<primed> with these bytes using this option.

=item C<< Transparent => 0|1 >>

If this option is set and the input file/buffer is not compressed data, the module will allow reading of it anyway.

In addition, if the input file/buffer does contain compressed data and there is non-compressed data immediately following it, setting this option will make this module treat the whole file/buffer as a single data stream.

This option defaults to 1.

=item C<< BlockSize => \$num >>

When reading the compressed input data, IO::Uncompress::Gunzip will read it in blocks of C<\$num> bytes.

This option defaults to 4096.

=item C<< InputLength => \$size >>

When present this option will limit the number of compressed bytes read from the input file/buffer to C<\$size>. This option can be used in the situation where there is useful data directly after the compressed data stream and you know beforehand the exact length of the compressed data stream.

This option is mostly used when reading from a filehandle, in which case the file pointer will be left pointing to the first byte directly after the

compressed data stream.

This option defaults to off.

=item C<< Append => 0|1 >>

This option controls what the C<read> method does with uncompressed data.

If set to 1, all uncompressed data will be appended to the output parameter of the C<read> method.

If set to 0, the contents of the output parameter of the C<read> method will be overwritten by the uncompressed data.

Defaults to 0.

=item C<< Strict => 0|1 >>

This option controls whether the extra checks defined below are used when carrying out the decompression. When Strict is on, the extra tests are carried out, when Strict is off they are not.

The default for this option is off.

=over 5

=item 1

If the FHCRC bit is set in the gzip FLG header byte, the CRC16 bytes in the header must match the crc16 value of the gzip header actually read.

=item 2

If the gzip header contains a name field (FNAME) it consists solely of ISO 8859-1 characters.

=item 3

If the gzip header contains a comment field (FCOMMENT) it consists solely of ISO 8859-1 characters plus line-feed.

=item 4

If the gzip FEXTRA header field is present it must conform to the sub-field structure as defined in RFC 1952.

=item 5

The  
CRC32 and ISIZE trailer fields must be present.

=item 6

The value of the CRC32 field read must match the crc32 value of the uncompressed data actually contained in the gzip file.

=item 7

The value of the ISIZE fields read must match the length of the uncompressed data actually read from the file.

=back

=item C<< ParseExtra => 0|1 >>

If the gzip FEXTRA header field is present and this option is set, it will force the module to check that it conforms to the sub-field structure as defined in RFC 1952.

If the C<Strict> is on it will automatically enable this option.

Defaults to 0.

=back

=head2 Examples

TODO

=head1 Methods

=head2 read

Usage is

```
$status = $z->read($buffer)
```

Reads a block of compressed data (the size the the compressed block is determined by the C<Buffer> option in the constructor), uncompresses it and writes any uncompressed data into C<\$buffer>. If the C<Append> parameter is set in the constructor, the uncompressed data will be appended to the C<\$buffer> parameter. Otherwise C<\$buffer> will be overwritten.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

=head2 read

Usage is

```
$status = $z->read($buffer, $length)
$status = $z->read($buffer, $length, $offset)
```

```
$status = read($z, $buffer, $length)
$status = read($z, $buffer, $length, $offset)
```

Attempt to read C<\$length> bytes of uncompressed data into C<\$buffer>.

The main difference between this form of the C<read> method and the previous one, is that this one will attempt to return I<exactly> C<\$length> bytes. The only circumstances that this function will not is if end-of-file or an IO error is encountered.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

=head2 getline

Usage is

```
$line = $z->getline()
$line = <$z>
```

Reads a single line.

This method fully supports the use of of the variable C<\$/> (or C<\$INPUT\_RECORD\_SEPARATOR> or C<\$RS> when C<English> is in use) to determine what constitutes an end of line. Paragraph mode, record mode and file slurp mode are all supported.

=head2 getc

Usage is

```
$char = $z->getc()
```

Read a single character.

=head2 ungetc

Usage is

```
$char = $z->ungetc($string)
```

```
=head2 inflateSync
```

Usage is

```
$status = $z->inflateSync()
```

```
TODO
```

```
=head2 getHeaderInfo
```

Usage is

```
$hdr = $z->getHeaderInfo();  
@hdrs = $z->getHeaderInfo();
```

This method returns either a hash reference (in scalar context) or a list or hash references (in array context) that contains information about each of the header fields in the compressed data stream(s).

```
=over 5
```

```
=item Name
```

The contents of the Name header field, if present. If no name is present, the value will be undef. Note this is different from a zero length name, which will return an empty string.

```
=item Comment
```

The contents of the Comment header field, if present. If no comment is present, the value will be undef. Note this is different from a zero length comment, which will return an empty string.

```
=back
```

```
=head2 tell
```

Usage is

```
$z->tell()  
tell $z
```

Returns the uncompressed file offset.

```
=head2 eof
```

Usage is

```
$z->eof();  
eof($z);
```

Returns true if the end of the compressed input stream has been reached.

=head2 seek

```
$z->seek($position, $whence);  
seek($z, $position, $whence);
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the input file/buffer. It is a fatal error to attempt to seek backward.

Note that the implementation of C<seek> in this module does not provide true random access to a compressed file/buffer. It works by uncompressing data from the current offset in the file/buffer until it reaches the uncompressed offset specified in the parameters to C<seek>. For very small files this may be acceptable behaviour. For large files it may cause an unacceptable delay.

The C<\$whence> parameter takes one the usual values, namely SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

=head2 binmode

Usage is

```
$z->binmode  
binmode $z ;
```

This is a noop provided for completeness.

=head2 opened

```
$z->opened()
```

Returns true if the object currently refers to a opened file/buffer.

=head2 autoflush

```
my $prev = $z->autoflush()
```

```
my $prev = $z->autoflush(EXPR)
```

If the C<\$z> object is associated with a file or a filehandle, this method returns the current autoflush setting for the underlying filehandle. If C<EXPR> is present, and is non-zero, it will enable flushing after every write/print operation.

If C<\$z> is associated with a buffer, this method has no effect and always returns C<undef>.

B<Note> that the special variable C<\$|> B<cannot> be used to set or retrieve the autoflush setting.

```
=head2 input_line_number
```

```
$z->input_line_number()  
$z->input_line_number(EXPR)
```

Returns the current uncompressed line number. If C<EXPR> is present it has the effect of setting the line number. Note that setting the line number does not change the current position within the file/buffer being read.

The contents of C<\$|> are used to determine what constitutes a line terminator.

```
=head2 fileno
```

```
$z->fileno()  
fileno($z)
```

If the C<\$z> object is associated with a file or a filehandle, C<fileno> will return the underlying file descriptor. Once the C<close> method is called C<fileno> will return C<undef>.

If the C<\$z> object is associated with a buffer, this method will return C<undef>.

```
=head2 close
```

```
$z->close();  
close $z;
```

Closes the output file/buffer.

For most versions of Perl this method will be automatically invoked if the IO::Uncompress::Gunzip object is destroyed (either explicitly or by the variable with the reference to the object going out of scope). The

exceptions are Perl versions 5.005 through 5.00504 and 5.8.0. In these cases, the `C<close>` method will be called automatically, but not until global destruction of all live objects when the program is terminating.

Therefore,  
if you want your scripts to be able to run on all versions of Perl, you should call `C<close>` explicitly and not rely on automatic closing.

Returns true on success, otherwise 0.

If the `C<AutoClose>` option has been enabled when the `IO::Uncompress::Gunzip` object was created, and the object is associated with a file, the underlying file will also be closed.

`=head2 nextStream`

Usage is

```
my $status = $z->nextStream();
```

Skips to the next compressed data stream in the input file/buffer. If a new compressed data stream is found, the eof marker will be cleared and `C<$.>` will be reset to 0.

Returns 1 if a new stream was found, 0 if none was found, and -1 if an error was encountered.

`=head2 trailingData`

Usage is

```
my $data = $z->trailingData();
```

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete. It only makes sense to call this method once the end of the compressed data stream has been encountered.

This  
option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, `C<trailingData>` will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, `C<trailingData>` will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using `C<trailingData>` if the input is a filename.

If you know the length of the compressed data stream before you start uncompressing, you can avoid having to use `C<trailingData>` by setting the `C<InputLength>` option in the constructor.

=head1 Importing

No symbolic constants are required by this `IO::Uncompress::Gunzip` at present.

=over 5

=item :all

Imports `C<gunzip>` and `C<$GunzipError>`.

Same as doing this

```
use IO::Uncompress::Gunzip
qw(gunzip $GunzipError) ;
```

=back

IO-Compress

Version 2.061

19th May 2013

Copyright (c) 1995-2013 Paul Marquess. All rights reserved.

This program is free software; you can redistribute it  
and/or modify it under the same terms as Perl itself.

## DESCRIPTION

-----

This distribution provides a Perl interface to allow reading and writing of compressed data created with the zlib and bzip2 libraries.

IO-Compress supports reading and writing of bzip2, RFC 1950, RFC 1951, RFC 1952 (i.e. gzip) and zip files/buffers.

The following modules used to be distributed separately, but are now included with the IO-Compress distribution.

Compress-Zlib

IO-Compress-Zlib

IO-Compress-Bzip2

IO-Compress-Base

## PREREQUISITES

-----

Before you can build IO-Compress you need to have the following installed on your system:

- \* Perl 5.006 or better.
- \* Compress::Raw::Zlib
- \* Compress::Raw::Bzip2

## BUILDING THE MODULE

-----

Assuming you have met all the prerequisites, the module can now be built using this sequence of commands:

```
perl Makefile.PL
make
make test
```

## INSTALLATION

-----

To install IO-Compress, run the command below:

```
make install
```

## TROUBLESHOOTING

-----

## FEEDBACK

-----

How to report a problem with IO-Compress.

To help me help you, I need all of the following information:

1. The Versions of everything relevant.

This includes:

a. The *\*complete\** output from running this

```
perl -V
```

Do not edit the output in any way.

Note, I want you to run "perl -V" and NOT "perl -v".

If your perl does not understand the "-V" option it is too old. This module needs Perl version 5.004 or better.

b. The version of IO-Compress you have.

If you have successfully installed IO-Compress, this one-liner will tell you:

```
perl -MIO::Compress::Gzip -e 'print qq[ver $IO::Compress::Gzip::VERSION\n]'
```

If you are running windows use this

```
perl -MIO::Compress::Gzip -e "print qq[ver $IO::Compress::Gzip::VERSION\n]"
```

If you haven't installed IO-Compress then search IO::Compress::Gzip.pm for a line like this:

```
$VERSION = "2.061" ;
```

2. If you are having problems building IO-Compress, send me a complete log of what happened. Start by unpacking the IO-Compress module into a fresh directory and keep a log of all the steps

```
[edit config.in, if necessary]
perl Makefile.PL
make
make test TEST_VERBOSE=1
```

=head1 NAME

IO::Uncompress::Bunzip2 - Read bzip2 files/buffers

=head1 SYNOPSIS

```
use IO::Uncompress::Bunzip2 qw(bunzip2 $Bunzip2Error) ;
```

```
my $status = bunzip2 $input => $output [,OPTS]
    or die "bunzip2 failed: $Bunzip2Error\n";
```

```
my $z = new IO::Uncompress::Bunzip2 $input [OPTS]
    or die "bunzip2 failed: $Bunzip2Error\n";
```

```
$status = $z->read($buffer)
$status = $z->read($buffer, $length)
$status = $z->read($buffer, $length, $offset)
```

```
$line = $z->getline()
$char = $z->getc()
$char = $z->ungetc()
$char = $z->opened()

$data = $z->trailingData()
$status = $z->nextStream()
$data = $z->getHeaderInfo()
$z->tell()
$z->seek($position, $whence)
$z->binmode()
$z->fileno()
$z->eof()
$z->close()
```

```
$Bunzip2Error ;
```

```
# IO::File mode
```

```
<$z>
read($z, $buffer);
read($z, $buffer, $length);
read($z, $buffer, $length, $offset);
tell($z)
seek($z, $position, $whence)
binmode($z)
fileno($z)
eof($z)
close($z)
```

```
=head1 DESCRIPTION
```

This module provides a Perl interface that allows the reading of bzip2 files/buffers.

For writing bzip2 files/buffers, see the companion module `IO::Compress::Bzip2`.

```
=head1 Functional Interface
```

A top-level function, `C<bunzip2>`, is provided to carry out "one-shot" uncompression between buffers and/or files. For finer control over the uncompression process, see the [L<"OO Interface">](#) section.

```
use IO::Uncompress::Bunzip2 qw(bunzip2 $Bunzip2Error) ;
```

```
bunzip2 $input => $output [,OPTS]
    or die "bunzip2 failed: $Bunzip2Error\n";
```

The functional interface needs Perl5.005 or better.

```
=head2 bunzip2 $input => $output [, OPTS]
```

C<bunzip2> expects at least two parameters, C<\$input> and C<\$output>.

```
=head3 The C<$input> parameter
```

The parameter, C<\$input>, is used to define the source of the compressed data.

It can take one of the following forms:

```
=over 5
```

```
=item
```

A filename

If the C<\$input> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for reading and the input data will be read from it.

```
=item A filehandle
```

If the C<\$input> parameter is a filehandle, the input data will be read from it.

The string '-' can be used as an alias for standard input.

```
=item A scalar reference
```

If C<\$input> is a scalar reference, the input data will be read from C<\$\$input>.

```
=item An array reference
```

If C<\$input> is an array reference, each element in the array must be a filename.

The input data will be read from each file in turn.

The complete array will be walked to ensure that it only contains valid filenames before any data is uncompressed.

```
=item An Input FileGlob string
```

If C<\$input> is a string that is delimited by the characters "<" and ">" C<bunzip2> will assume that it is an I<input fileglob string>. The

input is the list of files that match the fileglob.

If the fileglob does not match any files ...

See

L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$input> parameter is any other type, C<undef> will be returned.

=head3 The C<\$output> parameter

The parameter C<\$output> is used to control the destination of the uncompressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the uncompressed data will be written to it.

=item A filehandle

If the C<\$output> parameter is a filehandle, the uncompressed data will be written to it.

The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output> is a scalar reference, the uncompressed data will be stored in C<\$\$output>.

=item An Array Reference

If C<\$output> is an array reference, the uncompressed data will be pushed onto the array.

=item An Output FileGlob

If C<\$output> is a string that is delimited by the characters "<" and ">"

C<bunzip2> will assume that it is an I<output fileglob string>. The output is the list of files that match the fileglob.

When C<\$output> is a fileglob string, C<\$input> must also be a fileglob

string. Anything else is an error.

=back

If the C<\$output> parameter is any other type, C<undef> will be returned.

=head2 Notes

When C<\$input> maps to multiple compressed files/buffers and C<\$output> is a single file/buffer, after uncompression C<\$output> will contain a concatenation of all the uncompressed data from each of the input files/buffers.

=head2 Optional Parameters

Unless specified below, the optional parameters for C<bunzip2>, C<OPTS>, are the same as those used with the OO interface defined in the L</"Constructor Options"> section below.

=over 5

=item C<< AutoClose => 0|1 >>

This option applies to any input or output data streams to C<bunzip2> that are filehandles.

If C<AutoClose> is specified, and the value is true, it will result in all input and/or output filehandles being closed once C<bunzip2> has completed.

This parameter defaults to 0.

=item C<< BinModeOut => 0|1 >>

When writing to a file or filehandle, set C<binmode> before writing to the file.

Defaults to 0.

=item C<< Append => 0|1 >>

TODO

=item C<< MultiStream => 0|1 >>

If the input file/buffer contains multiple compressed data streams, this option will uncompress the whole lot as a single data stream.

Defaults to 0.

```
=item C<< TrailingData => $scalar >>
```

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete.

This option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, C<trailingData> will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, C<trailingData> will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using C<trailingData> if the input is a filename.

If you know the length of the compressed data stream before you start uncompressing, you can avoid having to use C<trailingData> by setting the C<InputLength> option.

```
=back
```

```
=head2 Examples
```

To read the contents of the file C<file1.txt.bz2> and write the compressed data to the file C<file1.txt>.

```
use strict ;
use warnings ;
use IO::Uncompress::Bunzip2 qw(bunzip2 $Bunzip2Error) ;

my $input = "file1.txt.bz2";
my $output = "file1.txt";
bunzip2 $input => $output
    or die "bunzip2 failed: $Bunzip2Error\n";
```

To read from an existing Perl filehandle, C<\$input>, and write the uncompressed data to a buffer, C<\$buffer>.

```
use strict ;
use warnings ;
```

```

use IO::Uncompress::Bunzip2 qw(bunzip2 $Bunzip2Error) ;
use IO::File ;

my $input = new IO::File "<file1.txt.bz2"
    or die "Cannot open 'file1.txt.bz2': $!\n" ;
my $buffer ;
bunzip2 $input => \$buffer
    or die "bunzip2 failed: $Bunzip2Error\n";

```

To uncompress all files in the directory "/my/home" that match "\*.txt.bz2" and store the compressed data in the same directory

```

use strict ;
use warnings ;
use IO::Uncompress::Bunzip2 qw(bunzip2 $Bunzip2Error) ;

bunzip2 '</my/home/*.txt.bz2>' => '</my/home/#1.txt>'
    or die "bunzip2 failed: $Bunzip2Error\n";

```

and if you want to compress each file one at a time, this will do the trick

```

use strict ;
use warnings ;
use IO::Uncompress::Bunzip2 qw(bunzip2 $Bunzip2Error) ;

for my $input ( glob "/my/home/*.txt.bz2" )
{
    my $output = $input;
    $output =~ s/.bz2// ;
    bunzip2 $input => $output
        or die "Error compressing '$input': $Bunzip2Error\n";
}

```

=head1 OO Interface

=head2 Constructor

The format of the constructor for IO::Uncompress::Bunzip2 is shown below

```

my $z = new IO::Uncompress::Bunzip2 $input [OPTS]
    or die "IO::Uncompress::Bunzip2 failed: $Bunzip2Error\n";

```

Returns an C<IO::Uncompress::Bunzip2> object on success and undef on failure.  
The variable C<\$Bunzip2Error> will contain an error message on failure.

If you are running Perl 5.005 or better the object, C<\$z>, returned from IO::Uncompress::Bunzip2 can be used exactly like an L<IO::File|IO::File> filehandle.

This means that all normal input file operations can be carried out with C<\$z>. For example, to read a line from a compressed file/buffer you can use either of these forms

```
$line = $z->getline();  
$line = <$z>;
```

The mandatory parameter C<\$input> is used to determine the source of the compressed data. This parameter can take one of three forms.

=over 5

=item A filename

If the C<\$input> parameter is a scalar, it is assumed to be a filename. This file will be opened for reading and the compressed data will be read from it.

=item A filehandle

If the

C<\$input> parameter is a filehandle, the compressed data will be read from it.

The string '-' can be used as an alias for standard input.

=item A scalar reference

If C<\$input> is a scalar reference, the compressed data will be read from C<\$\$output>.

=back

=head2 Constructor Options

The option names defined below are case insensitive and can be optionally prefixed by a '-'. So all of the following are valid

```
-AutoClose  
-autoclose  
AUTOCLOSE  
autoclose
```

OPTS is a combination of the following options:

=over 5

=item C<< AutoClose => 0|1 >>

This option is only valid when the C<\$input> parameter is a filehandle. If

specified, and the value is true, it will result in the file being closed once either the C<close> method is called or the IO::Uncompress::Bunzip2 object is destroyed.

This parameter defaults to 0.

=item C<< MultiStream => 0|1 >>

Allows multiple concatenated compressed streams to be treated as a single compressed stream. Decompression will stop once either the end of the file/buffer is reached, an error is encountered (premature eof, corrupt compressed data) or the end of a stream is not immediately followed by the start of another stream.

This parameter defaults to 0.

=item C<< Prime => \$string >>

This option will uncompress the contents of C<\$string> before processing the input file/buffer.

This option can be useful when the compressed data is embedded in another file/data structure and it is not possible to work out where the compressed data begins without having to read the first few bytes. If this is the case, the uncompression can be I<primed> with these bytes using this option.

=item C<< Transparent => 0|1 >>

If this option is set and the input file/buffer is not compressed data, the module will allow reading of it anyway.

In addition, if the input file/buffer does contain compressed data and there is non-compressed data immediately following it, setting this option will make this module treat the whole file/buffer as a single data stream.

This option defaults to 1.

=item C<< BlockSize => \$num >>

When reading the compressed input data, IO::Uncompress::Bunzip2 will read it in blocks of C<\$num> bytes.

This option defaults to 4096.

=item C<< InputLength => \$size >>

When present this option will limit the number of compressed bytes read from the input file/buffer to C<\$size>. This option can be used in the situation where there is useful data directly after the compressed data stream and you know beforehand the exact length of the compressed data stream.

This option is mostly used when reading from a filehandle, in which case the file pointer will be left pointing to the first byte directly after the compressed data stream.

This option defaults to off.

=item C<< Append => 0|1 >>

This option controls what the C<read> method does with uncompressed data.

If set to 1, all uncompressed data will be appended to the output parameter of the C<read> method.

If set to 0, the contents of the output parameter of the C<read> method will be overwritten by the uncompressed data.

Defaults to 0.

=item C<< Strict => 0|1 >>

This option is a no-op.

=item C<< Small => 0|1 >>

When non-zero this options will make bzip2 use a decompression algorithm that uses less memory at the expense of increasing the amount of time taken for decompression.

Default is 0.

=back

=head2 Examples

TODO

=head1 Methods

=head2 read

Usage is

```
$status = $z->read($buffer)
```

Reads a block of compressed data (the size the the compressed block is determined by the C<Buffer> option in the constructor), uncompresses it and writes any uncompressed data into C<\$buffer>. If the C<Append> parameter is set in the constructor, the uncompressed data will be appended to the C<\$buffer> parameter. Otherwise C<\$buffer> will be overwritten.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

=head2 read

Usage is

```
$status = $z->read($buffer, $length)
```

```
$status
```

```
= $z->read($buffer, $length, $offset)
```

```
$status = read($z, $buffer, $length)
```

```
$status = read($z, $buffer, $length, $offset)
```

Attempt to read C<\$length> bytes of uncompressed data into C<\$buffer>.

The main difference between this form of the C<read> method and the previous one, is that this one will attempt to return I<exactly> C<\$length> bytes. The only circumstances that this function will not is if end-of-file or an IO error is encountered.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

=head2 getline

Usage is

```
$line = $z->getline()
```

```
$line = <$z>
```

Reads a single line.

This method fully supports the use of of the variable C<\$/> (or C<\$INPUT\_RECORD\_SEPARATOR> or C<\$RS> when C<English> is in use) to determine what constitutes an end of line. Paragraph mode, record mode and file slurp mode are all supported.

=head2 getc

Usage is

```
$char = $z->getc()
```

Read a single character.

=head2 ungetc

Usage is

```
$char = $z->ungetc($string)
```

=head2 getHeaderInfo

Usage is

```
$hdr = $z->getHeaderInfo();  
@hdrs = $z->getHeaderInfo();
```

This method returns either a hash reference (in scalar context) or a list or hash references (in array context) that contains information about each of the header fields in the compressed data stream(s).

=head2 tell

Usage is

```
$z->tell()  
tell $z
```

Returns the uncompressed file offset.

=head2 eof

Usage is

```
$z->eof();  
eof($z);
```

Returns true if the end of the compressed input stream has been reached.

=head2 seek

```
$z->seek($position, $whence);  
seek($z, $position, $whence);
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the input file/buffer.

It is a fatal error to attempt to seek backward.

The C<\$whence> parameter takes one the usual values, namely SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

=head2 binmode

Usage is

```
$z->binmode
binmode
$z ;
```

This is a noop provided for completeness.

=head2 opened

```
$z->opened()
```

Returns true if the object currently refers to a opened file/buffer.

=head2 autoflush

```
my $prev = $z->autoflush()
my $prev = $z->autoflush(EXPR)
```

If the C<\$z> object is associated with a file or a filehandle, this method returns the current autoflush setting for the underlying filehandle. If C<EXPR> is present, and is non-zero, it will enable flushing after every write/print operation.

If C<\$z> is associated with a buffer, this method has no effect and always returns C<undef>.

B<Note> that the special variable C<\$|> B<cannot> be used to set or retrieve the autoflush setting.

=head2 input\_line\_number

```
$z->input_line_number()
$z->input_line_number(EXPR)
```

Returns the current uncompressed line number. If C<EXPR> is present it has the effect of setting the line number. Note that setting the line number

does not change the current position within the file/buffer being read.

The contents

of C<\$/> are used to determine what constitutes a line terminator.

=head2 fileno

```
$z->fileno()  
fileno($z)
```

If the C<\$z> object is associated with a file or a filehandle, C<fileno> will return the underlying file descriptor. Once the C<close> method is called C<fileno> will return C<undef>.

If the C<\$z> object is associated with a buffer, this method will return C<undef>.

=head2 close

```
$z->close();  
close $z;
```

Closes the output file/buffer.

For most versions of Perl this method will be automatically invoked if the IO::Uncompress::Bunzip2 object is destroyed (either explicitly or by the variable with the reference to the object going out of scope). The exceptions are Perl versions 5.005 through 5.00504 and 5.8.0. In these cases, the C<close> method will be called automatically, but not until global destruction of all live objects when the program is terminating.

Therefore, if you want your scripts to be able to run on all versions of Perl, you should call

C<close> explicitly and not rely on automatic closing.

Returns true on success, otherwise 0.

If the C<AutoClose> option has been enabled when the IO::Uncompress::Bunzip2 object was created, and the object is associated with a file, the underlying file will also be closed.

=head2 nextStream

Usage is

```
my $status = $z->nextStream();
```

Skips to the next compressed data stream in the input file/buffer. If a new compressed data stream is found, the eof marker will be cleared and C<\$.> will be reset to 0.

Returns 1 if a new stream was found, 0 if none was found, and -1 if an error was encountered.

```
=head2 trailingData
```

Usage is

```
my $data = $z->trailingData();
```

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete. It only makes sense to call this method once the end of the compressed data stream has been encountered.

This option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, C<trailingData> will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, C<trailingData> will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using C<trailingData> if the input is a filename.

If you know the length of the compressed data stream before you start uncompressing, you can avoid having to use C<trailingData> by setting the C<InputLength> option in the constructor.

```
=head1 Importing
```

No symbolic constants are required by this IO::Uncompress::Bunzip2 at present.

```
=over 5
```

```
=item :all
```

Imports C<bunzip2> and C<\$Bunzip2Error>.

Same as doing this

```
use IO::Uncompress::Bunzip2 qw(bunzip2 $Bunzip2Error) ;
```

=back

=head1 NAME

IO::Uncompress::AnyUncompress - Uncompress gzip, zip, bzip2 or lzop file/buffer

=head1 SYNOPSIS

```
use IO::Uncompress::AnyUncompress qw(anyuncompress $AnyUncompressError);
```

```
my $status = anyuncompress $input => $output [,OPTS]
    or die "anyuncompress failed: $AnyUncompressError\n";
```

```
my $z = new IO::Uncompress::AnyUncompress $input [OPTS]
    or die "anyuncompress failed: $AnyUncompressError\n";
```

```
$status = $z->read($buffer)
$status = $z->read($buffer, $length)
$status = $z->read($buffer, $length, $offset)
$line = $z->getline()
$char = $z->getc()
$char = $z->ungetc()
$char = $z->opened()
```

```
$data = $z->trailingData()
$status = $z->nextStream()
$data = $z->getHeaderInfo()
$z->tell()
$z->seek($position, $whence)
$z->binmode()
$z->fileno()
$z->eof()
$z->close()
```

```
$AnyUncompressError;
```

```
# IO::File mode
```

```
<$z>
read($z,
$buffer);
read($z, $buffer, $length);
read($z, $buffer, $length, $offset);
tell($z)
seek($z, $position, $whence)
binmode($z)
```

fileno(\$z)

eof(\$z)

close(\$z)

=head1 DESCRIPTION

This module provides a Perl interface that allows the reading of files/buffers that have been compressed with a variety of compression libraries.

The formats supported are:

=over 5

=item RFC 1950

=item RFC 1951 (optionally)

=item gzip (RFC 1952)

=item zip

=item bzip2

=item lzop

=item lzf

=item lzma

=item xz

=back

The module will auto-detect which, if any, of the supported compression formats is being used.

=head1 Functional Interface

A top-level function, C<anyuncompress>, is provided to carry out "one-shot" uncompression between buffers and/or files. For finer control over the uncompression process, see the L<"/OO Interface"> section.

```
use IO::Uncompress::AnyUncompress qw(anyuncompress $AnyUncompressError);
```

```
anyuncompress $input_filename_or_reference =>
```

```
$output_filename_or_reference [,OPTS]
    or die "anyuncompress failed: $AnyUncompressError\n";
```

The functional interface needs Perl5.005 or better.

```
=head2 anyuncompress $input_filename_or_reference => $output_filename_or_reference [, OPTS]
```

C<anyuncompress> expects at least two parameters,  
C<\$input\_filename\_or\_reference> and C<\$output\_filename\_or\_reference>.

```
=head3 The C<$input_filename_or_reference> parameter
```

The parameter, C<\$input\_filename\_or\_reference>, is used to define the source of the compressed data.

It can take one of the following forms:

```
=over 5
```

```
=item A filename
```

If the C<\$input\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for reading and the input data will be read from it.

```
=item A filehandle
```

If the C<\$input\_filename\_or\_reference> parameter is a filehandle, the input data will be read from it. The string '-' can be used as an alias for standard input.

```
=item A scalar reference
```

If C<\$input\_filename\_or\_reference>  
is a scalar reference, the input data  
will be read from C<\$\$input\_filename\_or\_reference>.

```
=item An array reference
```

If C<\$input\_filename\_or\_reference> is an array reference, each element in the array must be a filename.

The input data will be read from each file in turn.

The complete array will be walked to ensure that it only contains valid filenames before any data is uncompressed.

```
=item An Input FileGlob string
```

If C<\$input\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<anyuncompress> will assume that it is an I<input fileglob string>. The input is the list of files that match the fileglob.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$input\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head3 The C<\$output\_filename\_or\_reference> parameter

The parameter C<\$output\_filename\_or\_reference> is used to control the destination of the uncompressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the uncompressed data will be written to it.

=item A filehandle

If the C<\$output\_filename\_or\_reference> parameter is a filehandle, the uncompressed data will be written to it. The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output\_filename\_or\_reference> is a scalar reference, the uncompressed data will be stored in C<\$\$output\_filename\_or\_reference>.

=item An Array Reference

If C<\$output\_filename\_or\_reference> is an array reference, the uncompressed data will be pushed onto the array.

=item An Output FileGlob

If C<\$output\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<anyuncompress> will assume that it is an

I<output fileglob string>. The output is the list of files that match the fileglob.

When

C<\$output\_filename\_or\_reference> is an fileglob string,  
C<\$input\_filename\_or\_reference> must also be a fileglob string. Anything else is an error.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$output\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head2 Notes

When C<\$input\_filename\_or\_reference> maps to multiple compressed files/buffers and C<\$output\_filename\_or\_reference> is a single file/buffer, after uncompression C<\$output\_filename\_or\_reference> will contain a concatenation of all the uncompressed data from each of the input files/buffers.

=head2 Optional Parameters

Unless specified below, the optional parameters for C<anyuncompress>, C<OPTS>, are the same as those used with the OO interface defined in the L</"Constructor Options"> section below.

=over 5

=item C<< AutoClose => 0|1 >>

This option applies to any input or output data streams to C<anyuncompress> that are filehandles.

If C<AutoClose> is specified, and the value is true, it will result in all input and/or output filehandles being closed once C<anyuncompress> has completed.

This parameter defaults to 0.

=item C<< BinModeOut => 0|1 >>

When writing to a file or filehandle, set C<binmode> before writing to the file.

Defaults to 0.

=item C<< Append => 0|1 >>

The behaviour of this option is dependent on the type of output data stream.

=over 5

=item \* A Buffer

If C<Append> is enabled, all uncompressed data will be append to the end of the output buffer. Otherwise the output buffer will be cleared before any uncompressed data is written to it.

=item \* A Filename

If C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any uncompressed data is written to it.

=item \* A Filehandle

If C<Append> is enabled, the filehandle will be positioned to the end of the file via a call to C<seek> before any uncompressed data is written to it. Otherwise the file pointer will not be moved.

=back

When C<Append> is specified, and set to true, it will I<append> all uncompressed data to the output data stream.

So when the output is a filehandle it will carry out a seek to the eof before writing any uncompressed data. If the output is a filename, it will be opened for appending. If the output is a buffer, all uncompressed data will be appended to the existing buffer.

Conversely when C<Append> is not specified, or it is present and is set to false, it will operate as follows.

When the output is a filename, it will truncate the contents of the file before writing any uncompressed data. If the output is a filehandle its position will not be changed. If the output is a buffer, it will be wiped before any uncompressed data is output.

Defaults to 0.

=item C<< MultiStream => 0|1 >>

If the input file/buffer contains multiple compressed data streams, this option will uncompress the whole lot as a single data stream.

Defaults to 0.

=item C<< TrailingData  
=> \$scalar >>

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete.

This option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, C<trailingData> will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, C<trailingData> will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using C<trailingData> if the input is a filename.

If you know the length of the compressed data stream before you start uncompressing, you can avoid having to use C<trailingData> by setting the C<InputLength> option.

=back

=head2 Examples

To read the contents of the file C<file1.txt.Compressed>  
and write the  
uncompressed data to the file C<file1.txt>.

```
use strict ;  
use warnings ;  
use IO::Uncompress::AnyUncompress qw(anyuncompress $AnyUncompressError) ;  
  
my $input = "file1.txt.Compressed";  
my $output = "file1.txt";  
anyuncompress $input => $output  
  or die "anyuncompress failed: $AnyUncompressError\n";
```

To read from an existing Perl filehandle, C<\$input>, and write the uncompressed data to a buffer, C<\$buffer>.

```
use strict ;
use warnings ;
use IO::Uncompress::AnyUncompress qw(anyuncompress $AnyUncompressError) ;
use IO::File ;

my $input = new IO::File "<file1.txt.Compressed"
    or die "Cannot open 'file1.txt.Compressed': $!\n" ;
my $buffer ;
anyuncompress $input => \$buffer
    or die "anyuncompress failed: $AnyUncompressError\n";
```

To uncompress all files in the directory "/my/home" that match "\*.txt.Compressed" and store the compressed data in the same directory

```
use strict ;
use warnings ;

use IO::Uncompress::AnyUncompress qw(anyuncompress $AnyUncompressError) ;

anyuncompress '</my/home/*.txt.Compressed>' => '</my/home/#1.txt>'
    or die "anyuncompress failed: $AnyUncompressError\n";
```

and if you want to compress each file one at a time, this will do the trick

```
use strict ;
use warnings ;
use IO::Uncompress::AnyUncompress qw(anyuncompress $AnyUncompressError) ;

for my $input ( glob "/my/home/*.txt.Compressed" )
{
    my $output = $input;
    $output =~ s/.Compressed// ;
    anyuncompress $input => $output
        or die "Error compressing '$input': $AnyUncompressError\n";
}
```

=head1 OO Interface

=head2 Constructor

The format of the constructor for IO::Uncompress::AnyUncompress is shown below

```
my $z = new IO::Uncompress::AnyUncompress $input [OPTS]
    or die "IO::Uncompress::AnyUncompress failed: $AnyUncompressError\n";
```

Returns an `C<IO::Uncompress::AnyUncompress>` object on success and undef on failure.

