

## Cisco Virtual Topology System (VTS) 2.6.2 Developer Guide

Updated: August 24, 2018

**Cisco Systems, Inc.**

[www.cisco.com](http://www.cisco.com)

Cisco has more than 200 offices worldwide.  
Addresses, phone numbers, and fax numbers  
are listed on the Cisco website at  
[www.cisco.com/go/offices](http://www.cisco.com/go/offices).

### **Abstract**

The Cisco Virtual Topology System (VTS) 2.6.2 Developer Guide gives information on VTS APIs and development features.

The Virtual Topology System (VTS) provides L2 and L3 connectivity to tenant, router, and service VMs. The main components of the VTS are the Virtual Topology Controller (VTC) and the VTSR.

<b>4.19</b>	<b>L3 Service Extension Template API .....</b>	<b>49</b>
4.19.1	Create a L3 service extension template .....	49
4.19.2	Updating a L3 service extension template.....	50
4.19.3	Get List of Templates .....	51
4.19.4	Get a specific template using name .....	52
4.19.5	Delete all templates.....	53
4.19.6	Delete a template identified by name .....	53
4.19.7	Create a template device group .....	53
4.19.8	Get a list of all template device groups.....	54
4.19.9	Get a specific template device group .....	55
4.19.10	Delete a specific template device group .....	55
4.19.11	Attach L3 service extension template to a router .....	56
4.19.12	Get a list of all the existing L3 service extension template associations .....	57
4.19.13	Detach L3 service extension template from tenant or router .....	58
4.19.14	Dry Run L3 Template .....	58
<b>4.20</b>	<b>DRY RUN Device Template attach.....</b>	<b>62</b>
4.20.1	Attach API.....	62
4.20.2	Detach API .....	62
<b>4.21</b>	<b>Route Template API .....</b>	<b>63</b>
4.21.1	Create Route Template .....	63
4.21.2	Updating a Template .....	66
4.21.3	Get List of Templates .....	66
4.21.4	Get a template using name .....	67
4.21.5	Delete all templates.....	68

4.21.6	Delete a template identified by name .....	68
4.21.7	Get a list of all existing route template associations .....	68
4.21.8	Attach Route Template to Router .....	68
4.21.9	Get Template Type .....	68
4.21.10	Get List of Import Route Targets.....	69
4.21.11	Get List of Export Route Targets .....	69
4.21.12	Set Import Route Target to Route Template.....	69
4.21.13	Set Export Route Target to Route Template .....	70
4.21.14	Set Route Target to Internal Device.....	70
4.21.15	Set Route Target to External Device .....	70
4.21.16	Set Route Target to Both Internal and External Device .....	71
4.21.17	Get List of Static Routes in Route Template .....	71
4.21.18	Set a static route to a route template .....	71
4.21.19	Delete a specific static route from Route Template.....	72
4.21.20	Delete a specific import route target from route template .....	72
4.21.21	Delete a specific export route target from route template .....	72
<b>4.22</b>	<b>Resource Pools .....</b>	<b>73</b>
4.22.1	Vni Pool Creation (for the site with VxLAN Data Plane only) .....	73
4.22.2	Evi Pool Creation (for the site with MPLS Data Plane only) .....	73
4.22.3	Vlan Pool Creation .....	74
4.22.4	Interface Dot1Q Pool Creation .....	75
4.22.5	Multicast Pool Creation .....	75
4.22.6	Create a Restricted Range in VNI Pool (for the site with VxLAN Data Plane).....	75
4.22.7	Create a Restricted Range in EVI Pool (for the site with MPLS Data Plane) .....	76
4.22.8	Unrestricting a Range (for the site with VxLAN Data Plane).....	76
4.22.9	Unrestricting a Range (for the site with MPLS Data Plane) .....	77
4.22.10	Restricting static allocations to range only .....	77
<b>4.23</b>	<b>Profiles.....</b>	<b>78</b>
4.23.1	Stitching profile .....	78
4.23.2	BGP profile .....	79
4.23.3	Route policy profile .....	80
4.23.4	Get any profile .....	81
4.23.5	Delete any profile.....	81
<b>4.24</b>	<b>Global Route Table (GRT) service profile ( Route Leak profile) .....</b>	<b>81</b>
4.24.1	Create/Update a GRT Profile URI .....	81
4.24.2	Sample payload .....	82
4.24.3	GET VPN for Overlay Route Policy Profile .....	83
4.24.4	Associate VPN ID to Router .....	83
<b>4.25</b>	<b>AAA.....</b>	<b>84</b>
4.25.1	Authentication and Authorization.....	84
4.25.2	Accounting / Logging to Tacacs+ Server .....	87
<b>4.26</b>	<b>Device Objects.....</b>	<b>89</b>
4.26.1	Create Ethernet object .....	89
4.26.2	Create port-channel device object.....	91
4.26.3	Update of existing device object with keypath/value modification.....	91
4.26.4	Delete of device object with no association to devices .....	92
4.26.5	Getting a particular device object .....	93
4.26.6	Get List of device-objects .....	94
4.26.7	Get a particular device-object's definition params .....	94
4.26.8	Associating device-object to a device by creating an instance .....	95
4.26.9	Updating a particular device-object association instance on device .....	95
4.26.10	Updating of multiple instances of device object associated with device.....	96
4.26.11	Get of device-object device association instance(s) .....	98