The variable

`C<$AnyUncompressError>` will contain an error message on failure.

If you are running Perl 5.005 or better the object, `C<$z>`, returned from

`IO::Uncompress::AnyUncompress` can be used exactly like an `L<IO::File|IO::File>` filehandle.

This means that all normal input file operations can be carried out with

`C<$z>`. For example, to read a line from a compressed file/buffer you can

use either of these forms

```
$line = $z->getline();
```

```
$line = <$z>;
```

The mandatory parameter `C<$input>` is used to determine the source of the compressed data. This parameter can take one of three forms.

=over 5

=item A filename

If the `C<$input>` parameter is a scalar, it is assumed to be a filename. This file will be opened for reading and the compressed data will be read from it.

=item A filehandle

If the `C<$input>` parameter is a filehandle, the compressed data will be read from it.

The string `'-'` can be used as an alias for standard input.

=item A scalar reference

If `C<$input>` is a scalar reference, the compressed data will be read from `C<$$input>`.

=back

=head2 Constructor Options

The option names defined below are case insensitive and can be optionally prefixed by a `'-'`. So all of the following are valid

`-AutoClose`

`-autoclose`

`AUTOCLOSE`

`autoclose`

OPTS is a combination of the following options:

=over 5

=item C<< AutoClose => 0|1 >>

This option is only valid when the C<\$input> parameter is a filehandle. If specified, and the value is true, it will result in the file being closed once either the C<close> method is called or the IO::Uncompress::AnyUncompress object is destroyed.

This parameter defaults to 0.

=item C<< MultiStream => 0|1 >>

Allows multiple concatenated compressed streams to be treated as a single compressed stream. Decompression will stop once either the end of the file/buffer is reached, an error is encountered (premature eof, corrupt compressed data) or the end of a stream is not immediately followed by the start of another stream.

This parameter defaults to 0.

=item C<< Prime => \$string >>

This option will uncompress the contents of C<\$string> before processing the input file/buffer.

This option can be useful when the compressed data is embedded in another file/data structure and it is not possible to work out where the compressed data begins without having to read the first few bytes. If this is the case, the uncompression can be I<primed> with these bytes using this option.

=item C<< Transparent => 0|1 >>

If this option is set and the input file/buffer is not compressed data, the module will allow reading of it anyway.

In addition, if the input file/buffer does contain compressed data and there is non-compressed data immediately following it, setting this option will make this module treat the whole file/buffer as a single data stream.

This option defaults to 1.

=item C<< BlockSize => \$num >>

When reading the compressed input data, IO::Uncompress::AnyUncompress will read it in

blocks of C<\$num> bytes.

This

option defaults to 4096.

=item C<< InputLength => \$size >>

When present this option will limit the number of compressed bytes read from the input file/buffer to C<\$size>. This option can be used in the situation where there is useful data directly after the compressed data stream and you know beforehand the exact length of the compressed data stream.

This option is mostly used when reading from a filehandle, in which case the file pointer will be left pointing to the first byte directly after the compressed data stream.

This option defaults to off.

=item C<< Append => 0|1 >>

This option controls what the C<read> method does with uncompressed data.

If set to 1, all uncompressed data will be appended to the output parameter of the C<read> method.

If set to 0, the contents of the output parameter of the C<read> method will be overwritten by the uncompressed data.

Defaults to 0.

=item C<< Strict => 0|1 >>

This option controls whether the extra checks defined below are used when carrying out the decompression. When Strict is on, the extra tests are carried out, when Strict is off they are not.

The default for this option is off.

=item C<< RawInflate => 0|1 >>

When auto-detecting the compressed format, try to test for raw-deflate (RFC 1951) content using the C<IO::Uncompress::RawInflate> module.

The reason this is not default behaviour is because RFC 1951 content can only be detected by attempting to uncompress it. This process is error prone and can result in false positives.

Defaults to 0.

=item C<< UnLzma => 0|1 >>

When auto-detecting the compressed format, try to test for lzma\_alone content using the C<IO::Uncompress::UnLzma> module.

The reason this is not default behaviour is because lzma\_alone content can only be detected by attempting to uncompress it. This process is error prone and can result in false positives.

Defaults to 0.

=back

=head2 Examples

TODO

=head1 Methods

=head2 read

Usage is

```
$status = $z->read($buffer)
```

Reads a

block of compressed data (the size of the compressed block is determined by the C<Buffer> option in the constructor), uncompresses it and writes any uncompressed data into C<\$buffer>. If the C<Append> parameter is set in the constructor, the uncompressed data will be appended to the C<\$buffer> parameter. Otherwise C<\$buffer> will be overwritten.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

=head2 read

Usage is

```
$status = $z->read($buffer, $length)
```

```
$status = $z->read($buffer, $length, $offset)
```

```
$status = read($z, $buffer, $length)
```

```
$status = read($z, $buffer, $length, $offset)
```

Attempt to read C<\$length> bytes of uncompressed data into C<\$buffer>.

The main difference between this form of the C<read> method and the previous one, is that this one will attempt to return I<exactly> C<\$length> bytes. The only circumstances that this function will not is if end-of-file or an IO error is encountered.

Returns the

number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

=head2 getline

Usage is

```
$line = $z->getline()  
$line = <$z>
```

Reads a single line.

This method fully supports the use of of the variable C<\$/> (or C<\$INPUT\_RECORD\_SEPARATOR> or C<\$RS> when C<English> is in use) to determine what constitutes an end of line. Paragraph mode, record mode and file slurp mode are all supported.

=head2 getc

Usage is

```
$char = $z->getc()
```

Read a single character.

=head2 ungetc

Usage is

```
$char = $z->ungetc($string)
```

=head2 getHeaderInfo

Usage is

```
$hdr = $z->getHeaderInfo();  
@hdrs = $z->getHeaderInfo();
```

This method returns either a hash reference (in scalar context) or a list or hash references (in array context) that contains information about each

of the header fields in the compressed data stream(s).

=head2 tell

Usage is

```
$z->tell()  
tell $z
```

Returns the uncompressed file offset.

=head2 eof

Usage is

```
$z->eof();  
  
eof($z);
```

Returns true if the end of the compressed input stream has been reached.

=head2 seek

```
$z->seek($position, $whence);  
seek($z, $position, $whence);
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the input file/buffer.

It is a fatal error to attempt to seek backward.

Note that the implementation of C<seek> in this module does not provide true random access to a compressed file/buffer. It works by uncompressing data from the current offset in the file/buffer until it reaches the uncompressed offset specified in the parameters to C<seek>. For very small files this may be acceptable behaviour. For large files it may cause an unacceptable delay.

The C<\$whence> parameter takes one the usual values, namely SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

=head2 binmode

Usage is

```
$z->binmode  
binmode $z ;
```

This is a noop provided for completeness.

```
=head2 opened
```

```
$z->opened()
```

#### Returns

true if the object currently refers to a opened file/buffer.

```
=head2 autoflush
```

```
my $prev = $z->autoflush()  
my $prev = $z->autoflush(EXPR)
```

If the C<\$z> object is associated with a file or a filehandle, this method returns the current autoflush setting for the underlying filehandle. If C<EXPR> is present, and is non-zero, it will enable flushing after every write/print operation.

If C<\$z> is associated with a buffer, this method has no effect and always returns C<undef>.

B<Note> that the special variable C<\$|> B<cannot> be used to set or retrieve the autoflush setting.

```
=head2 input_line_number
```

```
$z->input_line_number()  
$z->input_line_number(EXPR)
```

Returns the current uncompressed line number. If C<EXPR> is present it has the effect of setting the line number. Note that setting the line number does not change the current position within the file/buffer being read.

The contents of C<\$/> are used to to determine what constitutes a line terminator.

```
=head2 fileno
```

```
$z->fileno()  
fileno($z)
```

If the C<\$z> object is associated with a file or a filehandle, C<fileno> will return the underlying file descriptor. Once the C<close> method is called C<fileno> will return C<undef>.

If the C<\$z> object is associated with a buffer, this method will return

C<undef>.

```
=head2 close
```

```
$z->close();  
close $z;
```

Closes the output file/buffer.

For most versions of Perl this method will be automatically invoked if the IO::Uncompress::AnyUncompress object is destroyed (either explicitly or by the variable with the reference to the object going out of scope). The exceptions are Perl versions 5.005 through 5.00504 and 5.8.0. In these cases, the C<close> method will be called automatically, but not until global destruction of all live objects when the program is terminating.

Therefore, if you want your scripts to be able to run on all versions of Perl, you should call C<close> explicitly and not rely on automatic closing.

Returns true on success, otherwise  
0.

If the C<AutoClose> option has been enabled when the IO::Uncompress::AnyUncompress object was created, and the object is associated with a file, the underlying file will also be closed.

```
=head2 nextStream
```

Usage is

```
my $status = $z->nextStream();
```

Skips to the next compressed data stream in the input file/buffer. If a new compressed data stream is found, the eof marker will be cleared and C<\$.> will be reset to 0.

Returns 1 if a new stream was found, 0 if none was found, and -1 if an error was encountered.

```
=head2 trailingData
```

Usage is

```
my $data = $z->trailingData();
```

Returns the data, if any, that is present immediately after the compressed

data stream once uncompression is complete. It only makes sense to call this method once the end of the compressed data stream has been encountered.

This option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, `C<trailingData>` will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, `C<trailingData>` will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using `C<trailingData>` if the input is a filename.

If you know the length of the compressed data stream before you start uncompressing, you can avoid having to use `C<trailingData>` by setting the `C<InputLength>` option in the constructor.

=head1 Importing

No symbolic constants are required by this `IO::Uncompress::AnyUncompress` at present.

=over 5

=item :all

Imports `C<anyuncompress>` and `C<$AnyUncompressError>`.

Same as doing this

```
use IO::Uncompress::AnyUncompress qw(anyuncompress $AnyUncompressError);
```

=back

=head1 NAME

File::GlobMapper - Extend File Glob to Allow Input and Output Files

=head1 SYNOPSIS

```
use File::GlobMapper qw( globmap );  
  
my $aref = globmap $input => $output  
    or die $File::GlobMapper::Error ;  
  
my $gm = new File::GlobMapper $input => $output  
    or die $File::GlobMapper::Error ;
```

=head1 DESCRIPTION

This module needs Perl5.005 or better.

This module takes the existing C<File::Glob> module as a starting point and

extends it to allow new filenames to be derived from the files matched by C<File::Glob>.

This can be useful when carrying out batch operations on multiple files that have both an input filename and output filename and the output file can be derived from the input filename. Examples of operations where this can be useful include, file renaming, file copying and file compression.

=head2 Behind The Scenes

To help explain what C<File::GlobMapper> does, consider what code you would write if you wanted to rename all files in the current directory that ended in C<.tar.gz> to C<.tgz>. So say these files are in the current directory

```
alpha.tar.gz
beta.tar.gz
gamma.tar.gz
```

and they need renamed to this

```
alpha.tgz
beta.tgz
gamma.tgz
```

Below is a possible implementation of a script to carry out the rename (error cases have been omitted)

```
foreach my $old ( glob "*.tar.gz" )
{
    my $new = $old;
    $new =~ s#(.*?)\.tar\.gz##$1.tgz# ;

    rename $old => $new
        or die "Cannot rename '$old' to '$new': $!\n";
}
```

Notice that a file glob pattern C<\*.tar.gz> was used to match the C<.tar.gz> files, then a fairly similar regular expression was used in the substitute to allow the new filename to be created.

Given that the file glob is just a cut-down regular expression and that it has already done a lot of the hard work in pattern matching the filenames, wouldn't it be handy to be able to use the patterns in the fileglob to drive the new filename?

Well, that's I<exactly> what C<File::GlobMapper> does.

Here is same snippet of code rewritten using C<globmap>

```
for my $pair (globmap '<*.tar.gz>' => '<#1.tgz>' )
{
    my ($from, $to) = @$pair;
    rename $from => $to
        or die "Cannot rename '$old' to '$new': $!\n";
}
```

So how does it work?

Behind the scenes the C<globmap> function does a combination of a file glob to match existing filenames followed by a substitute to create the new filenames.

Notice how both parameters to C<globmap> are strings that are delimited by <>. This is done to make them look more like file globs - it is just syntactic sugar, but it can be handy when you want the strings to be visually distinctive. The enclosing <> are optional, so you don't have to use them - in fact the first thing globmap will do is remove these delimiters if they are present.

The first parameter to C<globmap>, C<\*.tar.gz>, is an I<Input File Glob>. Once the enclosing "< ... >" is removed, this is passed (more or less) unchanged to C<File::Glob> to carry out a file match.

Next the fileglob C<\*.tar.gz> is transformed behind the scenes into a full Perl regular expression, with the additional step of wrapping each transformed wildcard metacharacter sequence in parenthesis.

In this case the input fileglob C<\*.tar.gz> will be transformed into this Perl regular expression

```
([^\/*]).tar.gz
```

Wrapping with parenthesis allows the wildcard parts of the Input File Glob to be referenced by the second parameter to C<globmap>, C<#1.tgz>, the I<Output File Glob>. This parameter operates just like the replacement part of a substitute command. The difference is that the C<#1> syntax is used to reference sub-patterns matched in the input fileglob, rather than the C<\$1> syntax that is used with perl regular expressions. In this case C<#1> is used to refer to the text matched by the C<\*> in the Input File Glob. This makes it easier to use this module where

the  
parameters to `C<globmap>` are typed at the command line.

The final step involves passing each filename matched by the `C<*.tar.gz>` file glob through the derived Perl regular expression in turn and expanding the output fileglob using it.

The end result of all this is a list of pairs of filenames. By default that is what is returned by `C<globmap>`. In this example the data structure returned will look like this

```
( ['alpha.tar.gz' => 'alpha.tgz'],  
  ['beta.tar.gz' => 'beta.tgz' ],  
  ['gamma.tar.gz' => 'gamma.tgz']  
)
```

Each pair is an array reference with two elements - namely the `I<from>` filename, that `C<File::Glob>` has matched, and a `I<to>` filename that is derived from the `I<from>` filename.

## =head2 Limitations

`C<File::GlobMapper>` has been kept simple deliberately, so it isn't intended to solve all filename mapping operations. Under the hood `C<File::Glob>` (or for older versions of Perl, `C<File::BSDGlob>`) is used to match the files, so you will never have the flexibility of full Perl regular expression.

## =head2 Input File Glob

The syntax for an Input FileGlob is identical to `C<File::Glob>`, except for the following

=over 5

=item 1.

No nested { }

=item 2.

Whitespace does not delimit fileglobs.

=item 3.

The use of parenthesis can be used to capture parts of the input filename.

=item 4.

If an Input glob matches the same file more than once, only the first will be used.

=back

The syntax

=over 5

=item B<~>

=item B<~user>

=item B<.>

Matches a literal '.'.

Equivalent to the Perl regular expression

\.

=item B<\*>

Matches zero or more characters, except '/'. Equivalent to the Perl regular expression

[^/]\*

=item B<?>

Matches zero or one character, except '/'. Equivalent to the Perl regular expression

[^/?]

=item B<<>

Backslash is used, as usual, to escape the next character.

=item B<[]>

Character class.

=item B<{,}>

Alternation

=item B<()>

Capturing parenthesis that work just like perl

=back

Any other character

it taken literally.

=head2 Output File Glob

The Output File Glob is a normal string, with 2 glob-like features.

The first is the '\*' metacharacter. This will be replaced by the complete filename matched by the input file glob. So

```
*.c *.Z
```

The second is

Output FileGlobs take the

=over 5

=item "\*"

The "\*" character will be replaced with the complete input filename.

=item #1

Patterns of the form /#\d/ will be replaced with the

=back

=head2 Returned Data

=head1 EXAMPLES

=head2 A Rename script

Below is a simple "rename" script that uses C<globmap> to determine the source and destination filenames.

```
use File::GlobMapper qw(globmap) ;
```

```

use File::Copy;

die "rename: Usage rename 'from' 'to'\n"
    unless @ARGV == 2 ;

my $fromGlob = shift @ARGV;
my $toGlob = shift @ARGV;

my $pairs = globmap($fromGlob, $toGlob)
    or die $File::GlobMapper::Error;

for my $pair (@$pairs)
{
    my ($from, $to) = @$pair;
    move $from
=> $to ;
}

```

Here is an example that renames all c files to cpp.

```
$ rename '*.c' '#1.cpp'
```

=head2 A few example globmaps

Below are a few examples of globmaps

To copy all your .c file to a backup directory

```
'</my/home/*.c>' '</my/backup/#1.c>'
```

If you want to compress all

```
'</my/home/*.ch>' '<*.gz>'
```

To uncompress

```
'</my/home/*.ch.gz>' '</my/home/#1.#2>'
```

=head1 NAME

IO::Uncompress::RawInflate - Read RFC 1951 files/buffers

=head1 SYNOPSIS

```
use IO::Uncompress::RawInflate qw(rawinflate $RawInflateError) ;
```

```
my $status = rawinflate $input => $output [,OPTS]  
    or die "rawinflate failed: $RawInflateError\n";
```

```
my $z = new IO::Uncompress::RawInflate $input [OPTS]  
    or die "rawinflate failed: $RawInflateError\n";
```

```
$status = $z->read($buffer)  
$status = $z->read($buffer, $length)  
$status = $z->read($buffer, $length, $offset)  
$line = $z->getline()  
$char = $z->getc()  
$char = $z->ungetc()  
$char = $z->opened()
```

```
$status = $z->inflateSync()
```

```
$data = $z->trailingData()  
$status = $z->nextStream()  
$data = $z->getHeaderInfo()  
$z->tell()  
$z->seek($position, $whence)  
$z->binmode()  
$z->fileno()  
$z->eof()  
$z->close()
```

```
$RawInflateError ;
```

# IO::File mode

```
<$z>
read($z, $buffer);
read($z,
$buffer, $length);
read($z, $buffer, $length, $offset);
tell($z)
seek($z, $position, $whence)
binmode($z)
fileno($z)
eof($z)
close($z)
```

=head1 DESCRIPTION

This module provides a Perl interface that allows the reading of files/buffers that conform to RFC 1951.

For writing RFC 1951 files/buffers, see the companion module `IO::Compress::RawDeflate`.

=head1 Functional Interface

A top-level function, `C<rawinflate>`, is provided to carry out "one-shot" uncompression between buffers and/or files. For finer control over the uncompression process, see the [L<"OO Interface">](#) section.

```
use IO::Uncompress::RawInflate qw(rawinflate $RawInflateError) ;
```

```
rawinflate $input_filename_or_reference => $output_filename_or_reference [,OPTS]
    or die "rawinflate failed: $RawInflateError\n";
```

The functional interface needs Perl5.005 or better.

=head2 `rawinflate $input_filename_or_reference => $output_filename_or_reference [, OPTS]`

`C<rawinflate>` expects at least two parameters, `C<$input_filename_or_reference>` and `C<$output_filename_or_reference>`.

=head3 The `C<$input_filename_or_reference>` parameter

The parameter, `C<$input_filename_or_reference>`, is used to define the source of the compressed data.

It can take one of the following forms:

=over 5

=item A filename

If the C<\$input\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for reading and the input data will be read from it.

=item A filehandle

If the C<\$input\_filename\_or\_reference> parameter is a filehandle, the input data will be read from it. The string '-' can be used as an alias for standard input.

=item A scalar reference

If C<\$input\_filename\_or\_reference> is a scalar reference, the input data will be read from C<\$\$input\_filename\_or\_reference>.

=item An array reference

If C<\$input\_filename\_or\_reference> is an array reference, each element in the array must be a filename.

The input data will be read from each file in turn.

The complete array will be walked to ensure that it only contains valid filenames before any data is uncompressed.

=item An Input FileGlob string

If C<\$input\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<rawinflate> will assume that it is an I<input fileglob string>. The input is the list of files that match the fileglob.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$input\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head3 The C<\$output\_filename\_or\_reference> parameter

The parameter C<\$output\_filename\_or\_reference> is used to control the destination of the uncompressed data. This parameter can take one of

these forms.

=over 5

=item A filename

If the C<\$output\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the uncompressed data will be written to it.

=item A filehandle

If

the C<\$output\_filename\_or\_reference> parameter is a filehandle, the uncompressed data will be written to it. The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output\_filename\_or\_reference> is a scalar reference, the uncompressed data will be stored in C<\$\$output\_filename\_or\_reference>.

=item An Array Reference

If C<\$output\_filename\_or\_reference> is an array reference, the uncompressed data will be pushed onto the array.

=item An Output FileGlob

If C<\$output\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<rawinflate> will assume that it is an I<output fileglob string>. The output is the list of files that match the fileglob.

When C<\$output\_filename\_or\_reference> is a fileglob string, C<\$input\_filename\_or\_reference> must also be a fileglob string. Anything else is an error.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$output\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head2 Notes

When C<\$input\_filename\_or\_reference> maps to multiple compressed files/buffers and C<\$output\_filename\_or\_reference> is a single file/buffer, after uncompression C<\$output\_filename\_or\_reference> will contain a concatenation of all the uncompressed data from each of the input files/buffers.

=head2 Optional Parameters

Unless specified below, the optional parameters for C<rawinflate>, C<OPTS>, are the same as those used with the OO interface defined in the L</"Constructor Options"> section below.

=over 5

=item C<< AutoClose => 0|1 >>

This option applies to any input or output data streams to C<rawinflate> that are filehandles.

If C<AutoClose> is specified, and the value is true, it will result in all input and/or output filehandles being closed once C<rawinflate> has completed.

This parameter defaults to 0.

=item C<< BinModeOut => 0|1 >>

When writing to a file or filehandle, set C<binmode> before writing to the file.

Defaults to  
0.

=item C<< Append => 0|1 >>

The behaviour of this option is dependent on the type of output data stream.

=over 5

=item \* A Buffer

If C<Append> is enabled, all uncompressed data will be append to the end of the output buffer. Otherwise the output buffer will be cleared before any uncompressed data is written to it.

=item \* A Filename

If C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any uncompressed data is written to it.

=item \* A Filehandle

If C<Append> is enabled, the filehandle will be positioned to the end of the file via a call to C<seek> before any uncompressed data is written to it. Otherwise the file pointer will not be moved.

=back

When C<Append> is specified, and set to true, it will I<append> all uncompressed data to the output data stream.

So when the output is a filehandle it will carry out a seek to the eof before writing any uncompressed data. If the output is a filename, it will be opened for appending. If the output is a buffer, all uncompressed data will be appended to the existing buffer.

Conversely when C<Append> is not specified, or it is present and is set to false, it will operate as follows.

When the output is a filename, it will truncate the contents of the file before writing any uncompressed data. If the output is a filehandle its position will not be changed. If the output is a buffer, it will be wiped before any uncompressed data is output.

Defaults to 0.

=item C<< MultiStream => 0|1 >>

This option is a no-op.

=item C<< TrailingData => \$scalar >>

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete.

This option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, C<trailingData> will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, C<trailingData> will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using C<trailingData> if the input is a filename.

If you know the length of the compressed data stream before you start uncompressing, you can avoid having to use C<trailingData> by setting the C<InputLength> option.

=back

=head2 Examples

To read the contents of the file C<file1.txt.1951> and write the uncompressed data to the file C<file1.txt>.

```
use strict ;
use warnings ;
use IO::Uncompress::RawInflate qw(rawinflate $RawInflateError) ;

my $input = "file1.txt.1951";
my $output = "file1.txt";
rawinflate $input => $output
    or die "rawinflate failed: $RawInflateError\n";
```

To read from an existing Perl filehandle, C<\$input>, and write the uncompressed data to a buffer, C<\$buffer>.

```
use strict ;
use warnings ;
use IO::Uncompress::RawInflate qw(rawinflate $RawInflateError) ;
use IO::File ;

my $input = new IO::File "<file1.txt.1951"
    or die "Cannot open 'file1.txt.1951': $!\n" ;
my $buffer ;
rawinflate $input => \ $buffer
    or die "rawinflate failed: $RawInflateError\n";
```

To uncompress all files in the directory "/my/home" that match "\*.txt.1951" and store the compressed data in the same directory

```
use strict ;
use warnings ;
use IO::Uncompress::RawInflate qw(rawinflate $RawInflateError) ;
```

```
rawinflate '</my/home/*.txt.1951>' => '</my/home/#1.txt>'
  or die "rawinflate failed: $RawInflateError\n";
```

and if you want to compress each file one at a time, this will do the trick

```
use strict ;
use warnings ;
use IO::Uncompress::RawInflate qw(rawinflate $RawInflateError) ;

for my $input ( glob "/my/home/*.txt.1951" )
{
  my $output = $input;
  $output =~ s/.1951// ;
  rawinflate $input => $output
    or die "Error compressing '$input': $RawInflateError\n";
}
```

=head1 OO Interface

=head2 Constructor

The format of the constructor for IO::Uncompress::RawInflate is shown below

```
my $z = new IO::Uncompress::RawInflate $input [OPTS]
  or die "IO::Uncompress::RawInflate failed: $RawInflateError\n";
```

Returns an C<IO::Uncompress::RawInflate> object on success and undef on failure.

The variable C<\$RawInflateError> will contain an error message on failure.

If you are running Perl 5.005 or better the object, C<\$z>, returned from IO::Uncompress::RawInflate can be used exactly like an L<IO::File|IO::File> filehandle. This means that all normal input file operations can be carried out with C<\$z>. For example, to read a line from a compressed file/buffer you can use either of these forms

```
$line = $z->getline();
$line = <$z>;
```

The mandatory parameter C<\$input> is used to determine the source of the compressed data. This parameter can take one of three forms.

=over 5

=item A filename

If the C<\$input> parameter is a scalar, it is assumed to be a filename. This file will be opened for reading and the compressed data will be read from it.

=item A filehandle

If the C<\$input> parameter is a filehandle, the compressed data will be read from it.

The string '-' can be used as an alias for standard input.

=item A scalar reference

If C<\$input> is a scalar reference, the compressed data will be read from C<\$\$input>.

=back

=head2 Constructor Options

The option names defined below are case insensitive and can be optionally prefixed by a '-'. So all of the following are valid

- AutoClose
- autoclose
- AUTOCLOSE
- autoclose

OPTS is a combination of the following options:

=over 5

=item C<< AutoClose => 0|1 >>

This option is only valid when the C<\$input> parameter is a filehandle. If specified, and the value is true, it will result in the file being closed once either the C<close> method is called or the IO::Uncompress::RawInflate object is destroyed.

This parameter defaults to 0.

=item C<< MultiStream => 0|1 >>

Allows multiple concatenated compressed streams to be treated as a single compressed stream. Decompression will stop once either the end of the file/buffer is reached, an error is encountered (premature eof, corrupt compressed data) or the end of a stream is not immediately followed by the start of another stream.

This parameter defaults to 0.

=item C<< Prime => \$string >>

This option will uncompress the contents of C<\$string> before processing the input file/buffer.

This option can be useful when the compressed data is embedded in another file/data structure and it is not possible to work out where the compressed data begins without having to read the first few bytes. If this is the case, the uncompression can be I<primed> with these bytes using this option.

=item C<< Transparent => 0|1 >>

If this option is set and the input file/buffer is not compressed data, the module will allow reading of it anyway.

In addition, if the input file/buffer does contain compressed data and there is non-compressed data immediately following it, setting this option will make this module treat the whole file/buffer as a single data stream.

This option defaults to 1.

=item C<< BlockSize => \$num >>

When reading the compressed input data, IO::Uncompress::RawInflate will read it in blocks of C<\$num> bytes.

This option defaults to 4096.

=item C<< InputLength => \$size >>

When present this option will limit the number of compressed bytes read from the input file/buffer to C<\$size>. This option can be used in the situation where there is useful data directly after the compressed data stream and you know beforehand the exact length of the compressed data stream.

This option is mostly used when reading from a filehandle, in which case the file pointer will be left pointing to the first byte directly after the compressed data stream.

This option defaults to off.

=item

C<< Append => 0|1 >>

This option controls what the C<read> method does with uncompressed data.

If set to 1, all uncompressed data will be appended to the output parameter of the C<read> method.

If set to 0, the contents of the output parameter of the C<read> method will be overwritten by the uncompressed data.

Defaults to 0.

=item C<< Strict => 0|1 >>

This option is a no-op.

=back

=head2 Examples

TODO

=head1 Methods

=head2 read

Usage is

```
$status = $z->read($buffer)
```

Reads a block of compressed data (the size the the compressed block is determined by the C<Buffer> option in the constructor), uncompresses it and writes any uncompressed data into C<\$buffer>. If the C<Append> parameter is set in the constructor, the uncompressed data will be appended to the C<\$buffer> parameter. Otherwise C<\$buffer> will be overwritten.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

=head2 read

Usage is

```
$status = $z->read($buffer,  
$length)  
$status = $z->read($buffer, $length, $offset)
```

```
$status = read($z, $buffer, $length)  
$status = read($z, $buffer, $length, $offset)
```

Attempt to read C<\$length> bytes of uncompressed data into C<\$buffer>.

The main difference between this form of the C<read> method and the previous one, is that this one will attempt to return I<exactly> C<\$length> bytes. The only circumstances that this function will not is if end-of-file or an IO error is encountered.

Returns the number of uncompressed bytes written to C<\$buffer>, zero if eof or a negative number on error.

=head2 getline

Usage is

```
$line = $z->getline()  
$line = <$z>
```

Reads a single line.

This method fully supports the use of of the variable C<\$/> (or C<\$INPUT\_RECORD\_SEPARATOR> or C<\$RS> when C<English> is in use) to determine what constitutes an end of line. Paragraph mode, record mode and file slurp mode are all supported.

=head2 getc

Usage is

```
$char = $z->getc()
```

Read a single character.

=head2  
ungetc

Usage is

```
$char = $z->ungetc($string)
```

=head2 inflateSync

Usage is

```
$status = $z->inflateSync()
```

TODO

=head2 getHeaderInfo

Usage is

```
$hdr = $z->getHeaderInfo();  
@hdrs = $z->getHeaderInfo();
```

This method returns either a hash reference (in scalar context) or a list of hash references (in array context) that contains information about each of the header fields in the compressed data stream(s).

=head2 tell

Usage is

```
$z->tell()  
tell $z
```

Returns the uncompressed file offset.

=head2 eof

Usage is

```
$z->eof();  
eof($z);
```

Returns true if the end of the compressed input stream has been reached.

=head2 seek

```
$z->seek($position, $whence);  
seek($z, $position, $whence);
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the input file/buffer.

It is a fatal error to attempt to seek backward.

Note that the implementation of C<seek> in this module does not provide true

random access to a compressed file/buffer. It works by uncompressing data from the current offset in the file/buffer until it reaches the uncompressed offset specified in the parameters to C<seek>. For very small files this may be acceptable behaviour. For large files it may cause an unacceptable delay.

The C<\$whence> parameter takes one the usual values, namely SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

=head2 binmode

Usage is

```
$z->binmode  
binmode $z ;
```

This is a noop provided for completeness.

=head2 opened

```
$z->opened()
```

Returns true if the object currently refers to a opened file/buffer.

=head2 autoflush

```
my $prev = $z->autoflush()  
my $prev = $z->autoflush(EXPR)
```

If the C<\$z> object is associated with a file or a filehandle, this method returns the current autoflush setting for the underlying filehandle. If C<EXPR> is present, and is non-zero, it will enable flushing after every write/print operation.

If C<\$z> is associated with a buffer, this method has no effect and always returns C<undef>.

B<Note> that the special variable C<\$|> B<cannot> be used to set or retrieve the autoflush setting.

=head2 input\_line\_number

```
$z->input_line_number()  
$z->input_line_number(EXPR)
```

Returns the current uncompressed line number. If C<EXPR> is present it has the effect of setting the line number. Note that setting the line number does not change the current position within the file/buffer being read.

The contents of C<\$|> are used to determine what constitutes a line terminator.

=head2 fileno

```
$z->fileno()
```

`fileno($z)`

If the `C<$z>` object is associated with a file or a filehandle, `C<fileno>` will return the underlying file descriptor. Once the `C<close>` method is called `C<fileno>` will return `C<undef>`.

If the `C<$z>` object is associated with a buffer, this method will return `C<undef>`.

`=head2 close`

```
$z->close();  
close $z;
```

Closes the output file/buffer.

For most versions of Perl this method will be automatically invoked if the `IO::Uncompress::RawInflate` object is destroyed (either explicitly or by the variable with the reference to the object going out of scope). The exceptions are Perl versions 5.005 through 5.00504 and 5.8.0. In these cases, the `C<close>` method will be called automatically, but not until global destruction of all live objects when the program is terminating.

Therefore, if you want your scripts to be able to run on all versions of Perl, you should call `C<close>` explicitly and not rely on automatic closing.

Returns true on success, otherwise 0.

If the `C<AutoClose>` option has been enabled when the `IO::Uncompress::RawInflate` object was created, and the object is associated with a file, the underlying file will also be closed.

`=head2 nextStream`

Usage is

```
my $status = $z->nextStream();
```

Skips to the next compressed data stream in the input file/buffer. If a new compressed data stream is found, the eof marker will be cleared and `C<$.>` will be reset to 0.

Returns

1 if a new stream was found, 0 if none was found, and -1 if an error was encountered.

=head2 trailingData

Usage is

```
my $data = $z->trailingData();
```

Returns the data, if any, that is present immediately after the compressed data stream once uncompression is complete. It only makes sense to call this method once the end of the compressed data stream has been encountered.

This option can be used when there is useful information immediately following the compressed data stream, and you don't know the length of the compressed data stream.

If the input is a buffer, C<trailingData> will return everything from the end of the compressed data stream to the end of the buffer.

If the input is a filehandle, C<trailingData> will return the data that is left in the filehandle input buffer once the end of the compressed data stream has been reached. You can then use the filehandle to read the rest of the input file.

Don't bother using C<trailingData> if the input is a filename.

If

you know the length of the compressed data stream before you start uncompressing, you can avoid having to use C<trailingData> by setting the C<InputLength> option in the constructor.

=head1 Importing

No symbolic constants are required by this IO::Uncompress::RawInflate at present.

=over 5

=item :all

Imports C<rawinflate> and C<\$RawInflateError>.

Same as doing this

```
use IO::Uncompress::RawInflate qw(rawinflate $RawInflateError) ;
```

=back

=head1 NAME

IO::Compress::Bzip2 - Write bzip2 files/buffers

=head1 SYNOPSIS

```
use IO::Compress::Bzip2 qw(bzip2 $Bzip2Error) ;
```

```
my $status = bzip2 $input => $output [,OPTS]
    or die "bzip2 failed: $Bzip2Error\n";
```

```
my $z = new IO::Compress::Bzip2 $output [,OPTS]
    or die "bzip2 failed: $Bzip2Error\n";
```

```
$z->print($string);
$z->printf($format, $string);
$z->write($string);
$z->syswrite($string [, $length, $offset]);
$z->flush();
$z->tell();
$z->eof();
$z->seek($position, $whence);
$z->binmode();
$z->fileno();
$z->opened();
$z->autoflush();
$z->input_line_number();
$z->newStream( [OPTS] );
```

```
$z->close() ;
```

```
$Bzip2Error ;
```

```
# IO::File mode
```

```
print $z $string;
printf $z $format, $string;
tell $z
eof $z
seek $z, $position, $whence
binmode $z
```

```
fileno $z
close $z ;
```

## =head1 DESCRIPTION

This module provides a Perl interface that allows writing bzip2 compressed data to files or buffer.

For reading bzip2 files/buffers, see the companion module [L<IO::Uncompress::Bunzip2|IO::Uncompress::Bunzip2>](#).

## =head1 Functional Interface

A top-level function, `C<bzip2>`, is provided to carry out "one-shot" compression between buffers and/or files. For finer control over the compression process, see the [L<"OO Interface">](#) section.

```
use IO::Compress::Bzip2 qw(bzip2 $Bzip2Error) ;
```

```
bzip2 $input => $output [,OPTS]
    or die "bzip2 failed: $Bzip2Error\n";
```

The functional interface needs Perl5.005 or better.

## =head2 `bzip2 $input => $output [, OPTS]`

`C<bzip2>` expects at least two parameters, `C<$input>` and `C<$output>`.

### =head3 The `C<$input>` parameter

The parameter, `C<$input>`, is used to define the source of the uncompressed data.

It can take one of the following forms:

=over 5

=item A filename

If the `C<$input>` parameter is a simple scalar, it is assumed to be a filename. This file will be opened for reading and the input data will be read from it.

=item A filehandle

If the C<\$input> parameter is a filehandle, the input data will be read from it.

The string '-' can be used as an alias for standard input.

=item A scalar reference

If C<\$input> is a scalar reference, the input data will be read from C<\$\$input>.

=item An array reference

If C<\$input> is an array reference, each element in the array must be a filename.

The input data will be read from each file in turn.

The complete array will be walked to ensure that it only contains valid filenames before any data is compressed.

=item An Input FileGlob string

If C<\$input> is a string that is delimited by the characters "<" and ">" C<bzip2> will assume that it is an I<input fileglob string>. The input is the list of files that match the fileglob.

If the fileglob does not match any files ...

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$input> parameter is any other type, C<undef> will be returned.

=head3 The C<\$output> parameter

The parameter C<\$output> is used to control the destination of the compressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the compressed data will be written to it.

=item A filehandle

If the C<\$output> parameter is a filehandle, the compressed data will be written to it.

The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output> is a scalar reference, the compressed data will be stored in C<\$\$output>.

=item An Array Reference

If C<\$output> is an array reference, the compressed data will be pushed onto the array.

=item An Output FileGlob

If C<\$output> is a string that is delimited by the characters "<" and ">" C<bzip2> will assume that it is an I<output fileglob string>. The output is the list of files that match the fileglob.

When

C<\$output> is a fileglob string, C<\$input> must also be a fileglob string. Anything else is an error.

=back

If the C<\$output> parameter is any other type, C<undef> will be returned.

=head2 Notes

When C<\$input> maps to multiple files/buffers and C<\$output> is a single file/buffer the input files/buffers will be stored in C<\$output> as a concatenated series of compressed data streams.

=head2 Optional Parameters

Unless specified below, the optional parameters for C<bzip2>, C<OPTS>, are the same as those used with the OO interface defined in the L</"Constructor Options"> section below.

=over 5

=item C<< AutoClose => 0|1 >>

This option applies to any input or output data streams to C<bzip2> that are filehandles.

If C<AutoClose> is specified, and the value is true, it will result in all input and/or output filehandles being closed once C<bzip2> has completed.

This parameter defaults to 0.

=item C<< BinModeIn => 0|1 >>

When reading from a file or filehandle, set C<binmode> before reading.

Defaults to 0.

=item C<< Append => 0|1 >>

TODO

=back

=head2 Examples

To read the contents of the file C<file1.txt> and write the compressed data to the file C<file1.txt.bz2>.

```
use strict ;
use warnings ;
use IO::Compress::Bzip2 qw(bzip2 $Bzip2Error) ;
```

```
my $input = "file1.txt";
bzip2 $input => "$input.bz2"
    or die "bzip2 failed: $Bzip2Error\n";
```

To read from an existing Perl filehandle, C<\$input>, and write the compressed data to a buffer, C<\$buffer>.

```
use strict ;
use warnings ;
use IO::Compress::Bzip2 qw(bzip2 $Bzip2Error) ;
use IO::File ;
```

```
my $input = new IO::File "<file1.txt"
    or die "Cannot open 'file1.txt': $!\n" ;
my $buffer ;
bzip2 $input => \$buffer
    or die "bzip2 failed: $Bzip2Error\n";
```

To compress all files in the directory "/my/home" that match "\*.txt"

and store the compressed data in the same directory

```
use strict ;
use warnings ;
use IO::Compress::Bzip2 qw(bzip2 $Bzip2Error)
;

bzip2 '</my/home/*.txt>' => '<*.bz2>'
    or die "bzip2 failed: $Bzip2Error\n";
```

and if you want to compress each file one at a time, this will do the trick

```
use strict ;
use warnings ;
use IO::Compress::Bzip2 qw(bzip2 $Bzip2Error) ;

for my $input ( glob "/my/home/*.txt" )
{
    my $output = "$input.bz2" ;
    bzip2 $input => $output
        or die "Error compressing '$input': $Bzip2Error\n";
}
```

=head1 OO Interface

=head2 Constructor

The format of the constructor for C<IO::Compress::Bzip2> is shown below

```
my $z = new IO::Compress::Bzip2 $output [,OPTS]
    or die "IO::Compress::Bzip2 failed: $Bzip2Error\n";
```

It returns an C<IO::Compress::Bzip2> object on success and undef on failure.

The variable C<\$Bzip2Error> will contain an error message on failure.

If you are running Perl 5.005 or better the object, C<\$z>, returned from IO::Compress::Bzip2 can be used exactly like an L<IO::File|IO::File> filehandle.

This means

that all normal output file operations can be carried out with C<\$z>.

For example, to write to a compressed file/buffer you can use either of these forms

```
$z->print("hello world\n");
print $z "hello world\n";
```

The mandatory parameter C<\$output> is used to control the destination of the compressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the compressed data will be written to it.

=item A filehandle

If the C<\$output> parameter is a filehandle, the compressed data will be written to it.

The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output> is a scalar reference, the compressed data will be stored in C<\$\$output>.

=back

If the C<\$output> parameter is any other type, C<IO::Compress::Bzip2>::new will return undef.

=head2 Constructor Options

C<OPTS> is any combination of the following options:

=over 5

=item C<< AutoClose => 0|1 >>

This option is only valid when the C<\$output> parameter is a filehandle. If specified, and the value is true, it will result in the C<\$output> being closed once either the C<close> method is called or the C<IO::Compress::Bzip2> object is destroyed.

This parameter defaults to 0.

=item C<< Append => 0|1 >>

Opens C<\$output> in append mode.

The behaviour of this option is dependent on the type of C<\$output>.

=over 5

=item \* A Buffer

If C<\$output> is a buffer and C<Append> is enabled, all compressed data will be append to the end if C<\$output>. Otherwise C<\$output> will be cleared before any data is written to it.

=item \* A Filename

If C<\$output> is a filename and C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any compressed data is written to it.

=item \* A Filehandle

If C<\$output> is a filehandle, the file pointer will be positioned to the end of the file via a call to C<seek> before any compressed data is written to it. Otherwise the file pointer will not be moved.

=back

This parameter defaults to 0.

=item C<< BlockSize100K => number >>

Specify the number of 100K blocks bzip2 uses during compression.

Valid values are from 1 to 9, where 9 is best compression.

The default is 1.

=item C<< WorkFactor => number >>

Specifies how much effort bzip2 should take before resorting to a slower fallback compression algorithm.

Valid values range from 0 to 250, where 0 means use the default value 30.

The default is 0.

=item C<< Strict => 0|1 >>

This is a placeholder option.

=back

=head2 Examples

TODO

=head1 Methods

=head2 print

Usage is

```
$z->print($data)  
print $z $data
```

Compresses and outputs the contents of the C<\$data> parameter. This has the same behaviour as the C<print> built-in.

Returns true if successful.

=head2 printf

Usage is

```
$z->printf($format, $data)  
printf $z $format, $data
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns true if successful.

=head2 syswrite

Usage is

```
$z->syswrite $data  
$z->syswrite $data, $length  
$z->syswrite $data, $length, $offset
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns the number of uncompressed bytes written, or C<undef> if unsuccessful.

=head2 write

Usage is

```
$z->write $data  
$z->write $data, $length
```

`$z->write $data, $length, $offset`

Compresses and outputs the contents of the C<\$data> parameter.

Returns the number of uncompressed bytes written, or C<undef> if unsuccessful.

=head2 flush

Usage is

```
$z->flush;
```

Flushes any pending compressed data to the output file/buffer.

TODO

Returns true on success.

=head2 tell

Usage is

```
$z->tell()
tell $z
```

Returns the uncompressed file offset.

=head2 eof

Usage is

```
$z->eof();
eof($z);
```

Returns true if the C<close> method has been called.

=head2 seek

```
$z->seek($position, $whence);
seek($z,
$position, $whence);
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the output file/buffer.

It is a fatal error to attempt to seek backward.

Empty parts of the file/buffer will have NULL (0x00) bytes written to them.

The C<\$whence> parameter takes one the usual values, namely SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

=head2 binmode

Usage is

```
$z->binmode  
binmode $z ;
```

This is a noop provided for completeness.

=head2 opened

```
$z->opened()
```

Returns true if the object currently refers to a opened file/buffer.

=head2 autoflush

```
my $prev = $z->autoflush()  
my $prev = $z->autoflush(EXPR)
```

If the C<\$z> object is associated with a file or a filehandle, this method returns the current autoflush setting for the underlying filehandle. If C<EXPR> is present, and is non-zero, it will enable flushing after every write/print operation.

If C<\$z> is associated with a buffer, this method has no effect and always returns C<undef>.

B<Note> that the special variable C<\$|> B<cannot> be used to set or retrieve the autoflush setting.

=head2 input\_line\_number

```
$z->input_line_number()  
$z->input_line_number(EXPR)
```

This method always returns C<undef> when compressing.

=head2 fileno

```
$z->fileno()
```

`fileno($z)`

If the `C<$z>` object is associated with a file or a filehandle, `C<fileno>` will return the underlying file descriptor. Once the `C<close>` method is called `C<fileno>` will return `C<undef>`.

If the `C<$z>` object is associated with a buffer, this method will return `C<undef>`.

`=head2 close`

```
$z->close();  
close $z;
```

Flushes any pending compressed data and then closes the output file/buffer.

For most versions of Perl this method will be automatically invoked if the `IO::Compress::Bzip2` object is destroyed (either explicitly or by the variable with the reference to the object going out of scope). The exceptions are Perl versions 5.005 through 5.00504 and 5.8.0. In these cases, the `C<close>` method will be called automatically, but not until global destruction of all live objects when the program is terminating.

Therefore, if you want your scripts to be able to run on all versions of Perl, you should call `C<close>` explicitly and not rely on automatic closing.

Returns true on success, otherwise 0.

If the `C<AutoClose>` option has been enabled when the `IO::Compress::Bzip2` object was created, and the object is associated with a file, the underlying file will also be closed.

`=head2 newStream([OPTS])`

Usage is

```
$z->newStream( [OPTS] )
```

Closes the current compressed data stream and starts a new one.

`OPTS` consists of any of the the options that are available when creating the `C<$z>` object.

See the [L<"/>Constructor Options">](#) section for more details.

=head1 Importing

No symbolic constants are required by this `IO::Compress::Bzip2` at present.

=over 5

=item :all

Imports `C<bzip2>` and `C<$Bzip2Error>`.

Same as doing this

```
use IO::Compress::Bzip2
qw(bzip2 $Bzip2Error) ;
```

## =head1 NAME

IO::Compress::RawDeflate - Write RFC 1951 files/buffers

## =head1 SYNOPSIS

```
use IO::Compress::RawDeflate qw(rawdeflate $RawDeflateError) ;
```

```
my $status = rawdeflate $input => $output [,OPTS]  
or die "rawdeflate failed: $RawDeflateError\n";
```

```
my $z = new IO::Compress::RawDeflate $output [,OPTS]  
or die "rawdeflate failed: $RawDeflateError\n";
```

```
$z->print($string);  
$z->printf($format, $string);  
$z->write($string);  
$z->syswrite($string [, $length, $offset]);
```

```
$z->flush();
$z->tell();
$z->eof();
$z->seek($position, $whence);
$z->binmode();
$z->fileno();
$z->opened();
$z->autoflush();
$z->input_line_number();
$z->newStream( [OPTS] );
```

```
$z->deflateParams();
```

```
$z->close() ;
```

```
$RawDeflateError ;
```

```
# IO::File mode
```

```
print $z $string;
printf $z $format, $string;
tell $z
eof $z
seek $z, $position,
$whence
binmode $z
fileno $z
close $z ;
```

## =head1 DESCRIPTION

This module provides a Perl interface that allows writing compressed data to files or buffer as defined in RFC 1951.

Note that RFC 1951 data is not a good choice of compression format to use in isolation, especially if you want to auto-detect it.

For reading RFC 1951 files/buffers, see the companion module [L<IO::Uncompress::RawInflate|IO::Uncompress::RawInflate>](#).

## =head1 Functional Interface

A top-level function, `C<rawdeflate>`, is provided to carry out "one-shot" compression between buffers and/or files. For finer control over the compression process, see the [L<"/OO Interface">](#) section.

```
use IO::Compress::RawDeflate qw(rawdeflate $RawDeflateError) ;
```

```
rawdeflate $input_filename_or_reference => $output_filename_or_reference [,OPTS]  
or die "rawdeflate failed: $RawDeflateError\n";
```

The functional interface needs Perl5.005 or better.

```
=head2 rawdeflate $input_filename_or_reference => $output_filename_or_reference  
[, OPTS]
```

C<rawdeflate> expects at least two parameters,  
C<\$input\_filename\_or\_reference> and C<\$output\_filename\_or\_reference>.

```
=head3 The C<$input_filename_or_reference> parameter
```

The parameter, C<\$input\_filename\_or\_reference>, is used to define the source of the uncompressed data.

It can take one of the following forms:

```
=over 5
```

```
=item A filename
```

If the <\$input\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for reading and the input data will be read from it.

```
=item A filehandle
```

If the C<\$input\_filename\_or\_reference> parameter is a filehandle, the input data will be read from it. The string '-' can be used as an alias for standard input.

```
=item A scalar reference
```

If C<\$input\_filename\_or\_reference> is a scalar reference, the input data will be read from C<\$\$input\_filename\_or\_reference>.

```
=item An array reference
```

If C<\$input\_filename\_or\_reference> is an array reference, each element in the array must be a filename.

The input data will be read from each file in turn.

The complete array will be walked to ensure that it only

contains valid filenames before any data is compressed.

=item An Input FileGlob string

If C<\$input\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<rawdeflate> will assume that it is an I<input fileglob string>. The input is the list of files that match the fileglob.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$input\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head3 The C<\$output\_filename\_or\_reference> parameter

The parameter C<\$output\_filename\_or\_reference> is used to control the destination of the compressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the compressed data will be written to it.

=item A filehandle

If the C<\$output\_filename\_or\_reference> parameter is a filehandle, the compressed data will be written to it. The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output\_filename\_or\_reference> is a scalar reference, the compressed data will be stored in C<\$\$output\_filename\_or\_reference>.

=item An Array Reference

If C<\$output\_filename\_or\_reference> is an array reference, the compressed data will be pushed onto the array.

=item An Output FileGlob

If C<\$output\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<rawdeflate> will assume that it is an I<output fileglob string>. The output is the list of files that match the fileglob.

When C<\$output\_filename\_or\_reference> is an fileglob string, C<\$input\_filename\_or\_reference> must also be a fileglob string. Anything else is an error.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$output\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head2 Notes

When C<\$input\_filename\_or\_reference> maps to multiple files/buffers and C<\$output\_filename\_or\_reference> is a single file/buffer the input files/buffers will be stored in C<\$output\_filename\_or\_reference> as a concatenated series of compressed data streams.

=head2 Optional Parameters

Unless specified below, the optional parameters for C<rawdeflate>, C<OPTS>, are the same as those used with the OO interface defined in the L</"Constructor Options"> section below.

=over 5

=item C<< AutoClose => 0|1 >>

This option applies to any input or output data streams to C<rawdeflate> that are filehandles.

If C<AutoClose> is specified, and the value is true, it will result in all input and/or output filehandles being closed once C<rawdeflate> has completed.

This parameter defaults to 0.

=item C<< BinModeIn => 0|1 >>

When reading from a file or filehandle, set C<binmode> before reading.

Defaults

to 0.

=item C<< Append => 0|1 >>

The behaviour of this option is dependent on the type of output data stream.

=over 5

=item \* A Buffer

If C<Append> is enabled, all compressed data will be append to the end of the output buffer. Otherwise the output buffer will be cleared before any compressed data is written to it.

=item \* A Filename

If C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any compressed data is written to it.

=item \* A Filehandle

If C<Append> is enabled, the filehandle will be positioned to the end of the file via a call to C<seek> before any compressed data is written to it. Otherwise the file pointer will not be moved.

=back

When C<Append> is specified, and set to true, it will I<append> all compressed data to the output data stream.

So when the output is a filehandle it will carry out a seek to the eof before writing any compressed data. If the output is a filename, it will be opened for appending. If the output is a buffer, all compressed data will be appended to the existing buffer.

Conversely when C<Append> is not specified, or it is present and is set to false, it will operate as follows.

When the output is a filename, it will truncate the contents of the file before writing any compressed data. If the output is a filehandle its position will not be changed. If the output is a buffer, it will be wiped before any compressed data is output.

Defaults to 0.

=back

=head2 Examples

To read the contents of the file C<file1.txt> and write the compressed data to the file C<file1.txt.1951>.

```
use strict ;
use warnings ;
use IO::Compress::RawDeflate qw(rawdeflate $RawDeflateError) ;

my $input = "file1.txt";
rawdeflate $input => "$input.1951"
    or die "rawdeflate failed: $RawDeflateError\n";
```

To read from an existing Perl filehandle, C<\$input>, and write the compressed data to a buffer, C<\$buffer>.

```
use strict ;
use warnings
;
use IO::Compress::RawDeflate qw(rawdeflate $RawDeflateError) ;
use IO::File ;

my $input = new IO::File "<file1.txt"
    or die "Cannot open 'file1.txt': $!\n" ;
my $buffer ;
rawdeflate $input => \$buffer
    or die "rawdeflate failed: $RawDeflateError\n";
```

To compress all files in the directory "/my/home" that match "\*.txt" and store the compressed data in the same directory

```
use strict ;
use warnings ;
use IO::Compress::RawDeflate qw(rawdeflate $RawDeflateError) ;

rawdeflate '</my/home/*.txt>' => '<*.1951>'
    or die "rawdeflate failed: $RawDeflateError\n";
```

and if you want to compress each file one at a time, this will do the trick

```
use strict ;
use warnings ;
use IO::Compress::RawDeflate qw(rawdeflate $RawDeflateError) ;

for my $input ( glob "/my/home/*.txt" )
```

```

{
    my $output = "$input.1951" ;
    rawdeflate $input => $output
        or die "Error compressing '$input': $RawDeflateError\n";
}

```

=head1 OO Interface

=head2 Constructor

The format of the constructor for C<IO::Compress::RawDeflate> is shown below

```

my $z = new IO::Compress::RawDeflate $output [,OPTS]
    or die "IO::Compress::RawDeflate failed: $RawDeflateError\n";

```

It returns an C<IO::Compress::RawDeflate> object on success and undef on failure.

The variable C<\$RawDeflateError> will contain an error message on failure.

If you are running Perl 5.005 or better the object, C<\$z>, returned from IO::Compress::RawDeflate can be used exactly like an L<IO::File|IO::File> filehandle. This means that all normal output file operations can be carried out with C<\$z>.

For example, to write to a compressed file/buffer you can use either of these forms

```

$z->print("hello world\n");
print $z "hello world\n";

```

The mandatory parameter C<\$output> is used to control the destination of the compressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the compressed data will be written to it.

=item A filehandle

If the C<\$output> parameter is a filehandle, the compressed data will be written to it.

The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output> is a scalar reference, the compressed data will be stored in C<\$\$output>.

=back

If the C<\$output> parameter is any other type, C<IO::Compress::RawDeflate>::new will return undef.

=head2 Constructor Options

C<OPTS> is any combination of the following options:

=over 5

=item C<< AutoClose => 0|1 >>

This option is only valid when the C<\$output> parameter is a filehandle. If specified, and the value is true, it will result in the C<\$output> being closed once either the C<close> method is called or the C<IO::Compress::RawDeflate> object is destroyed.

This parameter defaults to 0.

=item C<< Append => 0|1 >>

Opens C<\$output> in append mode.

The behaviour of this option is dependent on the type of C<\$output>.

=over 5

=item \* A Buffer

If C<\$output> is a buffer and C<Append> is enabled, all compressed data will be append to the end of C<\$output>. Otherwise C<\$output> will be cleared before any data is written to it.

=item \* A Filename

If C<\$output> is a filename and C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any compressed data is written to it.

=item \* A Filehandle

If C<\$output> is a filehandle, the file pointer will be positioned to the

end of the file via a call to C<seek> before any compressed data is written to it. Otherwise the file pointer will not be moved.

=back

This parameter defaults to 0.

=item C<< Merge => 0|1 >>

This option is used to compress input data and append it to an existing compressed data stream in C<\$output>. The end result is a single compressed data stream stored in C<\$output>.

It is a fatal error to attempt to use this option when C<\$output> is not an RFC 1951 data stream.

There are a number of other limitations with the C<Merge> option:

=over 5

=item 1

This module needs to have been built with zlib 1.2.1 or better to work. A fatal error will be thrown if C<Merge> is used with an older version of zlib.

=item 2

If C<\$output> is a file or a filehandle, it must be seekable.

=back

This parameter defaults to 0.

=item -Level

Defines the compression level used by zlib. The value should either be a number between 0 and 9 (0 means no compression and 9 is maximum compression), or one of the symbolic constants defined below.

Z\_NO\_COMPRESSION  
Z\_BEST\_SPEED  
Z\_BEST\_COMPRESSION  
Z\_DEFAULT\_COMPRESSION

The default is Z\_DEFAULT\_COMPRESSION.

Note, these constants are not imported by `C<IO::Compress::RawDeflate>` by default.

```
use IO::Compress::RawDeflate qw(:strategy);
use IO::Compress::RawDeflate qw(:constants);
use IO::Compress::RawDeflate qw(:all);
```

=item -Strategy

Defines the strategy used to tune the compression. Use one of the symbolic constants defined below.

```
Z_FILTERED
Z_HUFFMAN_ONLY
Z_RLE
Z_FIXED
Z_DEFAULT_STRATEGY
```

The default is `Z_DEFAULT_STRATEGY`.

=item C<< Strict => 0|1 >>

This is a placeholder option.

=back

=head2 Examples

TODO

=head1 Methods

=head2 print

Usage is

```
$z->print($data)
print $z $data
```

Compresses and outputs the contents of the `C<$data>` parameter. This has the same behaviour as the `C<print>` built-in.

Returns true if successful.

=head2 printf

Usage is

```
$z->printf($format, $data)
printf $z $format, $data
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns true if successful.

=head2 syswrite

Usage is

```
$z->syswrite $data
$z->syswrite $data, $length
$z->syswrite $data, $length, $offset
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns the number of uncompressed bytes written, or C<undef> if unsuccessful.

=head2 write

Usage

is

```
$z->write $data
$z->write $data, $length
$z->write $data, $length, $offset
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns the number of uncompressed bytes written, or C<undef> if unsuccessful.

=head2 flush

Usage is

```
$z->flush;
$z->flush($flush_type);
```

Flushes any pending compressed data to the output file/buffer.

This method takes an optional parameter, C<\$flush\_type>, that controls how the flushing will be carried out. By default the C<\$flush\_type> used is C<Z\_FINISH>. Other valid values for C<\$flush\_type> are C<Z\_NO\_FLUSH>, C<Z\_SYNC\_FLUSH>, C<Z\_FULL\_FLUSH> and C<Z\_BLOCK>. It is strongly recommended that you only set the C<flush\_type> parameter if

you fully understand the implications of what it does - overuse of C<flush> can seriously degrade the level of compression achieved. See the C<zlib> documentation for details.

Returns true on success.

=head2 tell

Usage is

```
$z->tell()  
tell $z
```

Returns the uncompressed file offset.

=head2  
eof

Usage is

```
$z->eof();  
eof($z);
```

Returns true if the C<close> method has been called.

=head2 seek

```
$z->seek($position, $whence);  
seek($z, $position, $whence);
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the output file/buffer.

It is a fatal error to attempt to seek backward.

Empty parts of the file/buffer will have NULL (0x00) bytes written to them.

The C<\$whence> parameter takes one the usual values, namely SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

=head2 binmode

Usage is

```
$z->binmode  
binmode $z ;
```

This is a noop provided for completeness.

```
=head2 opened
```

```
$z->opened()
```

Returns true if the object currently refers to an opened file/buffer.

```
=head2 autoflush
```

```
my $prev = $z->autoflush()
```

```
my $prev = $z->autoflush(EXPR)
```

If the C<\$z> object is associated with a file or a filehandle, this method returns the current autoflush setting for the underlying filehandle. If

C<EXPR> is present, and is non-zero, it will enable flushing after every write/print operation.

If C<\$z> is associated with a buffer, this method has no effect and always returns C<undef>.

B<Note> that the special variable C<\$|> B<cannot> be used to set or retrieve the autoflush setting.

```
=head2 input_line_number
```

```
$z->input_line_number()
```

```
$z->input_line_number(EXPR)
```

This method always returns C<undef> when compressing.

```
=head2 fileno
```

```
$z->fileno()
```

```
fileno($z)
```

If the C<\$z> object is associated with a file or a filehandle, C<fileno> will return the underlying file descriptor. Once the C<close> method is called C<fileno> will return C<undef>.

If the C<\$z> object is associated with a buffer, this method will return C<undef>.

```
=head2 close
```

```
$z->close();
```

```
close $z;
```

Flushes any pending compressed data and then closes the output file/buffer.

For most versions of Perl this method will be automatically invoked if the `IO::Compress::RawDeflate` object is destroyed (either explicitly or by the variable with the reference to the object going out of scope). The exceptions are Perl versions 5.005 through 5.00504 and 5.8.0. In these cases, the `C<close>` method will be called automatically, but not until global destruction of all live objects when the program is terminating.

Therefore, if you want your scripts to be able to run on all versions of Perl, you should call `C<close>` explicitly and not rely on automatic closing.

Returns true on success, otherwise 0.

If the `C<AutoClose>` option has been enabled when the `IO::Compress::RawDeflate` object was created, and the object is associated with a file, the underlying file will also be closed.

```
=head2 newStream([OPTS])
```

Usage is

```
$z->newStream( [OPTS] )
```

Closes the current compressed data stream and starts a new one.

OPTS consists of any of the the options that are available when creating the `C<$z>` object.

See the [L<"/> section for more details.](#)

```
=head2 deflateParams
```

Usage  
is

```
$z->deflateParams
```

TODO

```
=head1 Importing
```

A number of symbolic constants are required by some methods in `C<IO::Compress::RawDeflate>`. None are imported by default.

=over 5

=item :all

Imports C<rawdeflate>, C<\$RawDeflateError> and all symbolic constants that can be used by C<IO::Compress::RawDeflate>. Same as doing this

```
use IO::Compress::RawDeflate qw(rawdeflate $RawDeflateError :constants) ;
```

=item :constants

Import all symbolic constants. Same as doing this

```
use IO::Compress::RawDeflate qw(:flush :level :strategy) ;
```

=item :flush

These symbolic constants are used by the C<flush> method.

```
Z_NO_FLUSH  
Z_PARTIAL_FLUSH  
Z_SYNC_FLUSH  
Z_FULL_FLUSH  
Z_FINISH  
Z_BLOCK
```

=item :level

These symbolic constants are used by the C<Level> option in the constructor.

```
Z_NO_COMPRESSION  
Z_BEST_SPEED  
Z_BEST_COMPRESSION  
Z_DEFAULT_COMPRESSION
```

=item :strategy

These symbolic constants are used by the C<Strategy> option in the constructor.

```
Z_FILTERED  
Z_HUFFMAN_ONLY  
Z_RLE  
Z_FIXED  
Z_DEFAULT_STRATEGY
```

tell $z
eof $z
seek $z, $position, $whence
binmode $z
fileno $z
close $z ;
```

=head1

## DESCRIPTION

This module provides a Perl interface that allows writing compressed data to files or buffer as defined in RFC 1952.

All the gzip headers defined in RFC 1952 can be created using this module.

For reading RFC 1952 files/buffers, see the companion module [L<IO::Uncompress::Gunzip|IO::Uncompress::Gunzip>](#).

=head1 Functional Interface

A top-level function, `C<gzip>`, is provided to carry out "one-shot" compression between buffers and/or files. For finer control over the compression process, see the [L<"/OO Interface">](#) section.

```
use IO::Compress::Gzip qw(gzip $GzipError) ;
```

```
gzip $input_filename_or_reference => $output_filename_or_reference [,OPTS]
    or die "gzip failed: $GzipError\n";
```

The functional interface needs Perl5.005 or better.

=head2 `gzip $input_filename_or_reference => $output_filename_or_reference [, OPTS]`

`C<gzip>` expects at least two parameters,  
`C<$input_filename_or_reference>` and `C<$output_filename_or_reference>`.

=head3 The `C<$input_filename_or_reference>`

parameter

The parameter, C<\$input\_filename\_or\_reference>, is used to define the source of the uncompressed data.

It can take one of the following forms:

=over 5

=item A filename

If the <\$input\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for reading and the input data will be read from it.

=item A filehandle

If the C<\$input\_filename\_or\_reference> parameter is a filehandle, the input data will be read from it. The string '-' can be used as an alias for standard input.

=item A scalar reference

If C<\$input\_filename\_or\_reference> is a scalar reference, the input data will be read from C<\$\$input\_filename\_or\_reference>.

=item An array reference

If C<\$input\_filename\_or\_reference> is an array reference, each element in the array must be a filename.

The input data will be read from each file in turn.

The complete array will be walked to ensure that it only contains valid filenames before any data is compressed.

=item

An Input FileGlob string

If C<\$input\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<gzip> will assume that it is an I<input fileglob string>. The input is the list of files that match the fileglob.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$input\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

In addition, if C<\$input\_filename\_or\_reference> is a simple filename, the default values for the C<Name> and C<Time> options will be sourced from that file.

If you do not want to use these defaults they can be overridden by explicitly setting the C<Name> and C<Time> options or by setting the C<Minimal> parameter.

=head3 The C<\$output\_filename\_or\_reference> parameter

The parameter C<\$output\_filename\_or\_reference> is used to control the destination of the compressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output\_filename\_or\_reference> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the compressed data will be written to it.

=item A filehandle

If the C<\$output\_filename\_or\_reference> parameter is a filehandle, the compressed data will be written to it. The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output\_filename\_or\_reference> is a scalar reference, the compressed data will be stored in C<\$\$output\_filename\_or\_reference>.

=item An Array Reference

If C<\$output\_filename\_or\_reference> is an array reference, the compressed data will be pushed onto the array.

=item An Output FileGlob

If C<\$output\_filename\_or\_reference> is a string that is delimited by the characters "<" and ">" C<gzip> will assume that it is an I<output fileglob string>. The output is the list of files that match the fileglob.

When C<\$output\_filename\_or\_reference> is an fileglob string, C<\$input\_filename\_or\_reference> must also be a fileglob string. Anything else is an error.

See L<File::GlobMapper|File::GlobMapper> for more details.

=back

If the C<\$output\_filename\_or\_reference> parameter is any other type, C<undef> will be returned.

=head2 Notes

When C<\$input\_filename\_or\_reference> maps to multiple files/buffers and C<\$output\_filename\_or\_reference> is a single file/buffer the input files/buffers will be stored in C<\$output\_filename\_or\_reference> as a concatenated series of compressed data streams.

=head2 Optional Parameters

Unless specified below, the optional parameters for C<gzip>, C<OPTS>, are the same as those used with the OO interface defined in the L</"Constructor Options"> section below.

=over 5

=item C<< AutoClose => 0|1 >>

This option applies to any input or output data streams to C<gzip> that are filehandles.

If C<AutoClose> is specified, and the value is true, it will result in all input and/or output filehandles being closed once C<gzip> has completed.

This parameter defaults to 0.

=item

C<< BinModeIn => 0|1 >>

When reading from a file or filehandle, set C<binmode> before reading.

Defaults to 0.

=item C<< Append => 0|1 >>

The behaviour of this option is dependent on the type of output data stream.

=over 5

=item \* A Buffer

If C<Append> is enabled, all compressed data will be append to the end of the output buffer. Otherwise the output buffer will be cleared before any compressed data is written to it.

=item \* A Filename

If C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any compressed data is written to it.

=item \* A Filehandle

If C<Append> is enabled, the filehandle will be positioned to the end of the file via a call to C<seek> before any compressed data is written to it. Otherwise the file pointer will not be moved.

=back

When C<Append> is specified, and set to true, it will I<append> all compressed data to the output data stream.

So when the output is a filehandle it will carry out a seek to the eof before writing any compressed data. If the output is a filename, it will be opened for appending. If the output is a buffer, all compressed data will be appended to the existing buffer.

Conversely when C<Append> is not specified, or it is present and is set to false, it will operate as follows.

When the output is a filename, it will truncate the contents of the file before writing any compressed data. If the output is a filehandle its position will not be changed. If the output is a buffer, it will be wiped before any compressed data is output.

Defaults to 0.

=back

=head2 Examples

To read the contents of the file C<file1.txt> and write the compressed data to the file C<file1.txt.gz>.

```
use strict ;
use warnings ;
use IO::Compress::Gzip qw(gzip $GzipError) ;

my $input = "file1.txt";
gzip $input => "$input.gz"
    or die "gzip failed: $GzipError\n";
```

To read from an existing Perl filehandle, C<\$input>, and write the compressed data to a buffer, C<\$buffer>.

```
use strict ;
use warnings ;
use IO::Compress::Gzip qw(gzip $GzipError) ;
use IO::File ;

my $input = new IO::File "<file1.txt"
    or die "Cannot open 'file1.txt': $!\n" ;
my $buffer ;
gzip $input => \$buffer
    or die "gzip failed: $GzipError\n";
```

To compress all files in the directory "/my/home" that match "\*.txt" and store the compressed data in the same directory

```
use strict ;
use warnings ;
use IO::Compress::Gzip qw(gzip $GzipError) ;

gzip '</my/home/*.txt>' => '<*.gz>'
    or die "gzip failed: $GzipError\n";
```

and if you want to compress each file one at a time, this will do the trick

```
use strict ;
use warnings ;
use IO::Compress::Gzip qw(gzip $GzipError) ;

for my $input ( glob "/my/home/*.txt" )
{
    my $output = "$input.gz" ;
    gzip $input => $output
        or die "Error compressing '$input': $GzipError\n";
}
```

=head1 OO Interface

=head2 Constructor

The

format of the constructor for C<IO::Compress::Gzip> is shown below

```
my $z = new IO::Compress::Gzip $output [,OPTS]
    or die "IO::Compress::Gzip failed: $GzipError\n";
```

It returns an C<IO::Compress::Gzip> object on success and undef on failure.

The variable C<\$GzipError> will contain an error message on failure.

If you are running Perl 5.005 or better the object, C<\$z>, returned from IO::Compress::Gzip can be used exactly like an L<IO::File|IO::File> filehandle.

This means that all normal output file operations can be carried out with C<\$z>.

For example, to write to a compressed file/buffer you can use either of these forms

```
$z->print("hello world\n");
print $z "hello world\n";
```

The mandatory parameter C<\$output> is used to control the destination of the compressed data. This parameter can take one of these forms.

=over 5

=item A filename

If the C<\$output> parameter is a simple scalar, it is assumed to be a filename. This file will be opened for writing and the compressed data will be written to it.

=item A filehandle

If the C<\$output> parameter is a filehandle, the compressed data will be written to it.

The string '-' can be used as an alias for standard output.

=item A scalar reference

If C<\$output> is a scalar reference, the compressed data will be stored in C<\$\$output>.

=back

If the C<\$output> parameter is any other type, C<IO::Compress::Gzip>::new will return undef.

=head2 Constructor Options

C<OPTS> is any combination of the following options:

=over 5

=item C<< AutoClose => 0|1 >>

This option is only valid when the C<\$output> parameter is a filehandle. If specified, and the value is true, it will result in the C<\$output> being closed once either the C<close> method is called or the C<IO::Compress::Gzip> object is destroyed.

This parameter defaults to 0.

=item C<< Append => 0|1 >>

Opens C<\$output> in append mode.

The behaviour of this option is dependent on the type of C<\$output>.

=over 5

=item \* A Buffer

If

C<\$output> is a buffer and C<Append> is enabled, all compressed data will be append to the end of C<\$output>. Otherwise C<\$output> will be cleared before any data is written to it.

=item \* A Filename

If C<\$output> is a filename and C<Append> is enabled, the file will be opened in append mode. Otherwise the contents of the file, if any, will be truncated before any compressed data is written to it.

=item \* A Filehandle

If C<\$output> is a filehandle, the file pointer will be positioned to the end of the file via a call to C<seek> before any compressed data is written to it. Otherwise the file pointer will not be moved.

=back

This parameter defaults to 0.

=item C<< Merge => 0|1 >>

This option is used to compress input data and append it to an existing compressed data stream in C<\$output>. The end result is a single compressed data stream stored in C<\$output>.

It is a fatal error to attempt to use this option when C<\$output> is not an RFC 1952 data stream.

There are a number of other limitations with the C<Merge> option:

=over 5

=item 1

This module needs to have been built with zlib 1.2.1 or better to work. A fatal error will be thrown if C<Merge> is used with an older version of zlib.

=item 2

If C<\$output> is a file or a filehandle, it must be seekable.

=back

This parameter defaults to 0.

=item -Level

Defines the compression level used by zlib. The value should either be a number between 0 and 9 (0 means no compression and 9 is maximum compression), or one of the symbolic constants defined below.

Z\_NO\_COMPRESSION  
Z\_BEST\_SPEED  
Z\_BEST\_COMPRESSION  
Z\_DEFAULT\_COMPRESSION

The default is Z\_DEFAULT\_COMPRESSION.

Note, these constants are not imported by C<IO::Compress::Gzip> by default.

```
use IO::Compress::Gzip qw(:strategy);  
use IO::Compress::Gzip qw(:constants);  
use IO::Compress::Gzip qw(:all);
```

=item -Strategy

Defines the strategy used to tune the compression. Use one of the symbolic constants defined below.

Z\_FILTERED  
Z\_HUFFMAN\_ONLY  
Z\_RLE  
Z\_FIXED  
Z\_DEFAULT\_STRATEGY

The default is Z\_DEFAULT\_STRATEGY.

=item C<< Minimal => 0|1 >>

If specified, this option will force the creation of the smallest possible compliant gzip header (which is exactly 10 bytes long) as defined in RFC 1952.

See the section titled "Compliance" in RFC 1952 for a definition of the values used for the fields in the gzip header.

All other parameters that control the content of the gzip header will be ignored if this parameter is set to 1.

This parameter defaults to 0.

=item C<< Comment => \$comment >>

Stores the contents of C<\$comment> in the COMMENT field in the gzip header.

By default, no comment field is written to the gzip file.

If the C<-Strict> option is enabled, the comment can only consist of ISO 8859-1 characters plus line feed.

If the C<-Strict> option is disabled, the comment field can contain any character except NULL. If any null characters are present, the field will be truncated at the first NULL.

=item

C<< Name => \$string >>

Stores the contents of C<\$string> in the gzip NAME header field. If C<Name> is not specified, no gzip NAME field will be created.

If the C<-Strict> option is enabled, C<\$string> can only consist of ISO

8859-1 characters.

If C<-Strict> is disabled, then C<\$string> can contain any character except NULL. If any null characters are present, the field will be truncated at the first NULL.

=item C<< Time => \$number >>

Sets the MTIME field in the gzip header to \$number.

This field defaults to the time the C<IO::Compress::Gzip> object was created if this option is not specified.

=item C<< TextFlag => 0|1 >>

This parameter controls the setting of the FLG.FTEXT bit in the gzip header. It is used to signal that the data stored in the gzip file/buffer is probably text.

The default is 0.

=item C<< HeaderCRC => 0|1 >>

When true this parameter will set the FLG.FHCRC bit to 1 in the gzip header and set the CRC16 header field to the CRC of the complete gzip header except the CRC16 field itself.

B<Note> that gzip files created with the C<HeaderCRC> flag set to 1 cannot be read by most, if not all, of the the standard gunzip utilities, most notably gzip version 1.2.4. You should therefore avoid using this option if you want to maximize the portability of your gzip files.

This parameter defaults to 0.

=item C<< OS\_Code => \$value >>

Stores C<\$value> in the gzip OS header field. A number between 0 and 255 is valid.

If not specified, this parameter defaults to the OS code of the Operating System this module was built on. The value 3 is used as a catch-all for all Unix variants and unknown Operating Systems.

=item C<< ExtraField => \$data >>

This parameter allows additional metadata to be stored in the ExtraField in the gzip header. An RFC 1952 compliant ExtraField consists of zero or more

subfields. Each subfield consists of a two byte header followed by the subfield data.

The list of subfields can be supplied in any of the following formats

```
-ExtraField => [$id1, $data1,  
                $id2, $data2,  
                ...  
                ]  
-ExtraField => [ [$id1 => $data1],  
                [$id2 => $data2],  
                ...  
                ]  
-ExtraField => { $id1 => $data1,  
                $id2 => $data2,  
                ...  
                }
```

Where C<\$id1>, C<\$id2> are two byte subfield ID's. The second byte of the ID cannot be 0, unless the C<Strict> option has been disabled.

If you use the hash syntax, you have no control over the order in which the ExtraSubFields are stored, plus you cannot have SubFields with duplicate ID.

Alternatively the list of subfields can be supplied as a scalar, thus

```
-ExtraField => $rawdata
```

If you use the raw format, and the C<Strict> option is enabled, C<IO::Compress::Gzip> will check that C<\$rawdata> consists of zero or more conformant sub-fields. When C<Strict> is disabled, C<\$rawdata> can consist of any arbitrary byte stream.

The  
maximum size of the Extra Field 65535 bytes.

```
=item C<< ExtraFlags => $value >>
```

Sets the XFL byte in the gzip header to C<\$value>.

If this option is not present, the value stored in XFL field will be determined by the setting of the C<Level> option.

If C<< Level => Z\_BEST\_SPEED >> has been specified then XFL is set to 2.

If C<< Level => Z\_BEST\_COMPRESSION >> has been specified then XFL is set to 4.

Otherwise XFL is set to 0.

=item C<< Strict => 0|1 >>

C<Strict> will optionally police the values supplied with other options to ensure they are compliant with RFC1952.

This option is enabled by default.

If C<Strict> is enabled the following behaviour will be policed:

=over 5

=item \*

The value supplied with the C<Name> option can only contain ISO 8859-1 characters.

=item \*

The value supplied with the C<Comment> option can only contain ISO 8859-1 characters plus line-feed.

=item \*

The values supplied with the C<-Name> and C<-Comment> options cannot contain multiple embedded nulls.

=item \*

If an C<ExtraField> option is specified and it is a simple scalar, it must conform to the sub-field structure as defined in RFC 1952.

=item \*

If an C<ExtraField> option is specified the second byte of the ID will be checked in each subfield to ensure that it does not contain the reserved value 0x00.

=back

When C<Strict> is disabled the following behaviour will be policed:

=over 5

=item \*

The value supplied with C<-Name> option can contain any character except NULL.

=item \*

The value supplied with C<-Comment> option can contain any character except NULL.

=item \*

The values supplied with the C<-Name> and C<-Comment> options can contain multiple embedded nulls. The string written to the gzip header will consist of the characters up to, but not including, the first embedded NULL.

=item \*

If an C<ExtraField> option is specified and it is a simple scalar, the structure will not be checked. The only error is if the length is too big.

=item \*

The ID header  
in an C<ExtraField> sub-field can consist of any two bytes.

=back

=back

=head2 Examples

TODO

=head1 Methods

=head2 print

Usage is

```
$z->print($data)  
print $z $data
```

Compresses and outputs the contents of the C<\$data> parameter. This has the same behaviour as the C<print> built-in.

Returns true if successful.

=head2 printf

Usage is

```
$z->printf($format, $data)
printf $z $format, $data
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns true if successful.

=head2 syswrite

Usage is

```
$z->syswrite $data
$z->syswrite $data, $length
$z->syswrite $data, $length, $offset
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns the number of uncompressed bytes written, or C<undef> if unsuccessful.

=head2 write

Usage is

```
$z->write $data
$z->write $data, $length
$z->write $data, $length, $offset
```

Compresses and outputs the contents of the C<\$data> parameter.

Returns the number of uncompressed bytes written,  
or C<undef> if  
unsuccessful.

=head2 flush

Usage is

```
$z->flush;
$z->flush($flush_type);
```

Flushes any pending compressed data to the output file/buffer.

This method takes an optional parameter, C<\$flush\_type>, that controls how the flushing will be carried out. By default the C<\$flush\_type> used is C<Z\_FINISH>. Other valid values for C<\$flush\_type> are C<Z\_NO\_FLUSH>, C<Z\_SYNC\_FLUSH>, C<Z\_FULL\_FLUSH> and C<Z\_BLOCK>. It is

strongly recommended that you only set the C<flush\_type> parameter if you fully understand the implications of what it does - overuse of C<flush> can seriously degrade the level of compression achieved. See the C<zlib> documentation for details.

Returns true on success.

=head2 tell

Usage is

```
$z->tell()  
tell $z
```

Returns the uncompressed file offset.

=head2 eof

Usage is

```
$z->eof();  
eof($z);
```

Returns true if the C<close> method has been called.

=head2 seek

```
$z->seek($position, $whence);  
seek($z, $position, $whence);
```

Provides a sub-set of the C<seek> functionality, with the restriction that it is only legal to seek forward in the output file/buffer. It is a fatal error to attempt to seek backward.

Empty parts of the file/buffer will have NULL (0x00) bytes written to them.

The C<\$whence> parameter takes one the usual values, namely SEEK\_SET, SEEK\_CUR or SEEK\_END.

Returns 1 on success, 0 on failure.

=head2 binmode

Usage is

```
$z->binmode  
binmode $z ;
```

This is a noop provided for completeness.

```
=head2 opened
```

```
$z->opened()
```

Returns true if the object currently refers to a opened file/buffer.

```
=head2 autoflush
```

```
my $prev = $z->autoflush()  
my $prev = $z->autoflush(EXPR)
```

If the C<\$z> object is associated with a file or a filehandle, this method returns the current autoflush setting for the underlying filehandle. If C<EXPR> is present, and is non-zero, it will enable flushing after every write/print operation.

If C<\$z> is associated with a buffer, this method has no effect and always returns C<undef>.

B<Note>

that the special variable C<\$|> B<cannot> be used to set or retrieve the autoflush setting.

```
=head2 input_line_number
```

```
$z->input_line_number()  
$z->input_line_number(EXPR)
```

This method always returns C<undef> when compressing.

```
=head2 fileno
```

```
$z->fileno()  
fileno($z)
```

If the C<\$z> object is associated with a file or a filehandle, C<fileno> will return the underlying file descriptor. Once the C<close> method is called C<fileno> will return C<undef>.

If the C<\$z> object is associated with a buffer, this method will return C<undef>.

```
=head2 close
```

```
$z->close() ;
```

```
close $z ;
```

Flushes any pending compressed data and then closes the output file/buffer.

For most versions of Perl this method will be automatically invoked if the `IO::Compress::Gzip` object is destroyed (either explicitly or by the variable with the reference to the object going out of scope). The exceptions are Perl versions 5.005 through 5.00504 and 5.8.0. In these cases, the `C<close>` method will be called automatically, but not until global destruction of all live objects when the program is terminating.

Therefore, if you want your scripts to be able to run on all versions of Perl, you should call `C<close>` explicitly and not rely on automatic closing.

Returns true on success, otherwise 0.

If the `C<AutoClose>` option has been enabled when the `IO::Compress::Gzip` object was created, and the object is associated with a file, the underlying file will also be closed.

```
=head2 newStream([OPTS])
```

Usage is

```
$z->newStream( [OPTS] )
```

Closes the current compressed data stream and starts a new one.

`OPTS` consists of any of the the options that are available when creating the `C<$z>` object.

See the [L</"Constructor Options">](#) section for more details.

```
=head2 deflateParams
```

Usage is

```
$z->deflateParams
```

TODO

```
=head1 Importing
```

A number of symbolic constants are required by some methods in `C<IO::Compress::Gzip>`. None are imported by default.

=over 5

=item :all

Imports C<gzip>,  
C<\$GzipError> and all symbolic  
constants that can be used by C<IO::Compress::Gzip>. Same as doing this

```
use IO::Compress::Gzip qw(gzip $GzipError :constants) ;
```

=item :constants

Import all symbolic constants. Same as doing this

```
use IO::Compress::Gzip qw(:flush :level :strategy) ;
```

=item :flush

These symbolic constants are used by the C<flush> method.

```
Z_NO_FLUSH  
Z_PARTIAL_FLUSH  
Z_SYNC_FLUSH  
Z_FULL_FLUSH  
Z_FINISH  
Z_BLOCK
```

=item :level

These symbolic constants are used by the C<Level> option in the constructor.

```
Z_NO_COMPRESSION  
Z_BEST_SPEED  
Z_BEST_COMPRESSION  
Z_DEFAULT_COMPRESSION
```

=item :strategy

These symbolic constants are used by the C<Strategy> option in the constructor.

```
Z_FILTERED  
Z_HUFFMAN_ONLY  
Z_RLE  
Z_FIXED  
Z_DEFAULT_STRATEGY
```

## =head1 EXIT CODES

If all your tests passed, Test::Builder will exit with zero (which is normal). If anything failed it will exit with how many failed. If you run less (or more) tests than you planned, the missing (or extras) will be considered failures. If no tests were ever run Test::Builder will throw a warning and exit with 255. If the test died, even after having successfully completed all its tests, it will still be considered a failure and will exit with 255.

So the exit codes are...

|                  |   |
|------------------|---|
| 0                | all tests successful                          |
| 255              | test died                                     |
| any other number | how many failed (including missing or extras) |

If you fail more than 254 tests, it will be reported as 254.

B<NOTE> This behavior may go away in future versions.

## =head1 CAVEATS and NOTES

=over 4

=item Backwards compatibility

Test::More works with Perls as old as 5.004\_05.

=item Overloaded objects

String overloaded

objects are compared B<as strings>. This prevents Test::More from piercing an object's interface allowing better blackbox testing. So if a function starts returning overloaded objects instead of bare strings your tests won't notice the difference. This is good.

However, it does mean that functions like is\_deeply() cannot be used to test the internals of string overloaded objects. In this case I would suggest Test::Deep which contains more flexible testing functions for complex data structures.

=item Threads

Test::More will only be aware of threads if "use threads" has been done I<before> Test::More is loaded. This is ok:

```
use threads;  
use Test::More;
```

This may cause problems:

```
use Test::More  
use threads;
```

=item Test::Harness upgrade

no\_plan and todo depend on new Test::Harness features and fixes. If you're going to distribute tests that use no\_plan or todo your end-users will have to upgrade Test::Harness to the latest one on CPAN. If you avoid no\_plan and TODO tests, the stock Test::Harness will work fine.

Installing Test::More should also upgrade Test::Harness.

=back

=head1 HISTORY

This is a case of convergent evolution with Joshua Pritikin's Test module. I was largely unaware of its existence when I'd first written my own ok() routines. This module exists because I can't

figure out how to easily wedge test names into Test's interface (along with a few other problems).

The goal here is to have a testing utility that's simple to learn, quick to use and difficult to trip yourself up with while still providing more flexibility than the existing Test.pm. As such, the names of the most common routines are kept tiny, special cases and magic side-effects are kept to a minimum. WYSIWYG.

=head1 SEE ALSO

L<Test::Simple> if all this confuses you and you just want to write some tests. You can upgrade to Test::More later (it's forward compatible).

L<Test> is the old testing module. Its main benefit is that it has been distributed with Perl since 5.004\_05.

L<Test::Harness> for details on how your test results are interpreted by Perl.

L<Test::Differences> for more ways to test complex data structures. And it plays well with Test::More.

L<Test::Class> is like XUnit but more perl-ish.

L<Test::Deep> gives you more powerful complex data structure testing.

L<Test::Unit> is XUnit style testing.

L<Test::Inline> shows the idea of embedded testing.

L<Bundle::Test> installs a whole bunch of useful test modules.

### NAME

WWW::RobotRules - database of robots.txt-derived permissions

### SYNOPSIS

```
use WWW::RobotRules;  
my $rules = WWW::RobotRules->new('MOMspider/1.0');
```

```
use LWP::Simple qw(get);
```

```
{
```

```

my $url = "http://some.place/robots.txt";
my $robots_txt = get $url;
$rules->parse($url, $robots_txt) if defined $robots_txt;
}

{
my $url = "http://some.other.place/robots.txt";
my $robots_txt = get $url;
$rules->parse($url, $robots_txt) if defined $robots_txt;
}

# Now we can check if a URL is valid for those servers
# whose "robots.txt" files we've gotten and parsed:
if($rules->allowed($url)) {
    $c = get $url;
    ...
}

```

## DESCRIPTION

This module parses /robots.txt files as specified in "A Standard for Robot Exclusion", at <http://www.robotstxt.org/wc/norobots.html>. Webmasters can use the /robots.txt file to forbid conforming robots from accessing parts of their web site.

The parsed files are kept in a WWW::RobotRules object, and this object provides methods to check if access to a given URL is prohibited. The same WWW::RobotRules object can be used for one or more parsed /robots.txt files on any number of hosts.

The following methods are provided:

`$rules = WWW::RobotRules->new($robot_name)`

This is the constructor for WWW::RobotRules objects. The first argument given to new() is the name of the robot.

`$rules->parse($robot_txt_url, $content, $fresh_until)`

The parse() method takes as arguments the URL that was used to retrieve the /robots.txt file, and the contents of the file.

`$rules->allowed($uri)`

Returns TRUE if this robot is allowed to retrieve this URL.

`$rules->agent([$name])`

Get/set the agent name. NOTE: Changing the agent name will clear the robots.txt rules and expire times out of the cache.

## ROBOTS.TXT

The format and semantics of the "/robots.txt" file are as follows (this is an edited abstract of <<http://www.robotstxt.org/wc/norobots.html>>):

The file consists of one or more records separated by one or more blank lines. Each record contains lines of the form

<field-name>: <value>

The field name is case insensitive. Text after the '#' character on a line is ignored during parsing. This is used for comments. The following <field-names> can be used:

#### User-Agent

The value of this field is the name of the robot the record is describing access policy for. If more than one \*User-Agent\* field is present the record describes an identical access policy for more than one robot. At least one field needs to be present per record. If the value is '\*', the record describes the default access policy for any robot that has not matched any of the other records.

The \*User-Agent\* fields must occur before the \*Disallow\* fields. If a record contains a \*User-Agent\* field after a \*Disallow\* field, that constitutes a malformed record. This parser will assume that a blank line should have been placed before that \*User-Agent\* field, and will break the record into two. All the fields before the \*User-Agent\* field will constitute a record, and the \*User-Agent\* field will be the first field in a new record.

#### Disallow

The value of this field specifies a partial URL that is not to be visited. This can be a full path, or a partial path; any URL that starts with this value will not be retrieved

Unrecognized records are ignored.

#### ROBOTS.TXT EXAMPLES

The following example "/robots.txt" file specifies that no robots should visit any URL starting with "/cyberworld/map/" or "/tmp/":

```
User-agent: *  
Disallow: /cyberworld/map/ # This is an infinite virtual URL space  
Disallow: /tmp/ # these will soon disappear
```

This example "/robots.txt" file specifies that no robots should visit any URL starting with "/cyberworld/map/", except the robot called "cybermapper":

```
User-agent: *
Disallow: /cyberworld/map/ # This is an infinite virtual URL space
```

```
# Cybermapper knows where to go.
User-agent: cybermapper
Disallow:
```

This example indicates that no robots should visit this site further:

```
# go away
User-agent: *
Disallow: /
```

This is an example of a malformed robots.txt file.

```
# robots.txt for ancientcastle.example.com
# I've locked myself away.
User-agent: *
Disallow: /
# The castle is your home now, so you can go anywhere you like.
User-agent: Belle
Disallow: /west-wing/ # except the west wing!
# It's good to be the Prince...
User-agent: Beast
Disallow:
```

This file is missing the required blank lines between records. However, the intention is clear.

=head1 NAME

WWW::RobotRules - database of robots.txt-derived permissions

=head1 SYNOPSIS

```
use WWW::RobotRules;
my $rules = WWW::RobotRules->new('MOMspider/1.0');

use LWP::Simple qw(get);

{
    my $url = "http://some.place/robots.txt";
    my $robots_txt = get $url;
    $rules->parse($url, $robots_txt) if defined $robots_txt;
}

{
    my $url = "http://some.other.place/robots.txt";
    my $robots_txt = get $url;
    $rules->parse($url, $robots_txt) if defined $robots_txt;
}

# Now we can check if a URL is valid for those servers
# whose "robots.txt" files we've gotten and parsed:
if($rules->allowed($url)) {
    $c = get $url;
    ...
}
```

=head1 DESCRIPTION

This module parses F</robots.txt> files as specified in "A Standard for Robot Exclusion", at <<http://www.robotstxt.org/wc/norobots.html>> Webmasters can use the F</robots.txt> file to forbid conforming robots from accessing parts of their web site.

The parsed files are kept in a WWW::RobotRules object, and this object provides methods to check if access to a given URL is prohibited. The same WWW::RobotRules object can be used for one or more parsed F</robots.txt> files on any number of hosts.

The following methods are provided:

=over 4

=item \$rules = WWW::RobotRules->new(\$robot\_name)

This is the constructor for WWW::RobotRules objects. The first argument given to new() is the name of the robot.

=item \$rules->parse(\$robot\_txt\_url, \$content, \$fresh\_until)

The parse() method takes as arguments the URL that was used to retrieve the F</robots.txt> file, and the contents of the file.

=item \$rules->allowed(\$uri)

Returns TRUE if this robot is allowed to retrieve this URL.

=item \$rules->agent([\$name])

Get/set the agent name. NOTE: Changing the agent name will clear the robots.txt rules and expire times out of the cache.

=head1 ROBOTS.TXT

The format and semantics of the "/robots.txt" file are as follows (this is an edited abstract of <a href="http://www.robotstxt.org/wc/norobots.html">http://www.robotstxt.org/wc/norobots.html</a>):

The file consists of one or more records separated by one or more blank lines. Each record contains lines of the form

<field-name>: <value>

The field name is case insensitive. Text after the '#' character on a line is ignored during parsing. This is used for comments. The following <field-names> can be used:

=over 3

=item User-Agent

The value of this field is the name of the robot the record is describing access policy for. If more than one I<User-Agent> field is present the record describes an identical access policy for more than one robot. At least one field needs to be present per record. If the value is '\*', the record describes the default access policy for any robot that has not not matched any of the other records.

The I<User-Agent> fields must occur before the I<Disallow> fields. If a record contains a I<User-Agent> field after a I<Disallow> field, that constitutes a malformed record. This parser will assume that a blank line should have been placed before that I<User-Agent> field, and will break the record into two. All the fields before the I<User-Agent> field will constitute a record, and the I<User-Agent> field will be the first field in a new record.

=item Disallow

The value of this field specifies a partial URL that is not to be visited. This can be a full path, or a partial path; any URL that starts with this value will not be retrieved

=back

Unrecognized records are ignored.

=head1 ROBOTS.TXT EXAMPLES

The following example "/robots.txt" file specifies that no robots should visit any URL starting with "/cyberworld/map/" or "/tmp/":

```
User-agent: *
Disallow: /cyberworld/map/ # This is an infinite virtual URL space
Disallow: /tmp/ # these will soon disappear
```

This example "/robots.txt" file specifies that no robots should visit any URL starting with "/cyberworld/map/", except the robot called "cybermapper":

```
User-agent: *
Disallow: /cyberworld/map/ # This is an infinite virtual URL space
```

```
# Cybermapper knows where to go.
User-agent: cybermapper
Disallow:
```

This example indicates that no robots should visit this site further:

```
# go away
User-agent: *
Disallow: /
```

This is an example of a malformed robots.txt file.

```
# robots.txt for ancientcastle.example.com
# I've locked myself away.
User-agent: *
Disallow: /
# The castle is your home now, so you can go anywhere you like.
User-agent: Belle
Disallow: /west-wing/ # except the west wing!
# It's good to be the Prince...
User-agent: Beast
Disallow:
```

This file is missing the required blank lines between records.  
However, the intention is clear.

Time::HiRes module: High resolution time, sleep, and alarm.

Implement usleep, ualarm, and gettimeofday for Perl, as well as wrappers to implement time, sleep, and alarm that know about non-integral seconds.

Note: the tests of this module are by definition time sensitive: under heavy loads the tests may fail. Reasonable relaxed criteria are being used for the tests but sometimes you may still see transient failures.

Rerun the tests (make test) a couple of times, preferably with less load on the testing machine.

Also, older versions of Perl do not support '-nolinenumbers' on the XSUBPP command, however, 5.004\_03 requires it (on my box, anyway) since the #line generating code in XSUBPP appears to have problems with #ifdef'd .xs code.

If xsubpp complains about usage when you do a make, look at the top of the Makefile.PL and comment out the "\$XSOPT=" line. Or upgrade to a

newer version of Perl.

POD documentation is embedded.

```

```
=head1 DESCRIPTION
```

The C<Time::HiRes> module implements a Perl interface to the C<usleep>, C<nanosleep>, C<ualarm>, C<gettimeofday>, and C<setitimer>/C<getitimer> system calls, in other words, high resolution time and timers. See the L<EXAMPLES> section below and the test scripts for usage; see your system documentation for the description of the underlying C<nanosleep> or C<usleep>, C<ualarm>, C<gettimeofday>, and C<setitimer>/C<getitimer> calls.

If your system lacks C<gettimeofday()> or an emulation of it you don't get C<gettimeofday()> or the one-argument form of C<tv\_interval()>.

If your system lacks all of C<nanosleep()>, C<usleep()>, C<select()>, and C<poll>, you don't get C<Time::HiRes::usleep()>, C<Time::HiRes::nanosleep()>, or C<Time::HiRes::sleep()>.

If your system lacks both C<ualarm()> and C<setitimer()> you don't get C<Time::HiRes::ualarm()> or C<Time::HiRes::alarm()>.

If you try to import an unimplemented function in the C<use> statement it will fail at compile time.

If your subsecond sleeping is implemented with C<nanosleep()> instead of C<usleep()>, you can mix subsecond sleeping with signals since C<nanosleep()> does not use signals. This, however, is not portable, and you should first check for the truth value of C<&Time::HiRes::d\_nanosleep> to see whether you have nanosleep, and then carefully read your C<nanosleep()> C API documentation for any peculiarities.

If you are using C<nanosleep> for something else than mixing sleeping with signals, give some thought to whether Perl is the tool you should be using for work requiring nanosecond accuracies.

Remember that unless you are working on a I<hard realtime> system, any clocks and timers will be imprecise, especially so if you are working in a pre-emptive multiuser system. Understand the difference between I<wallclock time> and process time (in UNIX-like systems the sum of

I<user> and I<system> times). Any attempt to sleep for X seconds will most probably end up sleeping B<more> than that, but don't be surprised if you end up sleeping slightly B<less>.

The following functions can be imported from this module.  
No functions are exported by default.

=over 4

=item gettimeofday ()

In array context returns a two-element array with the seconds and microseconds since the epoch. In scalar context returns floating seconds like C<Time::HiRes::time()> (see below).

=item usleep ( \$useconds )

Sleeps for the number of microseconds (millionths of a second) specified. Returns the number of microseconds actually slept. Can sleep for more than one second, unlike the C<usleep> system call. Can also sleep for zero seconds, which often works like a I<thread yield>. See also C<Time::HiRes::usleep()>, C<Time::HiRes::sleep()>, and C<Time::HiRes::clock\_nanosleep()>.

Do not expect usleep() to be exact down to one microsecond.

=item nanosleep ( \$nanoseconds )

Sleeps for the number of nanoseconds (1e9ths of a second) specified. Returns the number of nanoseconds actually slept (accurate only to microseconds, the nearest thousand of them). Can sleep for more than one second. Can also sleep for zero seconds, which often works like a I<thread yield>. See also C<Time::HiRes::sleep()>, C<Time::HiRes::usleep()>, and C<Time::HiRes::clock\_nanosleep()>.

Do not expect nanosleep() to be exact down to one nanosecond. Getting even accuracy of one thousand nanoseconds is good.

=item ualarm ( \$useconds [, \$interval\_useconds ] )

Issues a C<ualarm> call; the C<\$interval\_useconds> is optional and will be zero if unspecified, resulting in C<alarm>-like behaviour.

Returns

the remaining time in the alarm in microseconds, or C<undef> if an error occurred.

ualarm(0) will cancel an outstanding ualarm().

Note that the interaction between alarms and sleeps is unspecified.

=item tv\_interval

tv\_interval ( \$ref\_to\_gettimeofday [, \$ref\_to\_later\_gettimeofday] )

Returns the floating seconds between the two times, which should have been returned by C<gettimeofday()>. If the second argument is omitted, then the current time is used.

=item time ()

Returns a floating seconds since the epoch. This function can be imported, resulting in a nice drop-in replacement for the C<time> provided with core Perl; see the L</EXAMPLES> below.

B<NOTE 1>: This higher resolution timer can return values either less or more than the core C<time()>, depending on whether your platform rounds the higher resolution timer values up, down, or to the nearest second to get the core C<time()>, but naturally the difference should be never more than half a second. See also

L</clock\_getres>, if available  
in your system.

B<NOTE 2>: Since Sunday, September 9th, 2001 at 01:46:40 AM GMT, when the C<time()> seconds since epoch rolled over to 1\_000\_000\_000, the default floating point format of Perl and the seconds since epoch have conspired to produce an apparent bug: if you print the value of C<Time::HiRes::time()> you seem to be getting only five decimals, not six as promised (microseconds). Not to worry, the microseconds are there (assuming your platform supports such granularity in the first place). What is going on is that the default floating point format of Perl only outputs 15 digits. In this case that means ten digits before the decimal separator and five after. To see the microseconds you can use either C<printf>/C<sprintf> with C<".6f">, or the C<gettimeofday()> function in list context, which will give you the seconds and microseconds as two separate values.

=item sleep ( \$floating\_seconds )

Sleeps for the specified amount of seconds. Returns the number of seconds actually slept (a floating point value). This function can be imported, resulting in a nice drop-in replacement for the C<sleep> provided with perl, see the L</EXAMPLES> below.

Note that the interaction between alarms and sleeps is unspecified.

```
=item alarm ( $floating_seconds [, $interval_floating_seconds ] )
```

The C<SIGALRM> signal is sent after the specified number of seconds.

Implemented using C<setitimer()> if available, C<ualarm()> if not.

The C<\$interval\_floating\_seconds> argument is optional and will be zero if unspecified, resulting in C<alarm()>-like behaviour. This function can be imported, resulting in a nice drop-in replacement for the C<alarm> provided with perl, see the L</EXAMPLES> below.

Returns the remaining time in the alarm in seconds, or C<undef> if an error occurred.

B<NOTE 1>: With some combinations of operating systems and Perl releases C<SIGALRM> restarts C<select()>, instead of interrupting it.

This means that an C<alarm()> followed

by a C<select()> may together

take the sum of the times specified for the C<alarm()> and the C<select()>, not just the time of the C<alarm()>.

Note that the interaction between alarms and sleeps is unspecified.

```
=item setitimer ( $which, $floating_seconds [, $interval_floating_seconds ] )
```

Start up an interval timer: after a certain time, a signal (\$which) arrives, and more signals may keep arriving at certain intervals. To disable an "itimer", use C<\$floating\_seconds> of zero. If the C<\$interval\_floating\_seconds> is set to zero (or unspecified), the timer is disabled B<after> the next delivered signal.

Use of interval timers may interfere with C<alarm()>, C<sleep()>, and C<usleep()>. In standard-speak the "interaction is unspecified", which means that I<anything> may happen: it may work, it may not.

In scalar context, the remaining time in the timer is returned.

In list context, both the remaining time and the interval are returned.

There are usually three or four interval timers (signals) available: the

C<\$which> can be C<ITIMER\_REAL>, C<ITIMER\_VIRTUAL>, C<ITIMER\_PROF>, or C<ITIMER\_REALPROF>. Note that which ones are available depends: true UNIX platforms usually have the first three, but only Solaris seems to have C<ITIMER\_REALPROF> (which is used to profile multithreaded programs). Win32 unfortunately does not have interval timers.

C<ITIMER\_REAL> results in C<alarm()>-like behaviour. Time is counted in

I<real time>; that is, wallclock time. C<SIGALRM> is delivered when the timer expires.

C<ITIMER\_VIRTUAL> counts time in (process) I<virtual time>; that is, only when the process is running. In multiprocessor/user/CPU systems this may be more or less than real or wallclock time. (This time is also known as the I<user time>.) C<SIGVTALRM> is delivered when the timer expires.

C<ITIMER\_PROF> counts time when either the process virtual time or when the operating system is running on behalf of the process (such as I/O). (This time is also known as the I<system time>.) (The sum of user time and system time is known as the I<CPU time>.) C<SIGPROF> is delivered when the timer expires. C<SIGPROF> can interrupt system calls.

The semantics of interval timers for multithreaded programs are system-specific, and some systems may support additional interval timers. For example, it is unspecified which thread gets the signals. See your C<setitimer()> documentation.

=item getitimer ( \$which )

Return the remaining time in the interval timer specified by C<\$which>.

In scalar context, the remaining time is returned.

In list context, both the remaining time and the interval are returned. The interval is always what you put in using C<setitimer()>.

=item clock\_gettime ( \$which )

Return as seconds the current value of the POSIX high resolution timer specified by C<\$which>. All implementations that support POSIX high resolution timers are supposed to support at least the C<\$which> value of C<CLOCK\_REALTIME>, which is supposed to return results close to the results of C<gettimeofday>, or the number of seconds since 00:00:00:00 January 1, 1970 Greenwich Mean Time (GMT). Do not assume that CLOCK\_REALTIME is zero, it might be one, or something else. Another potentially useful (but not available everywhere) value is C<CLOCK\_MONOTONIC>, which guarantees a monotonically increasing time value (unlike time() or gettimeofday(), which can be adjusted). See your system documentation for other possibly supported values.

=item clock\_getres ( \$which )

Return as seconds the resolution of the POSIX high resolution timer

specified by C<\$which>. All implementations that support POSIX high resolution timers are supposed to support at least the C<\$which> value of C<CLOCK\_REALTIME>, see L</clock\_gettime>.

=item clock\_nanosleep ( \$which, \$nanoseconds, \$flags = 0)

Sleeps for the number of nanoseconds (1e9ths of a second) specified. Returns the number of nanoseconds actually slept. The \$which is the "clock id", as with clock\_gettime() and clock\_getres(). The flags default to zero but C<TIMER\_ABSTIME> can specified (must be exported explicitly) which means that C<\$nanoseconds> is not a time interval (as is the default) but instead an absolute time. Can sleep for more than one second. Can also sleep for zero seconds, which often works like a I<thread yield>. See also C<Time::HiRes::sleep()>, C<Time::HiRes::usleep()>, and C<Time::HiRes::nanosleep()>.

Do not expect clock\_nanosleep() to be exact down to one nanosecond. Getting even accuracy of one thousand nanoseconds is good.

=item clock()

Return as seconds the I<process time> (user + system time) spent by the process since the first call to clock() (the definition is B<not> "since the start of the process", though if you are lucky these times may be quite close to each other, depending on the system). What this means is that you probably need to store the result of your first call to clock(), and subtract that value from the following results of clock().

The time returned also includes the process times of the terminated child processes for which wait() has been executed. This value is somewhat like the second value returned by the times() of core Perl, but not necessarily identical. Note that due to backward compatibility limitations the returned value may wrap around at about 2147 seconds or at about 36 minutes.

=item stat

=item stat FH

=item stat EXPR

As L<perlfunc/stat> but with the access/modify/change file timestamps in subsecond resolution, if the operating system and the filesystem both support such timestamps. To override the standard stat():

```
use Time::HiRes qw(stat);
```

Test for the value of `&Time::HiRes::d_hires_stat` to find out whether the operating system supports subsecond file timestamps: a value larger than zero means yes. There are unfortunately no easy ways to find out whether the filesystem supports such timestamps. UNIX filesystems often do; NTFS does; FAT doesn't (FAT timestamp granularity is B<two> seconds).

A

zero return value of `&Time::HiRes::d_hires_stat` means that `Time::HiRes::stat` is a no-op passthrough for `CORE::stat()`, and therefore the timestamps will stay integers. The same thing will happen if the filesystem does not do subsecond timestamps, even if the `&Time::HiRes::d_hires_stat` is non-zero.

In any case do not expect nanosecond resolution, or even a microsecond resolution. Also note that the modify/access timestamps might have different resolutions, and that they need not be synchronized, e.g. if the operations are

```
write
stat # t1
read
stat # t2
```

the access time stamp from t2 need not be greater-than the modify time stamp from t1: it may be equal or I<less>.

=back

=head1 EXAMPLES

```
use Time::HiRes qw(usleep ualarm gettimeofday tv_interval);
```

```
$microseconds = 750_000;
usleep($microseconds);
```

```
# signal alarm in 2.5s & every .1s thereafter
ualarm(2_500_000, 100_000);
# cancel that ualarm
ualarm(0);
```

```
# get seconds and microseconds since the epoch
($s, $usec) = gettimeofday();
```

```
# measure elapsed time
# (could also do by subtracting 2 gettimeofday return values)
$t0 = [gettimeofday];
```

```

# do bunch of stuff here
$t1 = [gettimeofday];
# do more stuff here
$t0_t1 = tv_interval $t0, $t1;

$elapsed = tv_interval ($t0, [gettimeofday]);
$elapsed = tv_interval ($t0); # equivalent code

#
# replacements for time, alarm and sleep that know about
# floating seconds
#
use Time::HiRes;
$now_fractions = Time::HiRes::time;
Time::HiRes::sleep (2.5);
Time::HiRes::alarm (10.6666666);

use Time::HiRes qw ( time alarm sleep );
$now_fractions = time;
sleep (2.5);
alarm (10.6666666);

# Arm an interval timer to go off first at 10 seconds and
# after that every 2.5 seconds, in process virtual time

use Time::HiRes qw ( setitimer ITIMER_VIRTUAL time );

$SIG{VTALRM} = sub { print time, "\n" };
setitimer(ITIMER_VIRTUAL, 10, 2.5);

use Time::HiRes qw( clock_gettime clock_getres CLOCK_REALTIME );
# Read
the POSIX high resolution timer.
my $high = clock_getres(CLOCK_REALTIME);
# But how accurate we can be, really?
my $reso = clock_getres(CLOCK_REALTIME);

use Time::HiRes qw( clock_nanosleep TIMER_ABSTIME );
clock_nanosleep(CLOCK_REALTIME, 1e6);
clock_nanosleep(CLOCK_REALTIME, 2e9, TIMER_ABSTIME);

use Time::HiRes qw( clock );
my $clock0 = clock();
... # Do something.
my $clock1 = clock();
my $clockd = $clock1 - $clock0;

use Time::HiRes qw( stat );

```

```
my ($atime, $mtime, $ctime) = (stat("istics"))[8, 9, 10];
```

=head1 C API

In addition to the perl API described above, a C API is available for extension writers. The following C functions are available in the modglobal hash:

```
name          C prototype
-----
Time::NVtime  double (*)()
Time::U2time  void (*)(pTHX_ UV ret[2])
```

Both functions return equivalent information (like C<gettimeofday>) but with different representations. The names C<NVtime> and C<U2time> were selected mainly because they are operating system independent. (C<gettimeofday> is Unix-centric, though some platforms like Win32 and VMS have emulations for it.)

Here is an example of using C<NVtime> from C:

```
double (*myNVtime)(); /* Returns -1 on failure. */
SV **svp = hv_fetch(PL_modglobal, "Time::NVtime", 12, 0);
if (!svp) croak("Time::HiRes is required");
if (!SvIOK(*svp)) croak("Time::NVtime isn't a function pointer");
myNVtime = INT2PTR(double(*)(), SvIV(*svp));
printf("The current time is: %f\n", (*myNVtime)());
```

=head1 DIAGNOSTICS

=head2 useconds or interval more than ...

In ualarm() you tried to use number of microseconds or interval (also in microseconds) more than 1\_000\_000 and setitimer() is not available in your system to emulate that case.

=head2 negative time not invented yet

You tried to use a negative time argument.

=head2 internal error: useconds < 0 (unsigned ... signed ...)

Something went horribly wrong-- the number of microseconds that cannot become negative just became negative. Maybe your compiler is broken?

=head2 useconds or uinterval equal to or more than 1000000

In some platforms it is not possible to get an alarm with subsecond resolution and later than one second.

=head2 unimplemented in this platform

Some calls simply aren't available, real or emulated, on every platform.

=head1 CAVEATS

Notice that the core C<time()> maybe rounding rather than truncating. What this means is that the core C<time()> may be reporting the time as one second later than C<gettimeofday()> and C<Time::HiRes::time()>.

Adjusting the system clock (either manually or by services like ntp) may cause problems, especially for long running programs that assume a monotonously increasing time (note that all platforms do not adjust time as gracefully as UNIX ntp does). For example in Win32 (and derived platforms like Cygwin and MinGW) the Time::HiRes::time() may temporarily drift off from the system clock (and the original time())

by up to 0.5

seconds. Time::HiRes will notice this eventually and recalibrate.

Note that since Time::HiRes 1.77 the clock\_gettime(CLOCK\_MONOTONIC) might help in this (in case your system supports CLOCK\_MONOTONIC).

Some systems have APIs but not implementations: for example QNX and Haiku have the interval timer APIs but not the functionality.

# 1.537 perl-file-listing 6.04-7.el7

## 1.537.1 Available under license :

No license file was found, but licenses were detected in source scan.

### NAME

File::Listing - parse directory listing

### SYNOPSIS

```
use File::Listing qw(parse_dir);
$ENV{LANG} = "C"; # dates in non-English locales not supported
for (parse_dir('ls -l')) {
    ($name, $type, $size, $mtime, $mode) = @$_;
    next if $type ne 'f'; # plain file
    #...
}
```

```
# directory listing can also be read from a file
open(LISTING, "zcat ls-lR.gz|");
$dir = parse_dir(*LISTING, '+0000');
```

### DESCRIPTION

This module exports a single function called `parse_dir()`, which can be used to parse directory listings.

The first parameter to `parse_dir()` is the directory listing to parse. It can be a scalar, a reference to an array of directory lines or a glob representing a filehandle to read the directory listing from.

The second parameter is the time zone to use when parsing time stamps in the listing. If this value is undefined, then the local time zone is assumed.

The third parameter is the type of listing to assume. Currently supported formats are 'unix', 'apache' and 'dosftp'. The default value is 'unix'. Ideally, the listing type should be determined automatically.

The fourth parameter specifies how unparseable lines should be treated. Values can be 'ignore', 'warn' or a code reference. Warn means that the perl warn() function will be called. If a code reference is passed, then this routine will be called and the return value from it will be incorporated in the listing. The default is 'ignore'.

Only the first parameter is mandatory.

The return value from parse\_dir() is a list of directory entries. In a scalar context the return value is a reference to the list. The directory entries are represented by an array consisting of [ \$filename, \$filetype, \$filesize, \$filetime, \$filemode ]. The \$filetype value is one of the letters 'f', 'd', 'l' or '?'. The \$filetime value is the seconds since Jan 1, 1970. The \$filemode is a bitmask like the mode returned by stat().

=head1 NAME

HTTP::Cookies::Netscape - access to Netscape cookies files

=head1 SYNOPSIS

```
use LWP;
use HTTP::Cookies::Netscape;
$cookie_jar = HTTP::Cookies::Netscape->new(
    file => "c:/program files/netscape/users/ZombieCharity/cookies.txt",
);
my $browser = LWP::UserAgent->new;
$browser->cookie_jar( $cookie_jar );
```

## =head1 DESCRIPTION

This is a subclass of `C<HTTP::Cookies>` that reads (and optionally writes) Netscape/Mozilla cookie files.

See the documentation for `L<HTTP::Cookies>`.

## =head1 CAVEATS

Please note that the Netscape/Mozilla cookie file format can't store all the information available in the Set-Cookie2 headers, so you will probably lose some information if you save in this format.

At time of writing, this module seems to work fine with Mozilla Phoenix/Firebird.

## =head1 SEE ALSO

## NAME

`HTTP::Cookies` - HTTP cookie jars

## SYNOPSIS

```
use HTTP::Cookies;  
$cookie_jar = HTTP::Cookies->new(  
    file => "$ENV{'HOME'}/lwp_cookies.dat",  
    autosave => 1,  
);
```

```
use LWP;
```

```
my $browser = LWP::UserAgent->new;
$browser->cookie_jar($cookie_jar);
```

Or for an empty and temporary cookie jar:

```
use LWP;
my $browser = LWP::UserAgent->new;
$browser->cookie_jar( {} );
```

## DESCRIPTION

This class is for objects that represent a "cookie jar" -- that is, a database of all the HTTP cookies that a given LWP::UserAgent object knows about.

Cookies are a general mechanism which server side connections can use to both store and retrieve information on the client side of the connection. For more information about cookies refer to [URL:http://curl.haxx.se/rfc/cookie\\_spec.html](http://curl.haxx.se/rfc/cookie_spec.html) and [URL:http://www.cookiecentral.com/](http://www.cookiecentral.com/). This module also implements the new style cookies described in \*RFC 2965\*. The two variants of cookies are supposed to be able to coexist happily.

Instances of the class \*HTTP::Cookies\* are able to store a collection of Set-Cookie2: and Set-Cookie: headers and are able to use this information to initialize Cookie-headers in \*HTTP::Request\* objects. The state of a \*HTTP::Cookies\* object can be saved in and restored from files.

## METHODS

The following methods are provided:

```
$cookie_jar = HTTP::Cookies->new
```

The constructor takes hash style parameters. The following parameters are recognized:

file: name of the file to restore cookies from and save cookies to  
autosave: save during destruction (bool)  
ignore\_discard: save even cookies that are requested to be discarded (bool)  
hide\_cookie2: do not add Cookie2 header to requests

Future parameters might include (not yet implemented):

```
max_cookies      300
max_cookies_per_domain  20
max_cookie_size   4096
```

`no_cookies` list of domain names that we never return cookies to

`$cookie_jar->add_cookie_header( $request )`

The `add_cookie_header()` method will set the appropriate `Cookie:-header` for the `*HTTP::Request*` object given as argument. The `$request` must have a valid `url` attribute before this method is called.

`$cookie_jar->extract_cookies( $response )`

The `extract_cookies()` method will look for `Set-Cookie:` and `Set-Cookie2:` headers in the `*HTTP::Response*` object passed as argument. Any of these headers that are found are used to update the state of the `$cookie_jar`.

`$cookie_jar->set_cookie( $version, $key, $val, $path, $domain, $port, $path_spec, $secure, $maxage, $discard, \%rest )`

The `set_cookie()` method updates the state of the `$cookie_jar`. The `$key`, `$val`, `$domain`, `$port` and `$path` arguments are strings. The `$path_spec`, `$secure`, `$discard` arguments are boolean values. The `$maxage` value is a number indicating number of seconds that this cookie will live. A value `<= 0` will delete this cookie. `%rest` defines various other attributes like `"Comment"` and `"CommentURL"`.

`$cookie_jar->save`

`$cookie_jar->save( $file )`

This method file saves the state of the `$cookie_jar` to a file. The state can then be restored later using the `load()` method. If a filename is not specified we will use the name specified during construction. If the attribute `*ignore_discard*` is set, then we will even save cookies that are marked to be discarded.

The default is to save a sequence of `"Set-Cookie3"` lines. `"Set-Cookie3"` is a proprietary LWP format, not known to be compatible with any browser. The `*HTTP::Cookies::Netscape*` sub-class can be used to save in a format compatible with Netscape.

`$cookie_jar->load`

`$cookie_jar->load( $file )`

This method reads the cookies from the file and adds them to the `$cookie_jar`. The file must be in the format written by the `save()` method.

`$cookie_jar->revert`

This method empties the `$cookie_jar` and re-loads the `$cookie_jar` from the last save file.

`$cookie_jar->clear`

`$cookie_jar->clear( $domain )`

`$cookie_jar->clear( $domain, $path )`

`$cookie_jar->clear( $domain, $path, $key )`

Invoking this method without arguments will empty the whole `$cookie_jar`. If given a single argument only cookies belonging to that domain will be removed. If given two arguments, cookies belonging to the specified path within that domain are removed. If given three arguments, then the cookie with the specified key, path and domain is removed.

`$cookie_jar->clear_temporary_cookies`

Discard all temporary cookies. Scans for all cookies in the jar with either no expire field or a true `'discard'` flag. To be called when the user agent shuts down according to RFC 2965.

`$cookie_jar->scan( \&callback )`

The argument is a subroutine that will be invoked for each cookie stored in the `$cookie_jar`. The subroutine will be invoked with the following arguments:

- 0 version
- 1 key
- 2 val
- 3 path
- 4 domain
- 5 port
- 6 path\_spec
- 7 secure
- 8 expires
- 9 discard
- 10 hash

`$cookie_jar->as_string`

`$cookie_jar->as_string( $skip_discardables )`

The `as_string()` method will return the state of the `$cookie_jar` represented as a sequence of "Set-Cookie3" header lines separated by `"\n"`. If `$skip_discardables` is `TRUE`, it will not return lines for cookies with the `*Discard*` attribute.

=head1 NAME

HTTP::Cookies::Microsoft - access to Microsoft cookies files

=head1 SYNOPSIS

```
use LWP;
use HTTP::Cookies::Microsoft;
use Win32::TieRegistry(Delimiter => "/");
my $cookies_dir = $Registry->
    {"CUser/Software/Microsoft/Windows/CurrentVersion/Explorer/Shell Folders/Cookies"};

$cookie_jar = HTTP::Cookies::Microsoft->new(
    file    => "$cookies_dir\\index.dat",
    'delayload' => 1,
);
my $browser = LWP::UserAgent->new;
$browser->cookie_jar( $cookie_jar );
```

=head1 DESCRIPTION

This is a subclass of C<HTTP::Cookies> which loads Microsoft Internet Explorer 5.x and 6.x for Windows (MSIE) cookie files.

See the documentation for L<HTTP::Cookies>.

=head1 METHODS

The following methods are provided:

=over 4

=item \$cookie\_jar = HTTP::Cookies::Microsoft->new;

The constructor takes hash style parameters. In addition to the regular HTTP::Cookies parameters,

HTTP::Cookies::Microsoft recognizes the following:

delayload: delay loading of cookie data until a request

is actually made. This results in faster runtime unless you use most of the cookies since only the domain's cookie data is loaded on demand.

=back

=head1 CAVEATS

Please note that the code DOESN'T support saving to the MSIE cookie file format.

=head1 AUTHOR

=head1 NAME

HTTP::Cookies - HTTP cookie jars

=head1 SYNOPSIS

```
use HTTP::Cookies;
$cookie_jar = HTTP::Cookies->new(
    file => "$ENV{'HOME'}/lwp_cookies.dat",
    autosave => 1,
```

);

```
use LWP;  
my $browser = LWP::UserAgent->new;  
$browser->cookie_jar($cookie_jar);
```

Or for an empty and temporary cookie jar:

```
use LWP;  
my $browser = LWP::UserAgent->new;  
$browser->cookie_jar( {} );
```

=head1 DESCRIPTION

This class is for objects that represent a "cookie jar" -- that is, a database of all the HTTP cookies that a given LWP::UserAgent object knows about.

Cookies are a general mechanism which server side connections can use to both store and retrieve information on the client side of the connection. For more information about cookies refer to [URL:http://curl.haxx.se/rfc/cookie\\_spec.html](http://curl.haxx.se/rfc/cookie_spec.html) and [URL:http://www.cookiecentral.com/](http://www.cookiecentral.com/). This module also implements the new style cookies described in [RFC 2965](#).

The two variants of cookies are supposed to be able to coexist happily.

Instances of the class `I<HTTP::Cookies>` are able to store a collection of Set-Cookie2: and Set-Cookie: headers and are able to use this information to initialize Cookie-headers in `I<HTTP::Request>` objects. The state of a `I<HTTP::Cookies>` object can be saved in and restored from files.

=head1 METHODS

The following methods are provided:

=over 4

=item \$cookie\_jar = HTTP::Cookies->new

The constructor takes hash style parameters. The following parameters are recognized:

file: name of the file to restore cookies from and save cookies to  
autosave: save during destruction (bool)  
ignore\_discard: save even cookies that are requested to be discarded (bool)  
hide\_cookie2: do not add Cookie2 header to requests

Future parameters might include (not yet implemented):

```
max_cookies          300
max_cookies_per_domain 20
max_cookie_size      4096
```

```
no_cookies  list of domain names
              that we never return cookies to
```

```
=item $cookie_jar->add_cookie_header( $request )
```

The `add_cookie_header()` method will set the appropriate `Cookie:-header` for the `I<HTTP::Request>` object given as argument. The `$request` must have a valid `url` attribute before this method is called.

```
=item $cookie_jar->extract_cookies( $response )
```

The `extract_cookies()` method will look for `Set-Cookie:` and `Set-Cookie2:` headers in the `I<HTTP::Response>` object passed as argument. Any of these headers that are found are used to update the state of the `$cookie_jar`.

```
=item $cookie_jar->set_cookie( $version, $key, $val, $path, $domain, $port, $path_spec, $secure, $maxage,
$discard, \%rest )
```

The `set_cookie()` method updates the state of the `$cookie_jar`. The `$key`, `$val`, `$domain`, `$port` and `$path` arguments are strings. The `$path_spec`, `$secure`, `$discard` arguments are boolean values. The `$maxage` value is a number indicating number of seconds that this cookie will live. A value `<= 0` will delete this cookie. `%rest` defines various other attributes like `"Comment"` and `"CommentURL"`.

```
=item $cookie_jar->save
```

```
=item $cookie_jar->save( $file )
```

This method file saves the state of the `$cookie_jar` to a file. The state can then be restored later using the `load()` method. If a filename is not specified we will use the name specified during construction. If the attribute `I<ignore_discard>` is set, then we will even save cookies that are marked to be discarded.

The default is to save a sequence of `"Set-Cookie3"` lines. `"Set-Cookie3"` is a proprietary LWP format, not known to be compatible with any browser. The `I<HTTP::Cookies::Netscape>` sub-class can be used to save in a format compatible with Netscape.

```
=item $cookie_jar->load
```

```
=item $cookie_jar->load( $file )
```

This method reads the cookies from the file and adds them to the \$cookie\_jar. The file must be in the format written by the save() method.

```
=item $cookie_jar->revert
```

This method empties the \$cookie\_jar and re-loads the \$cookie\_jar from the last save file.

```
=item $cookie_jar->clear
```

```
=item $cookie_jar->clear( $domain )
```

```
=item $cookie_jar->clear( $domain, $path )
```

```
=item $cookie_jar->clear( $domain, $path, $key )
```

Invoking this method without arguments will empty the whole \$cookie\_jar. If given a single argument only cookies belonging to that domain will be removed. If given two arguments, cookies belonging to the specified path within that domain are removed. If given three arguments, then the cookie with the specified key, path and domain is removed.

```
=item $cookie_jar->clear_temporary_cookies
```

Discard all temporary cookies. Scans for all cookies in the jar with either no expire field or a true C<discard> flag. To be called when the user agent shuts down according to RFC 2965.

```
=item $cookie_jar->scan( \&callback )
```

The argument is a subroutine that will be invoked for each cookie stored in the \$cookie\_jar. The subroutine will be invoked with the following arguments:

- 0 version
- 1 key
- 2 val
- 3 path
- 4 domain

5 port  
6 path\_spec  
7 secure  
8 expires  
9 discard  
10 hash

=item \$cookie\_jar->as\_string

=item \$cookie\_jar->as\_string( \$skip\_discardables )

The as\_string() method will return the state of the \$cookie\_jar represented as a sequence of "Set-Cookie3" header lines separated by "\n". If \$skip\_discardables is TRUE, it will not return lines for cookies with the I<Discard> attribute.

### 1. Executive Summary

This document describes the MD5 message-digest algorithm. The algorithm takes as input a message of arbitrary length and produces as output a 128-bit "fingerprint" or "message digest" of the input. It is conjectured that it is computationally infeasible to produce two messages having the same message digest, or to produce any message having a given prespecified target message digest. The MD5 algorithm is intended for digital signature applications, where a large file must be "compressed" in a secure manner before being encrypted with a private (secret) key under a public-key cryptosystem such as RSA.

The MD5 algorithm is designed to be quite fast on 32-bit machines. In addition, the MD5 algorithm does not require any large substitution tables; the algorithm can be coded quite compactly.

The MD5 algorithm is an extension of the MD4 message-digest algorithm [1,2]. MD5 is slightly slower than MD4, but is more "conservative" in design. MD5 was designed because it was felt that MD4 was perhaps being adopted for use more quickly than justified by the existing critical review; because MD4 was designed to be exceptionally fast, it is "at the edge" in terms of risking successful cryptanalytic attack. MD5 backs off a bit, giving up a little in speed for a much greater likelihood of ultimate security. It incorporates some suggestions made by various reviewers, and contains additional optimizations. The MD5 algorithm is being placed in the public domain for review and possible adoption as a standard.

For OSI-based applications, MD5's object identifier is

```
md5 OBJECT IDENTIFIER ::=
    iso(1) member-body(2) US(840) rsadsi(113549) digestAlgorithm(2) 5 }
```

In the X.509 type AlgorithmIdentifier [3], the parameters for MD5 should have type NULL.

## 2. Terminology and Notation

In this document a "word" is a 32-bit quantity and a "byte" is an eight-bit quantity. A sequence of bits can be interpreted in a natural manner as a sequence of bytes, where each consecutive group of eight bits is interpreted as a byte with the high-order (most significant) bit of each byte listed first. Similarly, a sequence of bytes can be interpreted as a sequence of 32-bit words, where each consecutive group of four bytes is interpreted as a word with the low-order (least significant) byte given first.

Let  $x_i$  denote "x sub i". If the subscript is an expression, we surround it in braces, as in  $x_{i+1}$ . Similarly, we use  $^$  for superscripts (exponentiation), so that  $x^i$  denotes x to the i-th power.

Let the symbol "+" denote addition of words (i.e., modulo- $2^{32}$  addition). Let  $X \lll s$  denote the 32-bit value obtained by circularly shifting (rotating)  $X$  left by  $s$  bit positions. Let  $\text{not}(X)$  denote the bit-wise complement of  $X$ , and let  $X \vee Y$  denote the bit-wise OR of  $X$  and  $Y$ . Let  $X \oplus Y$  denote the bit-wise XOR of  $X$  and  $Y$ , and let  $XY$  denote the bit-wise AND of  $X$  and  $Y$ .

Rivest

[Page 2]

RFC 1321

MD5 Message-Digest Algorithm

April 1992

### 3. MD5 Algorithm Description

We begin by supposing that we have a  $b$ -bit message as input, and that we wish to find its message digest. Here  $b$  is an arbitrary nonnegative integer;  $b$  may be zero, it need not be a multiple of eight, and it may be arbitrarily large. We imagine the bits of the message written down as follows:

$$m_0 m_1 \dots m_{\{b-1\}}$$

The following five steps are performed to compute the message digest of the message.

#### 3.1 Step 1. Append Padding Bits

The message is "padded" (extended) so that its length (in bits) is congruent to 448, modulo 512. That is, the message is extended so that it is just 64 bits shy of being a multiple of 512 bits long. Padding is always performed, even if the length of the message is already congruent to 448, modulo 512.

Padding is performed as follows: a single "1" bit is appended to the message, and then "0" bits are appended so that the length in bits of the padded message becomes congruent to 448, modulo 512. In all, at least one bit and at most 512 bits are appended.

#### 3.2 Step 2. Append Length

A 64-bit representation of  $b$  (the length of the message before the padding bits were added) is appended

to the result of the previous step. In the unlikely event that  $b$  is greater than  $2^{64}$ , then only the low-order 64 bits of  $b$  are used. (These bits are appended as two 32-bit words and appended low-order word first in accordance with the previous conventions.)

At this point the resulting message (after padding with bits and with  $b$ ) has a length that is an exact multiple of 512 bits. Equivalently, this message has a length that is an exact multiple of 16 (32-bit words). Let  $M[0 \dots N-1]$  denote the words of the resulting message, where  $N$  is a multiple of 16.

### 3.3 Step 3. Initialize MD Buffer

A four-word buffer (A,B,C,D) is used to compute the message digest. Here each of A, B, C, D is a 32-bit register. These registers are initialized to the following values in hexadecimal, low-order bytes first):

Rivest

[Page 3]

RFC 1321

MD5 Message-Digest Algorithm

April 1992

word A: 01 23 45 67  
word B: 89 ab cd ef  
word C: fe dc ba 98  
word D: 76 54 32 10

### 3.4 Step 4. Process Message in 16-Word Blocks

We first define four auxiliary functions that each take as input three 32-bit words and produce as output one 32-bit word.

$$\begin{aligned} F(X,Y,Z) &= XY \vee \text{not}(X) Z \\ G(X,Y,Z) &= XZ \vee Y \text{not}(Z) \\ H(X,Y,Z) &= X \text{ xor } Y \text{ xor } Z \\ I(X,Y,Z) &= Y \text{ xor } (X \vee \text{not}(Z)) \end{aligned}$$

In each bit position  $F$  acts as a conditional: if  $X$  then  $Y$  else  $Z$ . The function  $F$  could have been defined using  $+$  instead of  $\vee$  since  $XY$  and  $\text{not}(X)Z$  will never have 1's in the same bit position.) It is interesting to note that if the bits of  $X$ ,  $Y$ , and  $Z$  are independent and unbiased, the each bit of  $F(X,Y,Z)$  will be independent and unbiased.

The functions G, H, and I are similar to the function F, in that they act in "bitwise parallel" to produce their output from the bits of X, Y, and Z, in such a manner that if the corresponding bits of X, Y, and Z are independent and unbiased, then each bit of G(X,Y,Z), H(X,Y,Z), and I(X,Y,Z) will be independent and unbiased. Note that the function H is the bit-wise "xor" or "parity" function of its inputs.

This step uses a 64-element table T[1 ... 64] constructed from the sine function. Let T[i] denote the i-th element of the table, which is equal to the integer part of 4294967296 times abs(sin(i)), where i is in radians. The elements of the table are given in the appendix.

Do the following:

```
/* Process each 16-word block. */
```

```
For i = 0 to N/16-1 do
```

```
  /* Copy block i into X. */
```

```
  For j = 0 to 15 do
```

```
    Set X[j] to M[i*16+j].
```

```
  end /* of loop on j */
```

```
/* Save A as AA, B as BB, C as CC, and D as DD. */
```

```
AA = A
```

```
BB = B
```

/* Then perform the following additions. (That is increment each
   of the four registers by the value it had before this block
   was started.) */
A = A + AA
B
= B + BB
C = C + CC
D = D + DD

end /* of loop on i */

```

The message digest produced as output is A, B, C, D. That is, we begin with the low-order byte of A, and end with the high-order byte of D.

This completes the description of MD5. A reference implementation in C is given in the appendix.

#### 4. Summary

The MD5 message-digest algorithm is simple to implement, and provides a "fingerprint" or message digest of a message of arbitrary length.

It is conjectured that the difficulty of coming up with two messages having the same message digest is on the order of  $2^{64}$  operations, and that the difficulty of coming up with any message having a given message digest is on the order of  $2^{128}$  operations. The MD5 algorithm has been carefully scrutinized for weaknesses. It is, however,

a

relatively new algorithm and further security analysis is of course justified, as is the case with any new proposal of this sort.

#### 5. Differences Between MD4 and MD5

The following are the differences between MD4 and MD5:

1. A fourth round has been added.
2. Each step now has a unique additive constant.
3. The function  $g$  in round 2 was changed from  $(XY \vee XZ \vee YZ)$  to  $(XZ \vee Y \text{ not}(Z))$  to make  $g$  less symmetric.
4. Each step now adds in the result of the previous step. This promotes a faster "avalanche effect".
5. The order in which input words are accessed in rounds 2 and 3 is changed, to make these patterns less like each other.
6. The shift amounts in each round have been approximately optimized, to yield a faster "avalanche effect." The shifts in different rounds are distinct.

## APPENDIX A - Reference Implementation

This appendix contains the following files taken from RSAREF: A Cryptographic Toolkit for Privacy-Enhanced Mail:

global.h -- global header file

md5.h -- header file for MD5

md5c.c -- source code for MD5

For more information on RSAREF, send email to <rsaref@rsa.com>.

The appendix also includes the following file:

mddriver.c -- test driver for MD2, MD4 and MD5

The driver compiles for MD5 by default but can compile for MD2 or MD4 if the symbol MD is defined on the C compiler command line as 2 or 4.

The implementation is portable and should work on many different platforms. However, it is not difficult to optimize the implementation on particular platforms, an exercise left to the reader. For example, on "little-endian" platforms where the lowest-addressed byte in a 32-bit word is the least significant and there are no alignment restrictions, the call to Decode in MD5Transform can be replaced with a typecast.

## A.1 global.h

```
/* GLOBAL.H - RSAREF types and constants
*/

/* PROTOTYPES should be set to one if and only if the compiler supports
function argument prototyping.
The following makes PROTOTYPES default to 0 if it has not already
```

## A.5 Test suite

The MD5 test suite (driver option "-x") should print the following results:

MD5 test suite:

MD5 ("") = d41d8cd98f00b204e9800998ecf8427e

MD5 ("a") = 0cc175b9c0f1b6a831c399e269772661

MD5 ("abc") = 900150983cd24fb0d6963f7d28e17f72

MD5 ("message digest") = f96b697d7cb7938d525a2f31aaf161d0

MD5 ("abcdefghijklmnopqrstuvwxyz") = c3fcd3d76192e4007dfb496cca67e13b

MD5 ("ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789") = d174ab98d277d9f5a5611c2c9f419d9f

MD5 ("12345678901234567890123456789012345678901234567890123456789012345678901234567890") = 57edf4a22be3c955ac49da2e2107b67a

## Security Considerations

The level of security discussed in this memo is considered to be sufficient for implementing very high security hybrid digital-signature schemes based on MD5 and a public-key cryptosystem.

=head1 NAME

Digest::MD5 - Perl interface to the MD5 Algorithm

=head1 SYNOPSIS

# Functional style

```
use Digest::MD5 qw(md5 md5_hex md5_base64);
```

```
$digest = md5($data);
```

```
$digest = md5_hex($data);
```

```
$digest = md5_base64($data);
```

# OO style

```
use Digest::MD5;
```

```
$ctx = Digest::MD5->new;
```

```
$ctx->add($data);
```

```
$ctx->addfile($file_handle);
```

```
$digest = $ctx->digest;
```

```
$digest = $ctx->hexdigest;
```

```
$digest = $ctx->b64digest;
```

=head1 DESCRIPTION

The C<Digest::MD5> module allows you to use the RSA Data Security Inc. MD5 Message Digest algorithm from within Perl programs. The algorithm takes as input a message of arbitrary length and produces as output a 128-bit "fingerprint" or "message digest" of the input.

Note that the MD5 algorithm is not as strong as it used to be. It has since 2005 been easy to generate different messages that produce the same MD5 digest. It still seems hard to generate messages that produce a given digest, but it is probably wise to move to stronger algorithms for applications that depend on the digest to uniquely identify a message.

The C<Digest::MD5> module provide a procedural interface for simple use, as well as an object oriented interface that can handle messages

of arbitrary length and which can read files directly.

## =head1 FUNCTIONS

The following functions are provided by the C<Digest::MD5> module. None of these functions are exported by default.

=over 4

=item md5(\$data,...)

This function will concatenate all arguments, calculate the MD5 digest of this "message", and return it in binary form. The returned string will be 16 bytes long.

The result of md5("a", "b", "c") will be exactly the same as the result of md5("abc").

=item md5\_hex(\$data,...)

Same as md5(), but will return the digest in hexadecimal form. The length of the returned string will be 32 and it will only contain characters from this set: '0'..'9' and 'a'..'f'.

=item md5\_base64(\$data,...)

Same as md5(),

but will return the digest as a base64 encoded string.

The length of the returned string will be 22 and it will only contain characters from this set: 'A'..'Z', 'a'..'z', '0'..'9', '+' and '/'.

Note that the base64 encoded string returned is not padded to be a multiple of 4 bytes long. If you want interoperability with other base64 encoded md5 digests you might want to append the redundant string "==" to the result.

=back

## =head1 METHODS

The object oriented interface to C<Digest::MD5> is described in this section. After a C<Digest::MD5> object has been created, you will add data to it and finally ask for the digest in a suitable format. A single object can be used to calculate multiple digests.

The following methods are provided:

=over 4

=item \$md5 = Digest::MD5->new

The constructor returns a new C<Digest::MD5> object which encapsulate the state of the MD5 message-digest algorithm.

If called as an instance method (i.e. \$md5->new) it will just reset the state the object to

the state of a newly created object. No new object is created in this case.

=item \$md5->reset

This is just an alias for \$md5->new.

=item \$md5->clone

This a copy of the \$md5 object. It is useful when you do not want to destroy the digests state, but need an intermediate value of the digest, e.g. when calculating digests iteratively on a continuous data stream. Example:

```
my $md5 = Digest::MD5->new;
while (<>) {
    $md5->add($_);
    print "Line $.: ", $md5->clone->hexdigest, "\n";
}
```

=item \$md5->add(\$data,...)

The \$data provided as argument are appended to the message we calculate the digest for. The return value is the \$md5 object itself.

All these lines will have the same effect on the state of the \$md5 object:

```
$md5->add("a"); $md5->add("b"); $md5->add("c");
$md5->add("a")->add("b")->add("c");
$md5->add("a", "b", "c");
$md5->add("abc");
```

=item \$md5->addfile(\$io\_handle)

The \$io\_handle will be read until EOF and its content appended to the message we calculate

the digest for. The return value is the \$md5 object itself.

The `addfile()` method will croak() if it fails reading data for some reason. If it croaks it is unpredictable what the state of the `$md5` object will be in. The `addfile()` method might have been able to read the file partially before it failed. It is probably wise to discard or reset the `$md5` object if this occurs.

In most cases you want to make sure that the `$io_handle` is in `C<binmode>` before you pass it as argument to the `addfile()` method.

```
=item $md5->add_bits($data, $nbits)
```

```
=item $md5->add_bits($bitstring)
```

Since the MD5 algorithm is byte oriented you might only add bits as multiples of 8, so you probably want to just use `add()` instead. The `add_bits()` method is provided for compatibility with other digest implementations. See `L<Digest>` for description of the arguments that `add_bits()` take.

```
=item $md5->digest
```

Return the binary digest for the message. The returned string will be 16 bytes long.

Note that the `C<digest>` operation is effectively a destructive, read-once operation. Once it has been performed, the `C<Digest::MD5>` object is automatically `C<reset>` and can be used to calculate another digest value. Call `$md5->clone->digest` if you want to calculate the digest without resetting the digest state.

```
=item $md5->hexdigest
```

Same as `$md5->digest`, but will return the digest in hexadecimal form. The length of the returned string will be 32 and it will only contain characters from this set: `'0'..'9'` and `'a'..'f'`.

```
=item $md5->b64digest
```

Same as `$md5->digest`, but will return the digest as a base64 encoded string. The length of the returned string will be 22 and it will only contain characters from this set: `'A'..'Z'`, `'a'..'z'`, `'0'..'9'`, `'+''` and `'/'`.

The base64 encoded string returned is not padded to be a multiple of 4 bytes long. If you want interoperability with other base64 encoded

md5 digests you might want to append the string "==" to the result.

=back

=head1 EXAMPLES

The simplest

way to use this library is to import the md5\_hex() function (or one of its cousins):

```
use Digest::MD5 qw(md5_hex);
print "Digest is ", md5_hex("foobarbaz"), "\n";
```

The above example would print out the message:

```
Digest is 6df23dc03f9b54cc38a0fc1483df6e21
```

The same checksum can also be calculated in OO style:

```
use Digest::MD5;

$md5 = Digest::MD5->new;
$md5->add('foo', 'bar');
$md5->add('baz');
$digest = $md5->hexdigest;

print "Digest is $digest\n";
```

With OO style, you can break the message arbitrarily. This means that we are no longer limited to have space for the whole message in memory, i.e. we can handle messages of any size.

This is useful when calculating checksum for files:

```
use Digest::MD5;

my $filename = shift || "/etc/passwd";
open (my $fh, '<', $filename) or die "Can't open '$filename': $!";
binmode($fh);

$md5 = Digest::MD5->new;
while (<$fh>) {
    $md5->add($_);
}
close($fh);
print $md5->b64digest,
```

```
" $filename\n";
```

Or we can use the `addfile` method for more efficient reading of the file:

```
use Digest::MD5;

my $filename = shift || "/etc/passwd";
open (my $fh, '<', $filename) or die "Can't open '$filename': $!";
binmode ($fh);

print Digest::MD5->new->addfile($fh)->hexdigest, " $filename\n";
```

Perl 5.8 support Unicode characters in strings. Since the MD5 algorithm is only defined for strings of bytes, it can not be used on strings that contains chars with ordinal number above 255. The MD5 functions and methods will croak if you try to feed them such input data:

```
use Digest::MD5 qw(md5_hex);

my $str = "abc\x{300}";
print md5_hex($str), "\n"; # croaks
# Wide character in subroutine entry
```

What you can do is calculate the MD5 checksum of the UTF-8 representation of such strings. This is achieved by filtering the string through `encode_utf8()` function:

```
use Digest::MD5 qw(md5_hex);
use Encode qw(encode_utf8);

my $str = "abc\x{300}";
print md5_hex(encode_utf8($str)), "\n";
# 8c2d46911f3f5a326455f0ed7a8ed3b3
```

## NAME

Carp - alternative warn and die for modules

## DESCRIPTION

The Carp routines are useful in your own modules because they act like die() or warn(), but with a message which is more likely to be useful to a user of your module. In the case of cluck, confess, and longmess that context is a summary of every call in the call-stack. For a shorter message you can use carp or croak which report the error as being from where your module was called. There is no guarantee that that is where the error was, but it is a good educated guess.

You can also alter the way the output and logic of Carp works, by changing some global variables in the Carp namespace.

## INSTALLATION

```
perl Makefile.PL  
make  
make test  
make install
```

## AUTHOR

The Carp module first appeared in Larry Wall's perl 5.000 distribution. Since then it has been modified by several of the perl 5 porters. Andrew Main (Zefram) <zefram@fysh.org> divested Carp into an independent distribution.

=head1 NAME

Carp - alternative warn and die for modules

=head1 SYNOPSIS

```
use Carp;
```

```
# warn user (from perspective of caller)
carp "string trimmed to 80 chars";
```

```
# die of errors (from perspective of caller)
croak "We're outta here!";
```

```
# die of errors with stack backtrace
confess "not implemented";
```

```
# cluck not exported by default
use Carp qw(cluck);
cluck "This is how we got here!";
```

=head1 DESCRIPTION

The Carp routines are useful in your own modules because they act like die() or warn(), but with a message which is more likely to be useful to a user of your module. In the case of cluck, confess, and longmess that context is a summary of every call in the call-stack. For a shorter message you can use C<carp> or C<croak> which report the error as being from where your module was called. There is no guarantee that that is where the error was, but it is a good educated guess.

You

can also alter the way the output and logic of C<Carp> works, by changing some global variables in the C<Carp> namespace. See the section on C<GLOBAL VARIABLES> below.

Here is a more complete description of how C<carp> and C<croak> work. What they do is search the call-stack for a function call stack where they have not been told that there shouldn't be an error. If every call is marked safe, they give up and give a full stack backtrace instead. In other words they presume that the first likely looking potential suspect is guilty. Their rules for telling whether a call shouldn't generate errors work as follows:

=over 4

=item 1.

Any call from a package to itself is safe.

=item 2.

Packages claim that there won't be errors on calls to or from packages explicitly marked as safe by inclusion in C<@CARP\_NOT>, or (if that array is empty) C<@ISA>. The ability to override what @ISA says is new in 5.8.

=item 3.

The trust in item 2 is transitive. If A trusts B, and B trusts C, then A trusts C. So if you do not override C<@ISA> with C<@CARP\_NOT>, then this trust relationship is identical to, "inherits from".

=item 4.

Any call from an internal Perl module is safe. (Nothing keeps user modules from marking themselves as internal to Perl, but this practice is discouraged.)

=item 5.

Any call to Perl's warning system (eg Carp itself) is safe. (This rule is what keeps it from reporting the error at the point where you call C<carp> or C<croak>.)

=item 6.

`C<$Carp::CarpLevel>` can be set to skip a fixed number of additional call levels. Using this is not recommended because it is very difficult to get it to behave correctly.

=back

=head2 Forcing a Stack Trace

As a debugging aid, you can force Carp to treat a croak as a confess and a carp as a cluck across I<all> modules. In other words, force a detailed stack trace to be given. This can be very helpful when trying to understand why, or from where, a warning or error is being generated.

This feature is enabled by 'importing' the non-existent symbol 'verbose'. You would typically enable it by saying

```
perl -MCarp=verbose script.pl
```

or by including the string `C<-MCarp=verbose>` in the PERL5OPT environment variable.

Alternately, you can set the global variable `C<$Carp::Verbose>` to true. See the C<GLOBAL VARIABLES> section below.

=head1 GLOBAL VARIABLES

=head2 `$Carp::MaxEvalLen`

This variable determines how many characters of a string-eval are to be shown in the output. Use a value of `C<0>` to show all text.

Defaults to `C<0>`.

=head2 `$Carp::MaxArgLen`

This variable determines how many characters of each argument to a function to print. Use a value of `C<0>` to show the full length of the argument.

Defaults to `C<64>`.

=head2 `$Carp::MaxArgNums`

This variable determines how many arguments to each function to show. Use a value of `C<0>` to show all arguments to a function call.

Defaults to C<8>.

```
=head2 $Carp::Verbose
```

This variable makes C<carp> and C<croak> generate stack backtraces just like

C<cluck> and C<confess>. This is how C<use Carp 'verbose'> is implemented internally.

Defaults to C<0>.

```
=head2 @CARP_NOT
```

This variable, I<in your package>, says which packages are I<not> to be considered as the location of an error. The C<carp()> and C<cluck()> functions will skip over callers when reporting where an error occurred.

NB: This variable must be in the package's symbol table, thus:

```
# These work
our @CARP_NOT; # file scope
use vars qw(@CARP_NOT); # package scope
@My::Package::CARP_NOT = ... ; # explicit package variable

# These don't work
sub xyz { ... @CARP_NOT = ... } # w/o declarations above
my @CARP_NOT; # even at top-level
```

Example of use:

```
package My::Carping::Package;
use Carp;
our @CARP_NOT;
sub bar { ... or _error('Wrong input') }
sub _error {
    # temporary control of where'ness, __PACKAGE__ is implicit
    local @CARP_NOT = qw(My::Friendly::Caller);
    carp(@_)
}
```

This would make C<Carp>

report the error as coming from a caller not

in C<My::Carping::Package>, nor from C<My::Friendly::Caller>.

Also read the L</DESCRIPTION> section above, about how C<Carp> decides where the error is reported from.

Use C<@CARP\_NOT>, instead of C<\$Carp::CarpLevel>.

Overrides C<Carp>'s use of C<@ISA>.

```
=head2 %Carp::Internal
```

This says what packages are internal to Perl. C<Carp> will never report an error as being from a line in a package that is internal to Perl. For example:

```
$Carp::Internal{ (__PACKAGE__) }++;  
# time passes...  
sub foo { ... or confess("whatever") };
```

would give a full stack backtrace starting from the first caller outside of `__PACKAGE__`. (Unless that package was also internal to Perl.)

```
=head2 %Carp::CarpInternal
```

This says which packages are internal to Perl's warning system. For generating a full stack backtrace this is the same as being internal to Perl, the stack backtrace will not start inside packages that are listed in C<%Carp::CarpInternal>.

But it is slightly different for the summary message generated by C<carp> or C<croak>. There errors will not be reported on any lines that are calling packages in C<%Carp::CarpInternal>.

For example C<Carp> itself is listed in C<%Carp::CarpInternal>. Therefore the full stack backtrace from C<confess> will not start inside of C<Carp>, and the short message from calling C<croak> is not placed on the line where C<croak> was called.

```
=head2 $Carp::CarpLevel
```

This variable determines how many additional call frames are to be skipped that would not otherwise be when reporting where an error occurred on a call to one of C<Carp>'s functions. It is fairly easy to count these call frames on calls that generate a full stack backtrace. However it is much harder to do this accounting for calls that generate a short message. Usually people skip too many call frames. If they are lucky they skip enough that C<Carp> goes all of the way through the call stack, realizes that something is wrong, and then generates a full stack backtrace. If they are unlucky then the error is reported from somewhere misleading very high in the call stack.

Therefore it is best to avoid C<\$Carp::CarpLevel>. Instead use C<@CARP\_NOT>, C<%Carp::Internal> and C<%Carp::CarpInternal>.

Defaults to C<0>.

=head1 BUGS

The Carp routines don't handle exception objects currently. If called with a first argument that is a reference, they simply call die() or warn(), as appropriate.

=head1 NAME

HTTP::Daemon - a simple http server class

=head1 SYNOPSIS

```
use HTTP::Daemon;
use HTTP::Status;

my $d = HTTP::Daemon->new || die;
print "Please contact me at: <URL:", $d->url, ">\n";
while (my $c = $d->accept) {
    while (my $r = $c->get_request) {
        if ($r->method eq 'GET' and $r->uri->path eq "/xyzyzy") {
            # remember, this is not recommended practice :-
            $c->send_file_response("/etc/passwd");
        }
        else {
            $c->send_error(RC_FORBIDDEN)
        }
    }
    $c->close;
    undef($c);
}
```

=head1 DESCRIPTION

Instances of the C<HTTP::Daemon> class are HTTP/1.1 servers that listen on a socket for incoming requests. The C<HTTP::Daemon> is a subclass of C<IO::Socket::INET>, so you can perform socket operations directly on it too.

The accept() method will return when a connection from a client is available. The returned value will be an C<HTTP::Daemon::ClientConn> object

which is another C<IO::Socket::INET> subclass. Calling the get\_request() method on this object will read data from the client and return an C<HTTP::Request> object. The ClientConn object also provide methods to send back various responses.

This HTTP daemon does not fork(2) for you. Your application, i.e. the user of the C<HTTP::Daemon> is responsible for forking if that is desirable. Also note that the user is responsible for generating responses that conform to the HTTP/1.1 protocol.

The following methods of C<HTTP::Daemon> are new (or enhanced) relative to the C<IO::Socket::INET> base class:

=over 4

=item \$d = HTTP::Daemon->new

=item \$d = HTTP::Daemon->new( %opts )

The constructor method takes the same arguments as the C<IO::Socket::INET> constructor, but unlike its base class it can also be called without any arguments. The daemon will then set up a listen queue of 5 connections and allocate some random port number.

A server that wants to bind to some specific address on the standard HTTP port will be constructed like this:

```
$d = HTTP::Daemon->new(  
    LocalAddr => 'www.thisplace.com',  
    LocalPort => 80,  
);
```

See L<IO::Socket::INET> for a description of other arguments that can be used to configure the daemon during construction.

=item \$c = \$d->accept

=item \$c = \$d->accept( \$pkg )

=item (\$c, \$peer\_addr) = \$d->accept

This method works the same as the one provided by the base class, but it returns an C<HTTP::Daemon::ClientConn> reference by default. If a package name is provided as argument, then the returned object will be blessed into the given class. It is probably a good idea to make that class a subclass of C<HTTP::Daemon::ClientConn>.

The accept method will return C<undef> if timeouts have been enabled and no connection is made within the given time. The timeout() method is described in L<IO::Socket>.

In list context both the client object and the peer address will be returned; see the description of the `accept` method

L<IO::Socket> for details.

=item \$d->url

Returns a URL string that can be used to access the server root.

=item \$d->product\_tokens

Returns the name that this server will use to identify itself. This is the string that is sent with the C<Server> response header. The main reason to have this method is that subclasses can override it if they want to use another product name.

The default is the string "libwww-perl-daemon/#.##" where "#.##" is replaced with the version number of this module.

=back

The C<HTTP::Daemon::ClientConn> is a C<IO::Socket::INET> subclass. Instances of this class are returned by the `accept()` method of C<HTTP::Daemon>. The following methods are provided:

=over 4

=item \$c->get\_request

=item \$c->get\_request( \$headers\_only )

This method reads data from the client and turns it into an C<HTTP::Request> object which is returned. It returns C<undef> if reading fails. If it fails, then the C<HTTP::Daemon::ClientConn> object (\$c) should be discarded, and you should not try call this method again on it. The `$c->reason` method might give you some information about why `$c->get_request` failed.

The `get_request()` method will normally not return until the whole request has been received from the client. This might not be what you want if the request is an upload of a large file (and with chunked transfer encoding HTTP can even support infinite request messages - uploading live audio for instance). If you pass a TRUE value as the `$headers_only` argument, then `get_request()` will return immediately after parsing the request headers and you are responsible for reading the rest of the request content. If you are going to call `$c->get_request` again on the same connection you better read the

correct number of bytes.

=item `$c->read_buffer`

=item `$c->read_buffer( $new_value )`

Bytes read by `$c->get_request`, but not used are placed in the I<read buffer>. The next time `$c->get_request` is called it will consume the bytes in this buffer before reading more data from the network connection itself. The read buffer is invalid after `$c->get_request` has failed.

If you handle the reading of the request content yourself you need to empty this buffer before you read more and you need to place unconsumed bytes here. You also need this buffer if you implement services like I<101 Switching Protocols>.

This method always returns the old buffer content and can optionally replace the buffer content if you pass it an argument.

=item `$c->reason`

When `$c->get_request` returns C<undef> you can obtain a short string describing why it happened by calling `$c->reason`.

=item `$c->proto_ge( $proto )`

Return TRUE if the client announced a protocol with version number greater or equal to the given argument. The `$proto` argument can be a string like "HTTP/1.1" or just "1.1".

=item `$c->antique_client`

Return TRUE if the client speaks the HTTP/0.9 protocol. No status code and no headers should be returned to such a client. This should be the same as `!$c->proto_ge("HTTP/1.0")`.

=item  
`$c->head_request`

Return TRUE if the last request was a C<HEAD> request. No content body must be generated for these requests.

=item `$c->force_last_request`

Make sure that `$c->get_request` will not try to read more requests off this connection. If you generate a response that is not self

delimiting, then you should signal this fact by calling this method.

This attribute is turned on automatically if the client announces protocol HTTP/1.0 or worse and does not include a "Connection: Keep-Alive" header. It is also turned on automatically when HTTP/1.1 or better clients send the "Connection: close" request header.

```
=item $c->send_status_line
```

```
=item $c->send_status_line( $code )
```

```
=item $c->send_status_line( $code, $mess )
```

```
=item $c->send_status_line( $code, $mess, $proto )
```

Send the status line back to the client. If \$code is omitted 200 is assumed. If \$mess is omitted, then a message corresponding to \$code is inserted. If \$proto is missing the content of the \$HTTP::Daemon::PROTO variable is used.

```
=item $c->send_crlf
```

Send the CRLF sequence to the client.

```
=item $c->send_basic_header
```

```
=item $c->send_basic_header( $code )
```

```
=item $c->send_basic_header( $code, $mess )
```

```
=item $c->send_basic_header( $code, $mess, $proto )
```

Send the status line and the "Date:" and "Server:" headers back to the client. This header is assumed to be continued and does not end with an empty CRLF line.

See the description of send\_status\_line() for the description of the accepted arguments.

```
=item $c->send_header( $field, $value )
```

```
=item $c->send_header( $field1, $value1, $field2, $value2, ... )
```

Send one or more header lines.

```
=item $c->send_response( $res )
```

Write a C<HTTP::Response> object to the client as a response. We try hard to make sure that the response is self delimiting so that the connection can stay persistent for further request/response exchanges.

The content attribute of the C<HTTP::Response> object can be a normal string or a subroutine reference.

If it is a subroutine, then whatever this callback routine returns is written back to the client as the response content. The routine will be called until it return an undefined or empty value. If the client is HTTP/1.1 aware then we will use chunked transfer encoding for the response.

```
=item $c->send_redirect( $loc )
```

```
=item $c->send_redirect( $loc, $code )
```

```
=item $c->send_redirect( $loc, $code, $entity_body )
```

Send a redirect response back to the client. The location (\$loc) can be an absolute or relative URL. The \$code must be one the redirect status codes, and defaults to "301 Moved Permanently"

```
=item $c->send_error
```

```
=item $c->send_error( $code )
```

```
=item $c->send_error( $code, $error_message )
```

Send an error response back to the client. If the \$code is missing a "Bad Request" error is reported. The \$error\_message is a string that is incorporated in the body of the HTML entity body.

```
=item $c->send_file_response( $filename )
```

Send back a response with the specified \$filename as content. If the file is a directory we try to generate an HTML index of it.

```
=item $c->send_file( $filename )
```

```
=item $c->send_file( $fd )
```

Copy the file to the client. The file can be a string (which will be interpreted as a filename) or a reference to an C<IO::Handle> or glob.

```
=item $c->daemon
```

Return a reference to the corresponding C<HTTP::Daemon> object.

NAME

HTTP::Daemon - a simple http server class

SYNOPSIS

```
use HTTP::Daemon;
use HTTP::Status;
```

```
my $d = HTTP::Daemon->new || die;
print "Please contact me at: <URL:", $d->url, ">\n";
while (my $c = $d->accept) {
```

```

while (my $r = $c->get_request) {
    if ($r->method eq 'GET' and $r->uri->path eq "/xyzy") {
        # remember, this is *not* recommended practice :-)
        $c->send_file_response("/etc/passwd");
    }
    else {
        $c->send_error(RC_FORBIDDEN)
    }
}
$c->close;
undef($c);
}

```

## DESCRIPTION

Instances of the ``HTTP::Daemon'` class are HTTP/1.1 servers that listen on a socket for incoming requests. The ``HTTP::Daemon'` is a subclass of ``IO::Socket::INET'`, so you can perform socket operations directly on it too.

The `accept()` method will return when a connection from a client is available. The returned value will be an ``HTTP::Daemon::ClientConn'` object which is another ``IO::Socket::INET'` subclass. Calling the `get_request()` method on this object will read data from the client and return an ``HTTP::Request'` object. The `ClientConn` object also provide methods to send back various responses.

This HTTP daemon does not `fork(2)` for you. Your application, i.e. the user of the ``HTTP::Daemon'` is responsible for forking if that is desirable. Also note that the user is responsible for generating responses that conform to the HTTP/1.1 protocol.

The following methods of ``HTTP::Daemon'` are new (or enhanced) relative to the ``IO::Socket::INET'` base class:

```
$d = HTTP::Daemon->new
```

```
$d = HTTP::Daemon->new( %opts )
```

The constructor method takes the same arguments as the ``IO::Socket::INET'` constructor, but unlike its base class it can also be called without any arguments.

The daemon will then set up a

listen queue of 5 connections and allocate some random port number.

A server that wants to bind to some specific address on the standard HTTP port will be constructed like this:

```

$d = HTTP::Daemon->new(
    LocalAddr => 'www.thisplace.com',

```

```
LocalPort => 80,  
);
```

See `IO::Socket::INET` for a description of other arguments that can be used to configure the daemon during construction.

```
$c = $d->accept
```

```
$c = $d->accept( $pkg )
```

```
( $c, $peer_addr ) = $d->accept
```

This method works the same as the one provided by the base class, but it returns an `HTTP::Daemon::ClientConn` reference by default. If a package name is provided as an argument, then the returned object will be blessed into the given class. It is probably a good idea to make that class a subclass of `HTTP::Daemon::ClientConn`.

The `accept` method will return `undef` if timeouts have been enabled and no connection is made within the given time. The `timeout()` method is described in `IO::Socket`.

In list context both the client object and the peer address will be returned; see the description of the `accept` method in `IO::Socket` for details.

```
$d->url
```

Returns a URL string that can be used to access the server root.

```
$d->product_tokens
```

Returns the name that this server will use to identify itself. This is the string that is sent with the `Server` response header. The main reason to have this method is that subclasses can override it if they want to use another product name.

The default is the string `"libwww-perl-daemon/#.##"` where `"#.##"` is replaced with the version number of this module.

The `HTTP::Daemon::ClientConn` is a `IO::Socket::INET` subclass. Instances of this class are returned by the `accept()` method of `HTTP::Daemon`. The following methods are provided:

```
$c->get_request
```

```
$c->get_request( $headers_only )
```

This method reads data from the client and turns it into an `HTTP::Request` object which is returned. It returns `undef` if reading fails. If it fails, then the `HTTP::Daemon::ClientConn` object (`$c`) should be discarded, and you should not try to call this method again on it. The `$c->reason` method might give you some

information about why `$c->get_request` failed.

The `get_request()` method will normally not return until the whole request has been received from the client. This might not be what you want if the request is an upload of a large file (and with chunked transfer encoding HTTP can even support infinite request messages - uploading live audio for instance). If you pass a `TRUE` value as the `$headers_only` argument, then `get_request()` will return immediately after parsing the request headers and you

are

responsible for reading the rest of the request content. If you are going to call `$c->get_request` again on the same connection you better read the correct number of bytes.

`$c->read_buffer`

`$c->read_buffer( $new_value )`

Bytes read by `$c->get_request`, but not used are placed in the `*read_buffer*`. The next time `$c->get_request` is called it will consume the bytes in this buffer before reading more data from the network connection itself. The read buffer is invalid after `$c->get_request` has failed.

If you handle the reading of the request content yourself you need to empty this buffer before you read more and you need to place unconsumed bytes here. You also need this buffer if you implement services like `*101 Switching Protocols*`.

This method always returns the old buffer content and can optionally replace the buffer content if you pass it an argument.

`$c->reason`

When `$c->get_request` returns ``undef`` you can obtain a short string describing why it happened by calling `$c->reason`.

`$c->proto_ge( $proto )`

Return `TRUE` if the client announced a protocol with version number greater or equal to the given argument. The `$proto` argument can be a string like `"HTTP/1.1"` or just `"1.1"`.

`$c->antique_client`

Return `TRUE` if the client speaks the HTTP/0.9 protocol. No status code and no headers should be returned to such a client. This should be the same as `!$c->proto_ge("HTTP/1.0")`.

`$c->head_request`

Return `TRUE` if the last request was a `'HEAD'` request. No content body must be generated for these requests.

`$c->force_last_request`

Make sure that `$c->get_request` will not try to read more requests off this connection. If you generate a response that is not self delimiting, then you should signal this fact by calling this method.

This attribute is turned on automatically if the client announces protocol HTTP/1.0 or worse and does not include a "Connection: Keep-Alive" header. It is also turned on automatically when HTTP/1.1 or better clients send the "Connection: close" request header.

`$c->send_status_line`

`$c->send_status_line( $code )`

`$c->send_status_line( $code, $mess )`

`$c->send_status_line( $code, $mess, $proto )`

Send the status line back to the client. If `$code` is omitted 200 is assumed. If `$mess` is omitted, then a message corresponding to `$code` is inserted. If `$proto` is missing the content of the `$HTTP::Daemon::PROTO` variable is used.

`$c->send_crlf`

Send the CRLF sequence to the client.

`$c->send_basic_header`

`$c->send_basic_header( $code )`

`$c->send_basic_header( $code, $mess )`

`$c->send_basic_header( $code, $mess, $proto )`

Send the status line and the "Date:" and "Server:" headers back to the client.

This header is assumed to be continued and does not end with an empty CRLF line.

See the description of `send_status_line()` for the description of the accepted arguments.

`$c->send_header( $field, $value )`

`$c->send_header( $field1, $value1, $field2, $value2, ... )`

Send one or more header lines.

`$c->send_response( $res )`

Write a ``HTTP::Response'` object to the client as a response. We try hard to make sure that the response is self delimiting so that the connection can stay persistent for further request/response exchanges.

The content attribute of the ``HTTP::Response'` object can be a normal string or a subroutine reference. If it is a subroutine, then whatever this callback routine returns is written back to the client

as the response content. The routine will be called until it return an undefined or empty value. If the client is HTTP/1.1 aware then we will use chunked transfer encoding for the response.

`$c->send_redirect( $loc )`

`$c->send_redirect( $loc, $code )`

`$c->send_redirect( $loc, $code, $entity_body )`

Send a redirect response back to the client. The location (`$loc`) can be an absolute or relative URL. The `$code` must be one the redirect status codes, and defaults to "301 Moved Permanently"

`$c->send_error`

`$c->send_error( $code )`

`$c->send_error( $code, $error_message )`

Send an error response back to the client. If the `$code` is missing a "Bad Request" error is reported. The `$error_message` is a string that is incorporated in the body of the HTML entity body.

`$c->send_file_response( $filename )`

Send back a response with the specified `$filename` as content. If the file is a directory we try to generate an HTML index of it.

`$c->send_file( $filename )`

`$c->send_file( $fd )`

Copy the file to the client. The file can be a string (which will be interpreted as a filename) or a reference to an `'IO::Handle'` or `glob`.

`$c->daemon`

Return a reference to the corresponding `'HTTP::Daemon'` object.

=head1 NAME

Encode::Supported -- Encodings supported by Encode

=head1 DESCRIPTION

=head2 Encoding Names

Encoding names are case insensitive. White space in names is ignored. In addition, an encoding may have aliases.

Each encoding has one "canonical" name. The "canonical" name is chosen from the names of the encoding by picking the first in the following sequence (with a few exceptions).

=over 2

=item \*

The name used by the Perl community. That includes 'utf8' and 'ascii'. Unlike aliases, canonical names directly reach the method so such frequently used words like 'utf8' don't need to do alias lookups.

=item \*

The MIME name as defined in IETF RFCs. This includes all "iso-"s.

=item \*

The name in the IANA registry.

=item \*

The name used by the organization that defined it.

=back

In case I<de jure> canonical names differ from that of the Encode module, they are always aliased if it ever be implemented.

So you can safely tell if a given encoding is implemented or not just by passing the canonical name.

Because of all the alias issues, and because in the general case encodings have state, "Encode" uses an encoding object internally once an operation is in progress.

=head1 Supported Encodings

As of Perl 5.8.0, at least the following encodings are recognized. Note that unless otherwise specified, they are all case insensitive (via alias) and all occurrence of spaces are replaced with '-'. In other words, "ISO 8859 1" and "iso-8859-1" are identical.

Encodings are categorized and implemented in several different modules but you don't have to C<use Encode::XX> to make them available for most cases. Encode.pm will automatically load those modules on demand.

=head2 Built-in Encodings

The following encodings are always available.

| Canonical | Aliases | Comments & References |
|-----------|---------|-----------------------|
|-----------|---------|-----------------------|

```

-----
ascii      US-ascii
ISO-646-US          [ECMA]
ascii-ctrl      Special Encoding
iso-8859-1 latin1          [ISO]
null           Special Encoding
utf8          UTF-8          [RFC2279]
-----

```

I<null> and I<ascii-ctrl> are special. "null" fails for all character so when you set fallback mode to PERLQQ, HTMLCREF or XMLCREF, ALL CHARACTERS will fall back to character references. Ditto for "ascii-ctrl" except for control characters. For fallback modes, see L<Encode>.

```
=head2 Encode::Unicode -- other Unicode encodings
```

Unicode coding schemes other than native utf8 are supported by Encode::Unicode, which will be autoloaded on demand.

```

-----
UCS-2BE   UCS-2, iso-10646-1          [IANA, UC]
UCS-2LE                               [UC]
UTF-16
                               [UC]
UTF-16BE                               [UC]
UTF-16LE                               [UC]
UTF-32                                   [UC]
UTF-32BE UCS-4                         [UC]
UTF-32LE                               [UC]
UTF-7                                   [RFC2152]
-----

```

To find how (UCS-2|UTF-(16|32))(LE|BE)? differ from one another, see L<Encode::Unicode>.

UTF-7 is a special encoding which "re-encodes" UTF-16BE into a 7-bit encoding. It is implemented separately by Encode::Unicode::UTF7.

```
=head2 Encode::Byte -- Extended ASCII
```

Encode::Byte implements most single-byte encodings except for Symbols and EBCDIC. The following encodings are based on single-byte encodings implemented as extended ASCII. Most of them map \x80-\xff (upper half) to non-ASCII characters.

```
=over 2
```

=item ISO-8859 and corresponding vendor mappings

Since there are so many, they are presented in table format with languages and corresponding encoding names by vendors. Note that the table is sorted in order of ISO-8859 and the corresponding vendor mappings are slightly different from that of ISO. See [L<http://czyborra.com/charsets/iso8859.html>](http://czyborra.com/charsets/iso8859.html) for details.

-----
```

[1] Esperanto, Maltese, and Turkish. Turkish is now on 8859-9.

[2] Baltics. Now on 8859-10, except for Latvian.

[3] TIS 620 + Non-Breaking Space (0xA0 / U+00A0)

[4] Nicknamed Latin0; the Euro sign as well as French and Finnish letters that are missing from 8859-1 were added.

All cp\* are also available as ibm-\*, ms-\*, and windows-\*. See also  
L<<http://czyborra.com/charsets/codepages.html>>.

Macintosh encodings don't seem to be registered in such entities as IANA. "Canonical" names in Encode are based upon Apple's Tech Note 1150. See L<<http://developer.apple.com/technotes/tn/tn1150.html>> for details.

=item KOI8 - De Facto Standard for the Cyrillic world

Though ISO-8859 does have ISO-8859-5, the KOI8 series is far more popular in the Net. L<Encode> comes with the following KOI charsets. For gory details, see  
L<<http://czyborra.com/charsets/cyrillic.html>>

```
-----  
koi8-f  
koi8-r cp878                [RFC1489]  
koi8-u                      [RFC2319]  
-----
```

=back

=head2 gsm0338 - Hentai Latin 1

GSM0338 is for GSM handsets. Though it shares alphanumerals with ASCII, control character ranges and other parts are mapped very differently, mainly to store Greek characters. There are also escape sequences (starting with 0x1B) to cover e.g. the Euro sign.

This was once handled by L<Encode::Bytes> but because of all those unusual specifications, Encode 2.20 has relocated the support to L<Encode::GSM0338>. See L<Encode::GSM0338> for details.

=over 2

=item gsm0338 support before 2.19

Some special cases like a trailing 0x00 byte or a lone 0x1B byte are not well-defined and decode()

will return an empty string for them.

One possible workaround is

```
$gsm =~ s/\x00\z/\x00\x00/;  
$uni = decode("gsm0338", $gsm);  
$uni .= "\xA0" if $gsm =~ /\x1B\z/;
```

Note that the Encode implementation of GSM0338 does not implement the reuse of Latin capital letters as Greek capital letters (for example, the 0x5A is U+005A (LATIN CAPITAL LETTER Z), not U+0396 (GREEK CAPITAL LETTER ZETA)).

The GSM0338 is also covered in Encode::Byte even though it is not an "extended ASCII" encoding.

=back

=head2 CJK: Chinese, Japanese, Korean (Multibyte)

Note that Vietnamese is listed above. Also read "Encoding vs Charset" below. Also note that these are implemented in distinct modules by countries, due to the size concerns (simplified Chinese is mapped to 'CN', continental China, while traditional Chinese is mapped to 'TW', Taiwan). Please refer to their respective documentation pages.

=over 2

=item Encode::EBCDIC

See L<perlebcdic> for details.

-----  
cp37  
cp500  
cp875  
cp1026  
cp1047  
posix-bc

-----  
=item Encode::Symbols

For symbols and dingbats.

-----  
symbol  
dingbats  
MacDingbats  
AdobeZdingbat  
AdobeSymbol

-----  
=item Encode::MIME::Header

Strictly speaking, MIME header encoding documented in RFC 2047 is more of encapsulation than encoding. However, their support in modern world is imperative so they are supported.

-----  
MIME-Header [RFC2047]  
MIME-B [RFC2047]  
MIME-Q [RFC2047]

-----  
=item Encode::Guess

This one is not a name of encoding but a utility that lets you pick up the most appropriate encoding for a data out of given I<suspects>. See L<Encode::Guess> for details.

=back

=head1 Unsupported encodings

The following encodings are not supported as yet; some because they are rarely used, some because of technical difficulties. They may be supported by external modules via CPAN in the future, however.

=over 2

=item ISO-2022-JP-2 [RFC1554]

Not very popular yet. Needs Unicode Database or equivalent to implement encode() (because it includes JIS X 0208/0212, KSC5601, and GB2312 simultaneously, whose code points in Unicode overlap. So you need to lookup the database to determine to what character set a given Unicode character should belong).

=item ISO-2022-CN [RFC1922]

Not very popular. Needs CNS 11643-1 and -2 which are not available in this module. CNS 11643 is supported (via euc-tw) in Encode::HanExtra. Autrijus Tang may add support for this encoding in his module in future.

=item Various HP-UX encodings

The following are unsupported due to the lack of mapping data.

'8' - arabic8, greek8, hebrew8, kana8, thai8, and turkish8

'15' - japanese15, korean15, and roi15

=item Cyrillic encoding ISO-IR-111

Anton Tagunov doubts its usefulness.

=item ISO-8859-8-1 [Hebrew]

None of the Encode team knows Hebrew enough (ISO-8859-8, cp1255 and MacHebrew are supported because and just because there were mappings

available at [L<http://www.unicode.org/>](http://www.unicode.org/)). Contributions welcome.

=item ISIRI 3342, Iran System, ISIRI 2900 [Farsi]

Ditto.

=item Thai encoding TCVN

Ditto.

=item Vietnamese encodings VPS

Though

Jungshik Shin has reported that Mozilla supports this encoding, it was too late before 5.8.0 for us to add it. In the future, it may be available via a separate module. See

[L<http://lxr.mozilla.org/seamoney/source/intl/uconv/ucvlatin/vps.uf>](http://lxr.mozilla.org/seamoney/source/intl/uconv/ucvlatin/vps.uf)  
and

[L<http://lxr.mozilla.org/seamoney/source/intl/uconv/ucvlatin/vps.ut>](http://lxr.mozilla.org/seamoney/source/intl/uconv/ucvlatin/vps.ut)  
if you are interested in helping us.

=item Various Mac encodings

The following are unsupported due to the lack of mapping data.

MacArmenian, MacBengali, MacBurmese, MacEthiopic  
MacExtArabic, MacGeorgian, MacKannada, MacKhmer  
MacLaotian, MacMalayalam, MacMongolian, MacOriya  
MacSinhalese, MacTamil, MacTelugu, MacTibetan  
MacVietnamese

The rest which are already available are based upon the vendor mappings at [L<http://www.unicode.org/Public/MAPPINGS/VENDORS/APPLE/>](http://www.unicode.org/Public/MAPPINGS/VENDORS/APPLE/).

=item (Mac) Indic encodings

The maps for the following are available at [L<http://www.unicode.org/>](http://www.unicode.org/) but remain unsupported because those encodings need an algorithmical approach, currently unsupported by F<enc2xs>:

MacDevanagari  
MacGurmukhi  
MacGujarati

For details, please see C<Unicode mapping issues and notes:> at [L<http://www.unicode.org/Public/MAPPINGS/VENDORS/APPLE/DEVANAGA.TXT>](http://www.unicode.org/Public/MAPPINGS/VENDORS/APPLE/DEVANAGA.TXT).

I believe this issue is prevalent not only for Mac Indic but also in other Indic encodings, but the above were the only Indic encodings maps that I could find at [L<http://www.unicode.org/>](http://www.unicode.org/) .

=back

=head1 Encoding vs. Charset -- terminology

We are used to using the term (character) I<encoding> and I<character set> interchangeably. But just as confusing the terms byte and character is dangerous and the terms should be differentiated when needed, we need to differentiate I<encoding> and I<character set>.

To understand that, here is a description of how we make computers grok our characters.

=over 2

=item \*

First we start with which characters to include. We call this collection of characters I<character repertoire>.

=item \*

Then we have to give each character a unique ID so your computer can tell the difference between 'a' and 'A'. This itemized character repertoire is now a I<character set>.

=item \*

If your computer can grow the character set without further processing, you can go ahead and use it. This is called a I<coded character set> (CCS) or I<raw character encoding>. ASCII is used this way for most cases.

=item \*

But in many cases, especially multi-byte CJK encodings, you have to tweak a little more. Your network connection may not accept any data with the Most Significant Bit set, and your computer may not be able to tell if a given byte is a whole character or just half of it. So you have to I<encode> the character set to use it.

A I<character encoding scheme> (CES) determines how to encode a given character set, or a set of multiple character sets. 7bit ISO-2022 is an example of a CES. You switch between character sets via I<escape

sequences>.

=back

Technically, or mathematically, speaking, a character set encoded in such a CES that maps character by character may form a CCS. EUC is such an example. The CES of EUC is as follows:

=over 2

=item \*

Map ASCII unchanged.

=item \*

Map such a character set that consists of 94 or 96 powered by N members by adding 0x80 to each byte.

=item \*

You can also use 0x8e and 0x8f to indicate that the following sequence of characters belongs to yet another character set. To each following byte is added the value 0x80.

=back

By carefully looking at the encoded byte sequence, you can find that the byte sequence conforms a unique number. In that sense, EUC is a CCS generated by a CES above from up to four CCS (complicated?). UTF-8 falls into this category. See [L<perlUnicode/"UTF-8">](#) to find out how UTF-8 maps Unicode to a byte sequence.

You may also have found out by now why 7bit ISO-2022 cannot comprise a CCS. If you look at a byte sequence `\x21\x21`, you can't tell if it is two '!'s or IDEOGRAPHIC SPACE. EUC maps the latter to `\xA1\xA1` so you have no trouble differentiating between "!!". and S<" ">.

=head1 Encoding Classification (by Anton Tagunov and Dan Kogai)

This section tries to classify the supported encodings by their applicability for information exchange over the Internet and to choose the most suitable aliases to name them in the context of such communication.

=over 2

=item \*

To (en|de)code encodings marked by C<(\*)>, you need C<Encode::HanExtra>, available from CPAN.

=back

Encoding names

US-ASCII UTF-8 ISO-8859-\* KOI8-R  
Shift\_JIS EUC-JP ISO-2022-JP ISO-2022-JP-1  
EUC-KR Big5 GB2312

are registered with IANA as preferred MIME names and may be used over the Internet.

C<Shift\_JIS> has been officialized by JIS X 0208:1997.  
L<Microsoft-related naming mess> gives details.

C<GB2312> is the IANA name for C<EUC-CN>.  
See L<Microsoft-related naming mess> for details.

C<GB\_2312-80> I<raw> encoding is available as C<gb2312-raw> with Encode. See L<Encode::CN> for details.

EUC-CN  
KOI8-U  
[RFC2319]

have not been registered with IANA (as of March 2002) but seem to be supported by major web browsers.  
The IANA name for C<EUC-CN> is C<GB2312>.

KS\_C\_5601-1987

is heavily misused.  
See L<Microsoft-related naming mess> for details.

C<KS\_C\_5601-1987> I<raw> encoding is available as C<kcs5601-raw> with Encode. See L<Encode::KR> for details.

UTF-16 UTF-16BE UTF-16LE

are IANA-registered C<charset>s. See [RFC 2781] for details.  
Jungshik Shin reports that UTF-16 with a BOM is well accepted by MS IE 5/6 and NS 4/6. Beware however that

=over 2

=item \*

C<UTF-16> support in any software you're going to be using/interoperating with has probably been less tested than C<UTF-8> support

=item \*

C<UTF-8> coded data seamlessly passes traditional command piping (C<cat>, C<more>, etc.) while C<UTF-16> coded data is likely to cause confusion (with its zero bytes, for example)

=item \*

it is beyond the power of words to describe the way HTML browsers encode non-C<ASCII> form data. To get a general impression, visit [L<http://www.alanflavell.org.uk/charset/form-i18n.html>](http://www.alanflavell.org.uk/charset/form-i18n.html). While encoding of form data has stabilized for C<UTF-8> encoded pages (at least IE 5/6, NS 6, and Opera 6 behave consistently), be sure to expect fun (and cross-browser discrepancies) with C<UTF-16> encoded pages!

=back

The rule of thumb is to use C<UTF-8> unless you know what you're doing and unless you really benefit from using C<UTF-16>.

ISO-IR-165 [RFC1345]

VISCII

GB 12345

GB 18030 (\*\*) (see links bellow)

EUC-TW (\*\*)

are totally valid encodings but not registered at IANA. The names under which they are listed here are probably the most widely-known names for these encodings and are recommended names.

BIG5PLUS (\*\*)

is a proprietary name.

=head2 Microsoft-related naming mess

Microsoft products misuse the following names:

=over 2

=item KS\_C\_5601-1987

Microsoft extension to C<EUC-KR>.

Proper names: C<CP949>, C<UHC>, C<x-windows-949> (as used by Mozilla).

See

L<<http://lists.w3.org/Archives/Public/ietf-charsets/2001AprJun/0033.html>>  
for details.

Encode aliases C<KS\_C\_5601-1987> to C<cp949> to reflect this common  
misusage. I<Raw> C<KS\_C\_5601-1987> encoding is available as  
C<kcs5601-raw>.

See L<Encode::KR> for details.

=item GB2312

Microsoft extension to C<EUC-CN>.

Proper names: C<CP936>, C<GBK>.

C<GB2312> has been registered in the C<EUC-CN> meaning at  
IANA. This has partially repaired the situation: Microsoft's  
C<GB2312> has become a superset of the official C<GB2312>.

Encode aliases C<GB2312> to C<euc-cn> in full agreement with  
IANA registration. C<cp936> is supported separately.  
I<Raw> C<GB\_2312-80> encoding is available as C<gb2312-raw>.

See L<Encode::CN> for details.

=item Big5

Microsoft extension to C<Big5>.

Proper name: C<CP950>.

Encode separately supports C<Big5> and C<cp950>.

=item Shift\_JIS

Microsoft's understanding of C<Shift\_JIS>.

JIS has not endorsed the full Microsoft standard however. The official C<Shift\_JIS> includes only JIS X 0201 and JIS X 0208 character sets, while Microsoft has always used C<Shift\_JIS> to encode a wider character repertoire. See C<IANA> registration for C<Windows-31J>.

As a historical predecessor, Microsoft's variant probably has more rights for the name, though it may be objected that Microsoft shouldn't have used JIS as part of the name in the first place.

Unambiguous name: C<CP932>. C<IANA> name (also used by Mozilla, and provided as an alias by Encode): C<Windows-31J>.

Encode separately supports C<Shift\_JIS> and C<cp932>.

=back

=head1 Glossary

=over 2

=item character repertoire

A collection of unique characters. A I<character> set in the strictest sense. At this stage, characters are not numbered.

=item coded character set (CCS)

A character set that is mapped in a way computers can use directly. Many character encodings, including EUC, fall in this category.

=item character encoding scheme (CES)

An algorithm to map a character set to a byte sequence.

You don't have to be able to tell which character set a given byte sequence belongs to. 7-bit ISO-2022 is a CES but it cannot be a CCS. EUC is an example of being both a CCS and CES.

=item charset (in MIME context)

has long been used in the meaning of C<encoding>, CES.

While the word combination C<character set> has lost this meaning in MIME context since [RFC 2130], the C<charset> abbreviation has retained it. This is how [RFC 2277] and [RFC 2278] bless C<charset>:

This document uses the term "charset" to mean a set of rules for mapping from a sequence of octets to a sequence of characters, such as the combination of a coded character set and a character encoding scheme; this is also what is used as an identifier in MIME "charset=" parameters, and registered in the IANA charset registry ... (Note that this is NOT a term used by other standards bodies, such as ISO). [RFC 2277]

=item EUC

Extended Unix Character. See ISO-2022.

=item ISO-2022

A CES that was carefully designed to coexist with ASCII. There are a 7 bit version and an 8 bit version.

The 7 bit version switches character set via escape sequence so it cannot form a CCS. Since this is more difficult to handle in programs than the 8 bit version, the 7 bit version is not very popular except for iso-2022-jp, the I<de facto> standard CES for e-mails.

The 8 bit version can form a CCS. EUC and ISO-8859 are two examples thereof. Pre-5.6 perl could use them as string literals.

=item UCS

Short for I<Universal Character Set>. When you say just UCS, it means I<Unicode>.

=item UCS-2

ISO/IEC 10646 encoding form: Universal Character Set coded in two octets.

=item Unicode

A character set that aims to include all character repertoires of the world. Many character sets in various national as well as industrial standards have become, in a way, just subsets of Unicode.

=item UTF

Short for I<Unicode Transformation Format>. Determines how to map a Unicode character into a byte sequence.

=item  
UTF-16

A UTF in 16-bit encoding. Can either be in big endian or little endian. The big endian version is called UTF-16BE (equal to UCS-2 + surrogate support) and the little endian version is called UTF-16LE.

=head1 NAME

Encode - character encodings in Perl

=head1 SYNOPSIS

```
use Encode qw(decode encode);
$characters = decode('UTF-8', $octets, Encode::FB_CROAK);
$octets     = encode('UTF-8', $characters, Encode::FB_CROAK);
```

=head2 Table of Contents

Encode consists of a collection of modules whose details are too extensive to fit in one document. This one itself explains the top-level APIs and general topics at a glance. For other topics and more details, see the documentation for these modules:

=over 2

=item L<Encode::Alias> - Alias definitions to encodings

=item L<Encode::Encoding> - Encode Implementation Base Class

=item L<Encode::Supported> - List of Supported Encodings

=item L<Encode::CN> - Simplified Chinese Encodings

=item L<Encode::JP> - Japanese Encodings

=item L<Encode::KR> - Korean Encodings

=item L<Encode::TW> - Traditional Chinese Encodings

=back

=head1 DESCRIPTION

The C<Encode> module provides the interface between Perl strings and the rest of the system. Perl strings are sequences of I<characters>.

The repertoire of characters that Perl can represent is a superset of those defined by the Unicode Consortium. On most platforms the ordinal values of a character as returned by C<ord(I<S>)> is the I<Unicode codepoint> for that character. The exceptions are platforms where the legacy encoding is some variant of EBCDIC rather than a superset of ASCII; see L<perlebcdic>.

During recent history, data is moved around a computer in 8-bit chunks, often called "bytes" but also known as "octets" in standards documents. Perl is widely used to manipulate data of many types: not only strings of characters representing human or computer languages, but also "binary"

data, being the machine's representation of numbers, pixels in an image, or just about anything.

When Perl is processing "binary data", the programmer wants Perl to process "sequences of bytes". This is not a problem for Perl: because a byte has 256 possible values, it easily fits in Perl's much larger "logical character".

This document mostly explains the [I<how>](#). [L<perlunitut>](#) and [L<perlunifaq>](#) explain the [I<why>](#).

## =head2 TERMINOLOGY

### =head3 character

A character in the range 0 .. 2\*\*32-1 (or more); what Perl's strings are made of.

### =head3 byte

A character in the range 0..255; a special case of a Perl character.

### =head3 octet

8 bits of data, with ordinal values 0..255; term for bytes passed to or from a non-Perl context, such as a disk file, standard I/O stream, database, command-line argument, environment variable, socket etc.

## =head1 THE PERL ENCODING API

### =head2 Basic methods

#### =head3 encode

```
$octets = encode(ENCODING, STRING[, CHECK])
```

Encodes the scalar value [I<STRING>](#) from Perl's internal form into [I<ENCODING>](#) and returns a sequence of octets. [I<ENCODING>](#) can be either a canonical name or an alias. For encoding names and aliases, see [L</"Defining Aliases">](#). For [CHECK](#), see [L</"Handling Malformed Data">](#).

For example, to convert a string from Perl's internal format into ISO-8859-1, also known as Latin1:

```
$octets = encode("iso-8859-1", $string);
```

**B<CAVEAT>**: When you run `C<$octets = encode("utf8", $string)>`, then `$octets` *might not be equal to* `$string`. Though both contain the same data, the UTF8 flag for `$octets` is *always* off. When you encode anything, the UTF8 flag on the result is always off, even when it contains a completely valid utf8 string. See [L</"The UTF8 flag">](#) below.

If the `$string` is `C<undef>`, then `C<undef>` is returned.

```
=head3 decode
```

```
$string = decode(ENCODING, OCTETS[, CHECK])
```

This function returns the string that results from decoding the scalar value `I<OCTETS>`, assumed to be a sequence of octets in `I<ENCODING>`, into Perl's internal form. The returns the resulting string. As with `encode()`, `I<ENCODING>` can be either a canonical name or an alias. For encoding names and aliases, see [L</"Defining Aliases">](#); for `I<CHECK>`, see [L</"Handling Malformed Data">](#).

For example, to convert ISO-8859-1 data into a string in Perl's internal format:

```
$string = decode("iso-8859-1", $octets);
```

**B<CAVEAT>**: When you run `C<$string = decode("utf8", $octets)>`, then `$string` *might not be equal to* `$octets`. Though both contain the same data, the UTF8 flag for `$string` is on unless `$octets` consists entirely of ASCII data on ASCII machines or EBCDIC on EBCDIC machines. See [L</"The UTF8 flag">](#) below.

If the `$string` is `C<undef>`, then `C<undef>` is returned.

```
=head3 find_encoding
```

```
[$obj =] find_encoding(ENCODING)
```

Returns the `I<encoding object>` corresponding to `I<ENCODING>`. Returns `C<undef>` if no matching `I<ENCODING>` is found. The returned object is what does the actual encoding or decoding.

```
$utf8 = decode($name, $bytes);
```

is in fact

```
$utf8 = do {
```

```

$obj = find_encoding($name);
croak qq(encoding "$name" not found) unless ref $obj;
$obj->decode($bytes);
};

```

with more error checking.

You can therefore save time  
by reusing this object as follows;

```

my $enc = find_encoding("iso-8859-1");
while(<>) {
    my $utf8 = $enc->decode($_);
    ... # now do something with $utf8;
}

```

Besides `L</decode>` and `L</encode>`, other methods are available as well. For instance, `C<name()>` returns the canonical name of the encoding object.

```
find_encoding("latin1")->name; # iso-8859-1
```

See `L<Encode::Encoding>` for details.

`=head3 from_to`

```
[$length =] from_to($octets, FROM_ENC, TO_ENC [, CHECK])
```

Converts `I<in-place>` data between two encodings. The data in `$octets` must be encoded as octets and `I<not>` as characters in Perl's internal format. For example, to convert ISO-8859-1 data into Microsoft's CP1250 encoding:

```
from_to($octets, "iso-8859-1", "cp1250");
```

and to convert it back:

```
from_to($octets, "cp1250", "iso-8859-1");
```

Because the conversion happens in place, the data to be converted cannot be a string constant: it must be a scalar variable.

`C<from_to()>` returns the length of the converted string in octets on success, and `C<undef>` on error.

**B<CAVEAT>**: The following operations may look the same, but are not:

```
from_to($data, "iso-8859-1", "utf8"); #1
$data = decode("iso-8859-1", $data); #2
```

Both #1 and #2 make \$data consist of a completely valid UTF-8 string, but only #2 turns the UTF8 flag on. #1 is equivalent to:

```
$data = encode("utf8", decode("iso-8859-1", $data));
```

See L</"The UTF8 flag"> below.

Also note that:

```
from_to($octets, $from, $to, $check);
```

is equivalent to:

```
$octets = encode($to, decode($from, $octets), $check);
```

Yes, it does I<not> respect the \$check during decoding. It is deliberately done that way. If you need minute control, use C<decode> followed by C<encode> as follows:

```
$octets = encode($to, decode($from, $octets, $check_from), $check_to);
```

```
=head3 encode_utf8
```

```
$octets = encode_utf8($string);
```

Equivalent to C<\$octets = encode("utf8", \$string)>. The characters in \$string are encoded in Perl's internal format, and the result is returned as a sequence of octets. Because all possible characters in Perl have a (loose, not strict) UTF-8 representation, this function cannot fail.

```
=head3 decode_utf8
```

```
$string = decode_utf8($octets [, CHECK]);
```

Equivalent to C<\$string = decode("utf8", \$octets [, CHECK])>. The sequence of octets represented by \$octets is decoded from UTF-8 into a sequence of logical characters. Because not all sequences of octets are valid UTF-8, it is quite possible for this function to fail. For CHECK, see L</"Handling Malformed Data">.

```
=head2 Listing available encodings
```

```
use Encode;
```

```
@list = Encode->encodings();
```

Returns a list of canonical names of available encodings that have already been loaded. To get a list of all available encodings including those that have not yet been loaded, say:

```
@all_encodings = Encode->encodings(":all");
```

Or you can give the name of a specific module:

```
@with_jp = Encode->encodings("Encode::JP");
```

When "C<::>" is not in the name, "C<Encode::>" is assumed.

```
@ebcdic = Encode->encodings("EBCDIC");
```

To find out in detail which encodings are supported by this package, see L<Encode::Supported>.

## =head2 Defining Aliases

To add a new alias to a given encoding, use:

```
use Encode;
use Encode::Alias;
define_alias(NEWNAME => ENCODING);
```

After that, I<NEWNAME> can be used as an alias for I<ENCODING>. I<ENCODING> may be either the name of an encoding or an I<encoding object>.

Before you do that, first make sure the alias is nonexistent using C<resolve\_alias()>, which returns the canonical name thereof. For example:

```
Encode::resolve_alias("latin1") eq "iso-8859-1" # true
Encode::resolve_alias("iso-8859-12") # false; nonexistent
Encode::resolve_alias($name) eq $name # true if $name is canonical
```

C<resolve\_alias()> does not need C<use Encode::Alias>; it can be imported via C<use Encode qw(resolve\_alias)>.

See L<Encode::Alias> for details.

## =head2 Finding IANA Character Set Registry names

The canonical name of a given encoding does

not necessarily agree with IANA Character Set Registry, commonly seen as C<< Content-Type: text/plain; charset=I<WHATEVER> >>. For most cases, the canonical name works, but sometimes it does not, most notably with "utf-8-strict".

As of C<Encode> version 2.21, a new method C<mime\_name()> is therefore added.

```
use Encode;
my $enc = find_encoding("UTF-8");
warn $enc->name;    # utf-8-strict
warn $enc->mime_name; # UTF-8
```

See also: L<Encode::Encoding>

=head1 Encoding via PerlIO

If your perl supports C<PerlIO> (which is the default), you can use a C<PerlIO> layer to decode and encode directly via a filehandle. The following two examples are fully identical in functionality:

```
### Version 1 via PerlIO
open(INPUT, "< :encoding(shiftjis)", $infile)
  || die "Can't open < $infile for reading: $!";
open(OUTPUT, "> :encoding(euc-jp)", $outfile)
  || die "Can't open > $output for writing: $!";
while (<INPUT>) { # auto decodes $_
  print OUTPUT;
# auto encodes $_
}
close(INPUT) || die "can't close $infile: $!";
close(OUTPUT) || die "can't close $outfile: $!";

### Version 2 via from_to()
open(INPUT, "< :raw", $infile)
  || die "Can't open < $infile for reading: $!";
open(OUTPUT, "> :raw", $outfile)
  || die "Can't open > $output for writing: $!";

while (<INPUT>) {
  from_to($_, "shiftjis", "euc-jp", 1); # switch encoding
  print OUTPUT; # emit raw (but properly encoded) data
}
close(INPUT) || die "can't close $infile: $!";
close(OUTPUT) || die "can't close $outfile: $!";
```

In the first version above, you let the appropriate encoding layer handle the conversion. In the second, you explicitly translate from one encoding to the other.

Unfortunately, it may be that encodings are C<PerlIO>-savvy. You can check to see whether your encoding is supported by C<PerlIO> by invoking the C<perlio\_ok> method on it:

```
Encode::perlio_ok("hz");      # false
find_encoding("euc-cn")->perlio_ok;
# true wherever PerlIO is available

use Encode qw(perlio_ok);     # imported upon request
perlio_ok("euc-jp")
```

Fortunately, all encodings that come with C<Encode> core are C<PerlIO>-savvy except for C<hz> and C<ISO-2022-kr>. For the gory details, see L<Encode::Encoding> and L<Encode::PerlIO>.

## =head1 Handling Malformed Data

The optional I<CHECK> argument tells C<Encode> what to do when encountering malformed data. Without I<CHECK>, C<Encode::FB\_DEFAULT> (== 0) is assumed.

As of version 2.12, C<Encode> supports coderef values for C<CHECK>; see below.

B<NOTE:> Not all encodings support this feature. Some encodings ignore the I<CHECK> argument. For example, L<Encode::Unicode> ignores I<CHECK> and it always croaks on error.

## =head2 List of I<CHECK> values

### =head3 FB\_DEFAULT

I<CHECK> = Encode::FB\_DEFAULT ( == 0)

If I<CHECK> is 0, encoding and decoding replace any malformed character with a I<substitution character>. When you encode, I<SUBCHAR> is used.

When you decode, the Unicode REPLACEMENT CHARACTER, code point U+FFFD, is used. If the data is supposed to be UTF-8, an optional lexical warning of warning category C<"utf8"> is given.

### =head3 FB\_CROAK

I<CHECK> = Encode::FB\_CROAK ( == 1)

If I<CHECK> is 1, methods immediately die with an error message. Therefore, when I<CHECK> is 1, you should trap

exceptions with `C<eval{}>`, unless you really want to let it `C<die>`.

```
=head3 FB_QUIET
```

```
I<CHECK> = Encode::FB_QUIET
```

If `I<CHECK>` is set to `C<Encode::FB_QUIET>`, encoding and decoding immediately return the portion of the data that has been processed so far when an error occurs. The data argument is overwritten with everything after that point; that is, the unprocessed portion of the data. This is handy when you have to call `C<decode>` repeatedly in the case where your source data may contain partial multi-byte character sequences, (that is, you are reading with a fixed-width buffer). Here's some sample code to do exactly that:

```
my($buffer, $string) = ("", "");
while (read($fh, $buffer, 256, length($buffer))) {
    $string .= decode($encoding, $buffer, Encode::FB_QUIET);
    # $buffer now contains the unprocessed partial character
}
```

```
=head3 FB_WARN
```

```
I<CHECK> = Encode::FB_WARN
```

This is the same as `C<FB_QUIET>` above, except that instead of being silent on errors, it issues a warning. This is handy for when you are debugging.

```
=head3 FB_PERLQQ FB_HTMLCREF FB_XMLCREF
```

```
=over 2
```

```
=item perlqq mode (I<CHECK> = Encode::FB_PERLQQ)
```

```
=item HTML charref mode (I<CHECK> = Encode::FB_HTMLCREF)
```

```
=item XML charref mode (I<CHECK> = Encode::FB_XMLCREF)
```

```
=back
```

For encodings that are implemented by the `C<Encode::XS>` module, `C<CHECK>` `C<===>` `C<Encode::FB_PERLQQ>` puts `C<encode>` and `C<decode>` into `C<perlqq>` fallback mode.

When you decode, `C<\xI<HH>>` is inserted for a malformed character, where `I<HH>` is the hex representation of the octet that could not be decoded to utf8. When you encode, `C<\x{I<HHHH>}>`

will be inserted, where I<HHHH> is the Unicode code point (in any number of hex digits) of the character that cannot be found in the character repertoire of the encoding.

The HTML/XML character reference modes are about the same. In place of C<\x{I<HHHH>}>, HTML uses C<&#I<NNN>;> where I<NNN> is a decimal number, and XML uses C<&#xI<HHHH>;> where I<HHHH> is the hexadecimal number.

In C<Encode> 2.10 or later, C<LEAVE\_SRC> is also implied.

=head3 The bitmask

These modes are all actually set via a bitmask. Here is how the C<FB\_I<XXX>> constants are laid out. You can import the C<FB\_I<XXX>> constants via C<use Encode qw(:fallbacks)>, and you can import the generic bitmask constants via C<use Encode qw(:fallback\_all)>.

|               | FB_DEFAULT | FB_CROAK | FB_QUIET | FB_WARN | FB_PERLQQ |
|---------------|------------|----------|----------|---------|-----------|
| DIE_ON_ERR    | 0x0001     | X        |          |         |           |
| WARN_ON_ERR   | 0x0002     |          |          | X       |           |
| RETURN_ON_ERR | 0x0004     |          | X        | X       |           |
| LEAVE_SRC     | 0x0008     |          |          |         |           |
|               | X          |          |          |         |           |
| PERLQQ        | 0x0100     |          |          | X       |           |
| HTMLCREF      | 0x0200     |          |          |         |           |
| XMLCREF       | 0x0400     |          |          |         |           |

=head3 LEAVE\_SRC

Encode::LEAVE\_SRC

If the C<Encode::LEAVE\_SRC> bit is I<not> set but I<CHECK> is set, then the source string to encode() or decode() will be overwritten in place.

If you're not interested in this, then bitwise-OR it with the bitmask.

=head2 coderef for CHECK

As of C<Encode> 2.12, C<CHECK> can also be a code reference which takes the ordinal value of the unmapped character as an argument and returns a string that represents the fallback character. For instance:

```
$ascii = encode("ascii", $utf8, sub{ sprintf "<U+%04X>", shift });
```

Acts like C<FB\_PERLQQ> but U+I<XXXX> is used instead of C<\x{I<XXXX>}>.

=head1 Defining Encodings

To define a new encoding, use:

```
use Encode qw(define_encoding);
define_encoding($object, CANONICAL_NAME [, alias...]);
```

I<CANONICAL\_NAME> will be associated with I<\$object>. The object should provide the interface described in L<Encode::Encoding>.

If more than two arguments are provided, additional arguments are considered aliases for I<\$object>.

See L<Encode::Encoding> for details.

## =head1 The UTF8 flag

Before the introduction of Unicode support in Perl, The C<eq> operator just compared the strings represented by two scalars. Beginning with Perl 5.8, C<eq> compares two strings with simultaneous consideration of I<the UTF8 flag>. To explain why we made it so, I quote from page 402 of I<Programming Perl, 3rd ed.>

=over 2

=item Goal #1:

Old byte-oriented programs should not spontaneously break on the old byte-oriented data they used to work on.

=item Goal #2:

Old byte-oriented programs should magically start working on the new character-oriented data when appropriate.

=item Goal #3:

Programs should run just as fast in the new character-oriented mode as in the old byte-oriented mode.

=item Goal #4:

Perl should remain one language, rather than forking into a byte-oriented Perl and a character-oriented Perl.

=back

When I<Programming Perl, 3rd ed.> was written, not even Perl 5.6.0 had been born yet, many features documented in the book remained unimplemented for a long time. Perl 5.8 corrected much of this, and the introduction of the

UTF8 flag is one of them. You can think of there being two fundamentally different kinds of strings and string-operations in Perl: one a byte-oriented mode for when the internal UTF8 flag is off, and the other a character-oriented mode for when the internal UTF8 flag is on.

Here is how C<Encode> handles the UTF8 flag.

=over 2

=item \*

When you I<encode>, the resulting UTF8 flag is always B<off>.

=item \*

When you I<decode>, the resulting UTF8 flag is B<on>--I<unless> you can unambiguously represent data. Here is what we mean by "unambiguously". After C<\$utf8 = decode("foo", \$octet)>,

When \$octet is... The UTF8 flag in \$utf8 is

-----  
In ASCII only (or EBCDIC only)           OFF

In ISO-8859-1                            ON

In any other Encoding                   ON  
-----

As you see, there is one exception: in ASCII. That way you can assume Goal #1. And with C<Encode>, Goal #2 is assumed but you still have to be careful in the cases mentioned in the B<CAVEAT> paragraphs above.

This UTF8 flag is not visible in Perl scripts, exactly for the same reason you cannot (or rather, you I<don't have to>) see whether a scalar contains a string, an integer, or a floating-point number. But you can still peek and poke these if you will. See the next section.

=back

=head2 Messing with Perl's Internals

The following API uses parts of Perl's internals in the current implementation. As such, they are efficient but may change in a future release.

=head3 is\_utf8

is\_utf8(STRING [, CHECK])

[INTERNAL] Tests whether the UTF8 flag is turned on in the I<STRING>. If I<CHECK> is true, also checks whether I<STRING> contains well-formed UTF-8.

Returns true if successful, false otherwise.

As of Perl 5.8.1, L<utf8> also has the C<utf8::is\_utf8> function.

=head3 \_utf8\_on

\_utf8\_on(STRING)

[INTERNAL] Turns the I<STRING>'s internal UTF8 flag B<on>. The I<STRING> is I<not> checked for containing only well-formed UTF-8. Do not use this unless you I<know with absolute certainty> that the STRING holds only well-formed UTF-8. Returns the previous state of the UTF8 flag (so please don't treat the return value as indicating success or failure), or C<undef> if I<STRING> is not a string.

B<NOTE>: For security reasons, this function does not work on tainted values.

=head3 \_utf8\_off

\_utf8\_off(STRING)

[INTERNAL] Turns the I<STRING>'s internal UTF8 flag B<off>. Do not use frivolously. Returns the previous state of the UTF8 flag, or C<undef> if I<STRING> is not a string. Do not treat the return value as indicative of success or failure, because that isn't what it means: it is only the previous setting.

B<NOTE>:

For security reasons, this function does not work on tainted values.

=head1 UTF-8 vs. utf8 vs. UTF8

....We now view strings not as sequences of bytes, but as sequences of numbers in the range 0 .. 2\*\*32-1 (or in the case of 64-bit computers, 0 .. 2\*\*64-1) -- Programming Perl, 3rd ed.

That has historically been Perl's notion of UTF-8, as that is how UTF-8 was first conceived by Ken Thompson when he invented it. However, thanks to later revisions to the applicable standards, official UTF-8 is now rather stricter than that. For example, its range is much narrower (0 .. 0x10\_FFFF to cover only 21 bits instead of 32 or 64 bits) and some sequences are not allowed, like those used in surrogate pairs, the 31 non-character code points 0xFDD0 .. 0xFDEF, the last two code points in I<any> plane (0xI<XX>\_FFFE and 0xI<XX>\_FFFF), all non-shortest encodings, etc.

The former default in which Perl would always use a loose interpretation of UTF-8 has now been overruled:

: but "UTF-8" is the name of the standard and should give the  
: corresponding behaviour.

For what it's worth, that's how I've always kept them straight in my head.

Also for what it's worth, Perl 6 will mostly default to strict but make it easy to switch back to lax.

Larry

Got that? As of Perl 5.8.7, B<"UTF-8"> means UTF-8 in its current sense, which is conservative and strict and security-conscious, whereas B<"utf8"> means UTF-8 in its former sense, which was liberal and loose and lax. C<Encode> version 2.10 or later thus groks this subtle but critically important distinction between C<"UTF-8"> and C<"utf8">.

```
encode("utf8", "\x{FFFF_FFFF}", 1); #  
okay  
encode("UTF-8", "\x{FFFF_FFFF}", 1); # croaks
```

In the C<Encode> module, C<"UTF-8"> is actually a canonical name for C<"utf-8-strict">. That hyphen between the C<"UTF"> and the C<"8"> is critical; without it, C<Encode> goes "liberal" and (perhaps overly-)permissive:

```
find_encoding("UTF-8")->name # is 'utf-8-strict'  
find_encoding("utf-8")->name # ditto. names are case insensitive  
find_encoding("utf_8")->name # ditto. "_" are treated as "-"  
find_encoding("UTF8")->name # is 'utf8'.
```

Perl's internal UTF8 flag is called "UTF8", without a hyphen. It indicates whether a string is internally encoded as "utf8", also without a hyphen.

NAME

constant - Perl pragma to declare constants

DESCRIPTION

This pragma allows you to declare constants at compile-time.

When a constant is used in an expression, Perl replaces it with its value at compile time, and may then optimize the expression further.

In particular, any code in an "if (CONSTANT)" block will be optimized away if the constant is false.

## INSTALLATION

To install this module, run the following commands:

```
perl Makefile.PL
make
make test
make install
```

Alternatively, to install with Module::Build, you can use the following commands:

```
perl Build.PL
./Build
./Build test
./Build install
```

## SUPPORT AND DOCUMENTATION

After installing, you can find documentation for this module with the perldoc command.

```
perldoc constant
```

You can also look for information at:

=head1 NAME

constant - Perl pragma to declare constants

=head1 SYNOPSIS

```
use constant PI => 4 * atan2(1, 1);
```

```
use constant DEBUG => 0;
```

```
print "Pi equals ", PI, "...\\n" if DEBUG;
```

```
use constant {
```

```
    SEC => 0,
```

```
    MIN => 1,
```

```
    HOUR => 2,
```

```
    MDAY => 3,
```

```
    MON => 4,
```

```
    YEAR => 5,
```

```
    WDAY => 6,
```

```
    YDAY => 7,
```

```
    ISDST => 8,
```

```
};
```

```
use constant WEEKDAYS => qw(
```

```
    Sunday Monday Tuesday Wednesday Thursday Friday Saturday
```

```
);
```

```
print "Today is ", (WEEKDAYS)[ (localtime)[WDAY] ], "\\n";
```

=head1 DESCRIPTION

This pragma allows you to declare constants at compile-time.

When you declare a constant such as C<PI> using the method shown above, each machine your script runs upon can have as many digits of accuracy as it can use. Also, your program will be easier to read, more likely to be maintained (and maintained correctly), and far less likely

to send a space probe to the wrong planet because nobody noticed the one equation in which you wrote C<3.14195>.

When a constant is used in an expression, Perl replaces it with its value at compile time, and may then optimize the expression further.

In particular, any code in an `C<if (CONSTANT)>` block will be optimized away if the constant is false.

## =head1 NOTES

As with all `C<use>` directives, defining a constant happens at compile time. Thus, it's probably not correct to put a constant declaration inside of a conditional statement (like `C<if ($foo) { use constant ... }>`).

Constants defined using this module cannot be interpolated into strings like variables. However, concatenation works just fine:

```
print "Pi equals PI...\n";    # WRONG: does not expand "PI"
print "Pi equals ".PI."...\n"; # right
```

Even though a reference may be declared as a constant, the reference may point to data which may be changed, as this code shows.

```
use constant ARRAY => [ 1,2,3,4 ];
print ARRAY->[1];
ARRAY->[1] = " be changed";
print ARRAY->[1];
```

Dereferencing constant references incorrectly (such as using an array subscript on a constant hash reference, or vice versa) will be trapped at compile time.

Constants belong to the package they are defined in. To refer to a constant defined in another package, specify the full package name, as in `C<Some::Package::CONSTANT>`. Constants may be exported by modules, and may also be called as either class or instance methods, that is, as `C<< Some::Package->CONSTANT >>` or as `C<< $obj->CONSTANT >>` where `C<$obj>` is an instance of `C<Some::Package>`. Subclasses may define their own constants to override those in their base class.

The use of all caps for constant names is merely a convention, although it is recommended in order to make constants stand out and to help avoid collisions with other barewords, keywords, and subroutine names. Constant names must begin with a letter or underscore. Names beginning with a double underscore are reserved. Some poor choices for names will generate warnings, if warnings are enabled at compile time.

## =head2 List constants

Constants may be lists of more (or less) than one value. A constant

with no values evaluates to C<undef> in scalar context. Note that constants with more than one value do I<not> return their last value in scalar context as one might expect. They currently return the number of values, but B<this may change in the future>. Do not use constants with multiple values in scalar context.

B<NOTE:> This implies that the expression defining the value of a constant is evaluated in list context. This may produce surprises:

```
use constant TIMESTAMP => localtime;      # WRONG!
use constant TIMESTAMP => scalar localtime; # right
```

The first line above defines C<TIMESTAMP> as a 9-element list, as returned by C<localtime()> in list context. To set it to the string returned by C<localtime()> in scalar context, an explicit C<scalar> keyword is required.

List constants are lists, not arrays. To index or slice them, they must be placed in parentheses.

```
my @workdays = WEEKDAYS[1 .. 5];      # WRONG!
my @workdays = (WEEKDAYS)[1 .. 5];    # right
```

=head2 Defining multiple constants at once

Instead of writing multiple C<use constant> statements, you may define multiple constants in a single statement by giving, instead of the constant name, a reference to a hash where the keys are the names of the constants to be defined. Obviously, all constants defined using this method must have a single value.

```
use constant {
    FOO => "A single value",
    BAR => "This", "won't", "work!",    # Error!
};
```

This is a fundamental limitation of the way hashes are constructed in Perl. The error messages produced when this happens will often be quite cryptic -- in the worst case there may be none at all, and you'll only later find that something is broken.

When defining multiple constants, you cannot use the values of other constants defined in the same declaration. This is because the calling package doesn't know about any constant within that group until I<after> the C<use> statement is finished.

```

use constant {
    BITMASK => 0xAFBAEBA8,
    NEGMASK => ~BITMASK,          # Error!
};

```

=head2 Magic constants

Magical values and references can be made into constants at compile time, allowing for way cool stuff like this. (These error numbers aren't totally portable, alas.)

```

use constant E2BIG => ($! = 7);
print E2BIG, "\n";    # something like "Arg list too long"
print 0+E2BIG, "\n"; # "7"

```

You can't produce a tied constant by giving a tied scalar as the value. References to tied variables, however, can be used as constants without any problems.

=head1 TECHNICAL NOTES

In the current implementation, scalar constants are actually inlinable subroutines. As of version 5.004 of Perl, the appropriate scalar constant is inserted directly in place of some subroutine calls, thereby saving the overhead of a subroutine call. See [L<perlsub/"Constant Functions">](#) for details about how and when this happens.

In the rare case in which you need to discover at run time whether a particular constant has been declared via this module, you may use this function to examine the hash `C<%constant::declared>`. If the given constant name does not include a package name, the current package is used.

```

sub declared ($) {
    use constant 1.01;    # don't omit this!
    my $name = shift;
    $name =~ s/^\s*/main::/;
    my $pkg = caller;
    my $full_name = $name =~ /::/ ? $name : "${pkg}::$name";
    $constant::declared{$full_name};
}

```

=head1 CAVEATS

In the current version of Perl, list constants are not inlined and some symbols may be redefined without generating a warning.

It is not possible to have a subroutine or a keyword with the same name as a constant in the same package. This is probably a Good Thing.

A constant with a name in the list C<STDIN STDOUT STDERR ARGV ARGVOUT ENV INC SIG> is not allowed anywhere but in package C<main::>, for technical reasons.

Unlike constants in some languages, these cannot be overridden on the command line or via environment variables.

You can get into trouble if you use constants in a context which automatically quotes barewords (as is true for any subroutine call). For example, you can't say C<\$hash{CONSTANT}> because C<CONSTANT> will be interpreted as a string. Use C<\$hash{CONSTANT()}> or C<\$hash{+CONSTANT}> to prevent the bareword quoting mechanism from kicking in. Similarly, since the C<< => >> operator quotes a bareword immediately to its left, you have to say C<< CONSTANT() => 'value' >> (or simply use a comma in place of the big arrow) instead of C<< CONSTANT => 'value' >>.

=head1 NAME

Encode::Locale - Determine the locale encoding

=head1 SYNOPSIS

```
use Encode::Locale;
use Encode;

$string = decode(locale => $bytes);
$bytes = encode(locale => $string);

if (-t) {
    binmode(STDIN, ":encoding(console_in)");
    binmode(STDOUT, ":encoding(console_out)");
    binmode(STDERR, ":encoding(console_out)");
}

# Processing file names passed in as arguments
my $uni_filename = decode(locale => $ARGV[0]);
open(my $fh, "<", encode(locale_fs => $uni_filename))
    || die "Can't open '$uni_filename': $!";
binmode($fh, ":encoding(locale)");
...
```

=head1 DESCRIPTION

In many applications it's wise to let Perl use Unicode for the strings it processes. Most of the interfaces Perl has to the outside world are still byte based. Programs therefore need to decode byte strings that enter the program from the outside and encode them again on the way out.

The POSIX locale system is used to specify both the language conventions requested by the user and the preferred character set to consume and output. The C<Encode::Locale> module looks up the charset and encoding (called a CODESET in the locale jargon) and arranges for the L<Encode> module to know this encoding under the name "locale". It means bytes obtained from the environment can be converted to Unicode strings by calling C<< Encode::encode(locale => \$bytes) >> and converted back again with C<< Encode::decode(locale => \$string) >>.

Where file systems interfaces pass file names in and out of the program we also need care. The trend is for operating systems to use a fixed file encoding that don't actually depend on the locale; and this module determines the most appropriate encoding for file names. The L<Encode> module will know this encoding under the name "locale\_fs". For traditional Unix systems this will be an alias to the same encoding as "locale".

For programs running in a terminal window (called a "Console" on some systems) the "locale" encoding is usually a good choice for what to expect as input and output. Some systems allow us to query the encoding set for the terminal and `C<Encode::Locale>` will do that if available and make these encodings known under the `C<Encode>` aliases "console\_in" and "console\_out". For systems where we can't determine the terminal encoding these will be aliased as the same encoding as "locale". The advice is to use "console\_in" for input known to come from the terminal and "console\_out" for output known to go from the terminal.

In addition to arranging for various Encode aliases the following functions and variables are provided:

=over

=item `decode_argv()`

=item `decode_argv( Encode::FB_CROAK )`

This will decode the command line arguments to perl (the `C<@ARGV>` array) in-place.

The function will by default replace characters that can't be decoded by `"\x{FFFD}"`, the Unicode replacement character.

Any argument provided is passed as `CHECK` to underlying `Encode::decode()` call.

Pass the value `C<Encode::FB_CROAK>` to have the decoding croak if not all the command line arguments can be decoded. See [L<Encode/"Handling Malformed Data">](#) for details on other options for `CHECK`.

=item `env( $uni_key )`

=item `env( $uni_key => $uni_value )`

Interface to get/set environment variables. Returns the current value as a Unicode string. The `$uni_key` and `$uni_value` arguments are expected to be Unicode strings as well. Passing `C<undef>` as `$uni_value` deletes the environment variable named `$uni_key`.

The returned value will have the characters that can't be decoded replaced by `"\x{FFFD}"`, the Unicode replacement character.

There is no interface to request alternative `CHECK` behavior as for `decode_argv()`. If you need that you need to call `encode/decode` yourself. For example:

```
my $key = Encode::encode(locale => $uni_key, Encode::FB_CROAK);
my $uni_value = Encode::decode(locale => $ENV{$key}, Encode::FB_CROAK);
```

```
=item reinit()
```

```
=item reinit(
  $encoding )
```

Reinitialize the encodings from the locale. You want to call this function if you changed anything in the environment that might influence the locale.

This function will croak if the determined encoding isn't recognized by the Encode module.

With argument force \$ENCODING\_... variables to set to the given value.

```
=item $ENCODING_LOCALE
```

The encoding name determined to be suitable for the current locale.

L<Encode> know this encoding as "locale".

```
=item $ENCODING_LOCALE_FS
```

The encoding name determined to be suitable for file system interfaces involving file names.

L<Encode> know this encoding as "locale\_fs".

```
=item $ENCODING_CONSOLE_IN
```

```
=item $ENCODING_CONSOLE_OUT
```

The encodings to be used for reading and writing output to the a console.

L<Encode> know these encodings as "console\_in" and "console\_out".

```
=back
```

```
=head1 NOTES
```

This table summarizes the mapping of the encodings set up by the C<Encode::Locale> module:

| Encode                  |          |             |             |
|-------------------------|----------|-------------|-------------|
| Alias                   |          |             |             |
| Windows                 | Mac OS X | POSIX       |             |
| -----+-----+-----+----- |          |             |             |
| locale                  | ANSI     | nl_langinfo | nl_langinfo |
| locale_fs               | ANSI     | UTF-8       | nl_langinfo |
| console_in              | OEM      | nl_langinfo | nl_langinfo |

console\_out | OEM | nl\_langinfo | nl\_langinfo

=head2 Windows

Windows has basically 2 sets of APIs. A wide API (based on passing UTF-16 strings) and a byte based API based a character set called ANSI. The regular Perl interfaces to the OS currently only uses the ANSI APIs. Unfortunately ANSI is not a single character set.

The encoding that corresponds to ANSI varies between different editions of Windows. For many western editions of Windows ANSI corresponds to CP-1252 which is a character set similar to ISO-8859-1. Conceptually the ANSI character set is a similar concept to the POSIX locale CODESET so this module figures out what the ANSI code page is and make this available as \$ENCODING\_LOCALE and the "locale" Encoding alias.

Windows

systems also operate with another byte based character set. It's called the OEM code page. This is the encoding that the Console takes as input and output. It's common for the OEM code page to differ from the ANSI code page.

=head2 Mac OS X

On Mac OS X the file system encoding is always UTF-8 while the locale can otherwise be set up as normal for POSIX systems.

File names on Mac OS X will at the OS-level be converted to NFD-form. A file created by passing a NFC-filename will come in NFD-form from readdir(). See [L<Unicode::Normalize>](#) for details of NFD/NFC.

Actually, Apple does not follow the Unicode NFD standard since not all character ranges are decomposed. The claim is that this avoids problems with round trip conversions from old Mac text encodings. See [L<Encode::UTF8Mac>](#) for details.

=head2 POSIX (Linux and other Unixes)

File systems might vary in what encoding is to be used for filenames. Since this module has no way to actually figure out what the is correct it goes with the best guess which is to assume filenames are encoding according to the current locale. Users are advised to always specify UTF-8 as the locale charset.

=back

=head1 NOTES

Test::More is B<explicitly> tested all the way back to perl 5.004.

Test::More is thread-safe for perl 5.8.0 and up.

=head1 BUGS and CAVEATS

=over 4

=item Making your own ok()

If you are trying to extend Test::More, don't. Use Test::Builder instead.

=item The eq\_\* family has some caveats.

=item Test::Harness upgrades

no\_plan and todo depend on new Test::Harness features and fixes. If you're going to distribute tests that use no\_plan or todo your end-users will have to upgrade Test::Harness to the latest one on CPAN. If you avoid no\_plan and TODO tests, the stock Test::Harness will work fine.

If you simply depend on Test::More, it's own dependencies will cause a Test::Harness upgrade.

=back

=head1 HISTORY

This is a case of convergent evolution with Joshua Pritikin's Test module. I was largely unaware of its existence when I'd first written my own ok() routines. This module exists because I can't figure out how to easily wedge test names into Test's interface (along with a few other problems).

The goal here is to have a testing utility that's simple to learn, quick to use and difficult to trip yourself up with while still providing more flexibility than the existing Test.pm. As such, the names of the most common routines are kept tiny, special cases and magic side-effects are kept to a minimum. WYSIWYG.

=head1 SEE ALSO

L<Test::Simple> if all this confuses you and you just want to write

some tests. You can upgrade to Test::More later (it's forward compatible).

L<Test::Differences> for more ways to test complex data structures. And it plays well with Test::More.

L<Test> is the old testing module. Its main benefit is that it has been distributed with Perl since 5.004\_05.

L<Test::Harness> for details on how your test results are interpreted by Perl.

L<Test::Unit> describes a very featureful unit testing interface.

L<Test::Inline> shows the idea of embedded testing.

L<SelfTest> is another approach to embedded testing.

=head1 AUTHORS

=cut

Found in path(s):

\* /opt/cola/permits/1592955594\_1678786368.6658235/0/perl-Storable-2.45-3.el7-1.src.rpm-cosi-expand-archive-p75jAUEh/Storable-2.45.tar.gz-cosi-expand-archive-EAI2rTY3/Storable-2.45/t/compat/Test/More.pm

No license file was found, but licenses were detected in source scan.

=back

Test::Simple will start by printing number of tests run in the form "1..M" (so "1..5" means you're going to run 5 tests). This strange format lets Test::Harness know how many tests you plan on running in

case something goes horribly wrong.

If all your tests passed, Test::Simple will exit with zero (which is normal). If anything failed it will exit with how many failed. If you run less (or more) tests than you planned, the missing (or extras) will be considered failures. If no tests were ever run Test::Simple will throw a warning and exit with 255. If the test died, even after having successfully completed all its tests, it will still be considered a failure and will exit with 255.

So the exit codes are...

|                  |   |
|------------------|---|
| 0                | all tests successful                          |
| 255              | test died                                     |
| any other number | how many failed (including missing or extras) |

If you fail more than 254 tests, it will be reported as 254.

This module is by no means trying to be a complete testing system. It's just to get you started. Once you're off the ground its recommended you look at L<Test::More>.

=head1 EXAMPLE

Here's an example of a simple .t file for the fictional Film module.

```
use Test::Simple tests => 5;

use Film; # What you're testing.

my $btaste = Film->new({ Title => 'Bad Taste',
                      Director => 'Peter Jackson',
                      Rating => 'R',
                      NumExplodingSheep => 1
                      });
ok( defined($btaste) and ref $btaste eq 'Film', 'new() works' );

ok( $btaste->Title eq 'Bad Taste', 'Title() get' );
ok( $btaste->Director eq 'Peter Jackson', 'Director() get' );
ok( $btaste->Rating eq 'R', 'Rating() get' );
ok( $btaste->NumExplodingSheep == 1, 'NumExplodingSheep() get' );
```

It will produce output like this:

```
1..5
ok 1 - new() works
```

```
ok 2 - Title() get
ok 3 - Director() get
not ok 4 - Rating() get
# Failed test (t/film.t at line 14)
ok 5 - NumExplodingSheep() get
# Looks like you failed 1 tests of 5
```

Indicating the Film::Rating() method is broken.

=head1 CAVEATS

Test::Simple will only report a maximum of 254 failures in its exit code. If this is a problem, you probably have a huge test script. Split it into multiple files. (Otherwise blame the Unix folks for using an unsigned short integer as the exit status).

Because VMS's exit codes are much, much different than the rest of the universe, and perl does horrible mangling to them that gets in my way, it works like this on VMS.

```
0  $$$_NORMAL    all tests successful
4  $$$_ABORT     something went wrong
```

Unfortunately, I can't differentiate any further.

=head1 NOTES

Test::Simple is B<explicitly> tested all the way back to perl 5.004.

Test::Simple is thread-safe in perl 5.8.0 and up.

=head1 HISTORY

This module was conceived while talking with Tony Bowden in his kitchen one night about the problems I was having writing some really complicated feature into the new Testing module. He observed that the main problem is not dealing with these edge cases but that people hate to write tests B<at all>. What was needed was a dead simple module that took all the hard work out of testing and was really, really easy to learn. Paul Johnson simultaneously had this idea (unfortunately, he wasn't in Tony's kitchen). This is it.

=head1 SEE ALSO

=over 4

=item L<Test::More>

More testing functions! Once you outgrow Test::Simple, look at Test::More. Test::Simple is 100% forward compatible with Test::More (i.e. you can just use Test::More instead of Test::Simple in your programs and things will still work).

=item L<Test>

The original Perl testing module.

=item L<Test::Unit>

Elaborate unit testing.

=item L<Test::Inline>, L<SelfTest>

Embed tests in your code!

=item L<Test::Harness>

Interprets  
the output of your test program.

+=====

| Storable is distributed as a module, but is also part of the official  
| Perl core distribution, as of perl 5.8.  
| Maintenance is now done by the perl5-porters. We thank Raphael  
| Manfredi for providing us with this very  
| useful module.

+=====

The Storable extension brings persistence to your data.

You may recursively store to disk any data structure, no matter how complex and circular it is, provided it contains only SCALAR, ARRAY, HASH (possibly tied) and references (possibly blessed) to those items.

At a later stage, or in another program, you may retrieve data from the stored file and recreate the same hierarchy in memory. If you had blessed references, the retrieved references are blessed into the same package, so you must make sure you have access to the same perl class than the one used to create the relevant objects.

There is also a dclone() routine which performs an optimized mirroring of any data structure, preserving its topology.

Objects (blessed references) may also redefine the way storage and retrieval is performed, and/or what deep cloning should do on those objects.

To compile this extension, run:

```
perl Makefile.PL  
[PERL_SRC=...where you put perl sources...]  
make  
make install
```

There is an embedded POD manual page in Storable.pm.

Storable was written by Raphael Manfredi <Raphael\_Manfredi@pobox.com>  
Maintenance is now done by the perl5-porters <perl5-porters@perl.org>

Please e-mail us with problems, bug fixes, comments and complaints, although if you have complements you should send them to Raphael. Please don't e-mail Raphael with problems, as he no longer works on Storable, and your message will be delayed while he forwards it to us.

=head1 NAME

ppport.h - Perl/Pollution/Portability version 3.20

=head1 SYNOPSIS

perl ppport.h [options] [source files]

Searches current directory for files if no [source files] are given

--help            show short help

--version        show version

--patch=file     write one patch file with changes

--copy=suffix    write changed copies with suffix

--diff=program   use diff program and options

--compat-version=version

    provide compatibility with Perl version

--cplusplus     accept C++ comments

--quiet          don't output anything except fatal errors

--nodiag        don't show diagnostics

--nohints       don't show hints

--nochanges     don't suggest changes

--nofilter      don't filter input files

--strip           strip all script and doc functionality from  
                  ppport.h

--list-provided    list provided API

--list-unsupported list unsupported API

--api-info=name    show Perl API portability information

## =head1 COMPATIBILITY

This version of F<ppport.h> is designed to support operation with Perl installations back to 5.003, and has been tested up to 5.11.5.

## =head1 OPTIONS

=head2 --help

Display a brief usage summary.

=head2 --version

Display the version of F<ppport.h>.

=head2 --patch=I<file>

If this option is given,  
a single patch file will be created if  
any changes are suggested. This requires a working diff program  
to be installed on your system.

=head2 --copy=I<suffix>

If this option is given, a copy of each file will be saved with  
the given suffix that contains the suggested changes. This does  
not require any external programs. Note that this does not  
automagially add a dot between the original filename and the  
suffix. If you want the dot, you have to include it in the option  
argument.

If neither C<--patch> or C<--copy> are given, the default is to  
simply print the diffs for each file. This requires either  
C<Text::Diff> or a C<diff> program to be installed.

=head2 --diff=I<program>

Manually set the diff program and options to use. The default  
is to use C<Text::Diff>, when installed, and output unified  
context diffs.

=head2 --compat-version=I<version>

Tell F<ppport.h> to check for compatibility with the given Perl version. The default is to check for compatibility with Perl version 5.003.

You can use this option to reduce the output of F<ppport.h> if you intend to be backward compatible only down to a certain Perl version.

=head2 --cplusplus

Usually, F<ppport.h> will detect C++ style comments and replace them with C style comments for portability reasons. Using this option instructs F<ppport.h> to leave C++ comments untouched.

=head2 --quiet

Be quiet. Don't print anything except fatal errors.

=head2 --nodiag

Don't output any diagnostic messages. Only portability alerts will be printed.

=head2 --nohints

Don't output any hints. Hints often contain useful portability notes. Warnings will still be displayed.

=head2 --nochanges

Don't suggest any changes. Only give diagnostic output and hints unless these are also deactivated.

=head2 --nofilter

Don't filter the list of input files. By default, files not looking like source code (i.e. not \*.xs, \*.c, \*.cc, \*.cpp or \*.h) are skipped.

=head2 --strip

Strip all script and documentation functionality from F<ppport.h>. This reduces the size of F<ppport.h> dramatically and may be useful if you want to include F<ppport.h> in smaller modules without increasing their distribution size too much.

The stripped F<ppport.h> will have a C<--unstrip> option that allows you to undo the stripping, but only if an appropriate C<Devel::PPPort> module is installed.

=head2 --list-provided

Lists the API elements for which compatibility is provided by F<ppport.h>. Also lists if it must be explicitly requested, if it has dependencies, and if there are hints or warnings for it.

=head2 --list-unsupported

Lists the API elements that are known not to be supported by F<ppport.h> and below which version of Perl they probably won't be available or work.

=head2 --api-info=I<name>

Show portability information for API elements matching I<name>. If I<name> is surrounded by slashes, it is interpreted as a regular expression.

=head1 DESCRIPTION

In order for a Perl extension (XS) module to be as portable as possible across differing versions of Perl itself, certain steps need to be taken.

=over 4

=item \*

Including this header is the first major one. This alone will give you access to a large part of the Perl API that hasn't been available in earlier Perl releases. Use

```
perl ppport.h --list-provided
```

to see which API elements are provided by ppport.h.

=item \*

You should avoid using deprecated parts of the API. For example, using global Perl variables without the C<PL\_> prefix is deprecated. Also, some API functions used to have a C<perl\_> prefix. Using this form is also deprecated. You can safely use the supported API, as F<ppport.h> will provide wrappers for older Perl versions.

=item \*

If you use one of a few functions or variables that were not present in earlier versions of Perl, and that can't be provided using a macro, you have to explicitly request support for these functions by adding one or more C<#define>s in your source code before the inclusion of F<ppport.h>.

These functions or variables will be marked C<explicit> in the list shown by C<--list-provided>.

Depending on whether your module has a single or multiple files that use such functions or variables, you want either C<static> or global variants.

For a C<static> function or variable (used only in a single source file), use:

```
#define NEED_function
#define NEED_variable
```

For a global function or variable (used in multiple source files), use:

```
#define NEED_function_GLOBAL
#define NEED_variable_GLOBAL
```

Note that you mustn't have more than one global request for the same function or variable in your project.

| Function / Variable  | Static Request          | Global Request                 |
|----------------------|-------------------------|--------------------------------|
| PL_parser            | NEED_PL_parser          | NEED_PL_parser_GLOBAL          |
| PL_signals           | NEED_PL_signals         | NEED_PL_signals_GLOBAL         |
| eval_pv()            | NEED_eval_pv            | NEED_eval_pv_GLOBAL            |
| grok_bin()           | NEED_grok_bin           | NEED_grok_bin_GLOBAL           |
| grok_hex()           | NEED_grok_hex           | NEED_grok_hex_GLOBAL           |
| grok_number()        | NEED_grok_number        | NEED_grok_number_GLOBAL        |
| grok_numeric_radix() | NEED_grok_numeric_radix | NEED_grok_numeric_radix_GLOBAL |
| grok_oct()           | NEED_grok_oct           | NEED_grok_oct_GLOBAL           |

| <code>pv_pretty()</code>              | <code>NEED_pv_pretty</code>              | <code>NEED_pv_pretty_GLOBAL</code>              |
| <code>sv_2pv_flags()</code>           | <code>NEED_sv_2pv_flags</code>           | <code>NEED_sv_2pv_flags_GLOBAL</code>           |
| <code>sv_2pvbyte()</code>             | <code>NEED_sv_2pvbyte</code>             | <code>NEED_sv_2pvbyte_GLOBAL</code>             |
| <code>sv_catpvf_mg()</code>           | <code>NEED_sv_catpvf_mg</code>           | <code>NEED_sv_catpvf_mg_GLOBAL</code>           |
| <code>sv_catpvf_mg_nocontext()</code> | <code>NEED_sv_catpvf_mg_nocontext</code> | <code>NEED_sv_catpvf_mg_nocontext_GLOBAL</code> |
| <code>sv_pvn_force_flags()</code>     | <code>NEED_sv_pvn_force_flags</code>     | <code>NEED_sv_pvn_force_flags_GLOBAL</code>     |
| <code>sv_setpvf_mg()</code>           | <code>NEED_sv_setpvf_mg</code>           |   |
|                                       | <code>NEED_sv_setpvf_mg_GLOBAL</code>    |   |
| <code>sv_setpvf_mg_nocontext()</code> | <code>NEED_sv_setpvf_mg_nocontext</code> | <code>NEED_sv_setpvf_mg_nocontext_GLOBAL</code> |
| <code>vload_module()</code>           | <code>NEED_vload_module</code>           | <code>NEED_vload_module_GLOBAL</code>           |
| <code>vnewSVpvf()</code>              | <code>NEED_vnewSVpvf</code>              | <code>NEED_vnewSVpvf_GLOBAL</code>              |
| <code>warner()</code>                 | <code>NEED_warner</code>                 | <code>NEED_warner_GLOBAL</code>                 |

To avoid namespace conflicts, you can change the namespace of the explicitly exported functions / variables using the `C<DPPP_NAMESPACE>` macro. Just `C<#define>` the macro before including `C<ppport.h>`:

```
#define DPPP_NAMESPACE MyOwnNamespace_
#include "ppport.h"
```

The default namespace is `C<DPPP_>`.

=back

The good thing is that most of the above can be checked by running `F<ppport.h>` on your source code. See the next section for details.

=head1 EXAMPLES

To verify whether `F<ppport.h>` is needed for your module, whether you should make any changes to your code, and whether any special defines should be used, `F<ppport.h>` can be run as a Perl script to check your source code. Simply say:

```
perl ppport.h
```

The result will usually be a list of patches suggesting changes that should at least be acceptable, if not necessarily the most efficient solution, or a fix for all possible problems.

If you know that your XS module uses features only available in

newer Perl releases, if you're aware that it uses C++ comments, and if you want all suggestions as a single patch file, you could use something like this:

```
perl ppport.h --compat-version=5.6.0 --cplusplus --patch=test.diff
```

If you only want your code to be scanned without any suggestions for changes, use:

```
perl ppport.h --nochanges
```

You can specify a different C<diff> program or options, using the C<--diff> option:

```
perl ppport.h --diff='diff -C 10'
```

This would output context diffs with 10 lines of context.

If you want to create patched copies of your files instead, use:

```
perl ppport.h --copy=.new
```

To display portability information for the C<newSVpv> function, use:

```
perl ppport.h --api-info=newSVpv
```

Since the argument to C<--api-info> can be a regular expression, you can use

```
perl ppport.h --api-info=/_nomg$/
```

to display portability information for all C<\_nomg> functions or

```
perl ppport.h --api-info=./.
```

to display information for all known API elements.

## =head1 BUGS

If this version of F<ppport.h> is causing failure during the compilation of this module, please check if newer versions of either this module or C<Devel::PPPort> are available on CPAN before sending a bug report.

If F<ppport.h> was generated using the latest version of C<Devel::PPPort> and is causing failure of this module, please

file a bug report using the CPAN Request Tracker at [L<http://rt.cpan.org/>](http://rt.cpan.org/).

Please include the following information:

=over 4

=item 1.

The complete output from running "perl -V"

=item 2.

This file.

=item 3.

The name and version of the module you were trying to build.

=item 4.

A full log of the build that failed.

=item

5.

Any other information that you think could be relevant.

=back

For the latest version of this code, please get the `C<Devel::PPPort>` module from CPAN.

=head1 NAME

Data::Dumper - stringified perl data structures, suitable for both printing and C<eval>

=head1 SYNOPSIS

use Data::Dumper;

# simple procedural interface

print Dumper(\$foo, \$bar);

```

# extended usage with names
print Data::Dumper->Dump([$foo, $bar], [qw(foo *ary)]);

# configuration variables
{
    local $Data::Dumper::Purity = 1;
    eval Data::Dumper->Dump([$foo, $bar], [qw(foo *ary)]);
}

# OO usage
$d = Data::Dumper->new([$foo, $bar], [qw(foo *ary)]);
...
print $d->Dump;
...
$d->Purity(1)->Terse(1)->Deepcopy(1);
eval $d->Dump;

```

=head1 DESCRIPTION

Given a list of scalars or reference variables, writes out their contents in perl syntax. The references can also be objects. The content of each variable is output in a single Perl statement. Handles self-referential structures correctly.

The return value can be C<eval>ed to get back an identical copy of the original reference structure. (Please do consider the security implications of eval'ing code from untrusted sources!)

Any references that are the same as one of those passed in will be named C<\$VAR>I<n> (where I<n> is a numeric suffix), and other duplicate references to substructures within C<\$VAR>I<n> will be appropriately labeled using arrow notation. You can specify names for individual values to be dumped if you use the C<Dump()> method, or you can change the default C<\$VAR> prefix to something else. See C<\$Data::Dumper::Vname> and C<\$Data::Dumper::Terse> below.

The default output of self-referential structures can be C<eval>ed, but the nested references to C<\$VAR>I<n> will be undefined, since a recursive structure cannot be constructed using one Perl statement. You should set the C<Purity> flag to 1 to get additional statements that will correctly fill in these references. Moreover, if C<eval>ed when strictures are in effect, you need to ensure that any variables it accesses are previously declared.

In the extended usage form, the references to be dumped can be given user-specified names. If a name begins with a C<\*>, the output will

describe the dereferenced type of the supplied reference for hashes and arrays, and coderefs. Output of names will be avoided where possible if the C<Terse> flag is set.

In many cases, methods that are used to set the internal state of the object will return the object itself, so method calls can be conveniently chained together.