4.26.12	Get of <do-edit-applied> flag of a device to check if device-object edit got applied or not	99
4.26.13	DELETE of a particular device object instance associated with a device.....	101
4.26.14	DELETE all instances of device object instances.....	102
4.26.15	DELETE of a particular device object instance associated with a device.....	102
4.26.16	DELETE all instances of device object instances.....	102
4.26.17	IMPORTANT NOTES AND CAVEATS RELATED TO DEVICE OBJECTS.....	102
<b>4.27</b>	<b>Full Text Search of Device Objects.....</b>	<b>105</b>
4.27.1	Get search results.....	105
<b>4.28</b>	<b>L2 Template dry run API.....</b>	<b>115</b>
4.28.1	Attach template while adding a network .....	115
4.28.2	Attach template while editing a network.....	118
4.28.3	Detach L2 Template .....	120
<b>4.29</b>	<b>Static Routes:.....</b>	<b>123</b>
4.29.1	Get Static Routes: .....	123
4.29.2	Create Static Route .....	123
4.29.3	Update Static Route.....	127
4.29.4	Delete Static Route .....	128
<b>4.30</b>	<b>BGP Port extension: .....</b>	<b>129</b>

## 2 Overview of VTS API

The VTS API is exposed north-bound by the VTC component. The API is used to:

- Provision VTC with the Inventory of the DC topology
- Provision VTC with the Hardware VTEP Info
- Provision VTC with the information about the networks that will be serviced by the associated tenants
- Provision VTC with the information about sub-networks
- Provision VTC with the information about VMs attached to the networks
- Provision VTC with the information of L3 router and its interfaces that will be used for L3 connectivity between the tenant VMs

### 2.1 Architecture

#### VTS 1.5: EVPN based VxLAN Usecase

#### 2.1.1 Virtual Topology Controller (VTC)

VTC is the topology controller for the VTS; VTC controls all the hardware VTEPs to provide intra DC connectivity between VMs belonging to the same tenant zone in the DC and inter DC/WAN connectivity to remote networks belonging to the same tenant. VTC learns about remote networks by peering using BGP and other routing protocols to remote peers and route reflectors.

The VTC VM will have one VNIC interface which has VIP address:

- One for control, used in the NB API to program VTC.

### 2.2 Key Concepts

The VTC northbound API is a REST API over HTTPS. A VM managing entity is assumed to create VMs and call the VTC APIs to provide the required information for the creation of the virtual networks.

For security reasons the API implements certificate-based validation both on client side (the Managing Entity) and server side (VTC). The user is responsible for creating and uploading the server-side certificate in VTC, as well as creating and using the certificate on the client side. Instructions for the upload of certificate are specified in section 4.4.

## 3 Preparing to Use the VTS API

The VTC NB API is used to provision the VTC with all hardware VTEPS that it controls, as well the networks, subnets and VMs that will be deployed on the compute servers.

### 3.1 Requirements

In order to exercise the API you should be able to issue https requests to VTC. This can be done by a binary or script. This document provides client-side examples using the curl command.

### 3.2 Installing the VTS API

The VTS API uses server-side certificate for security. The VTS comes with default server-side certificate. The user is responsible for creating and replacing such certificates if needed.

#### 3.2.1 Installing Certificates

- Key-file: Specifies which file that contains the private key for the certificate  
Copy the key file to /etc/ncs/ssl/cert/host.key
- Cert-file: Specifies which file that contains the server certificate.  
Copy the cert file to /etc/ncs/ssl/cert/host.cert
- restart the VTS server process:  
`sudo service ncs restart`

#### 3.2.2 REST Semantics

- ***Retrieving a Resource***

GET is used to retrieve a representation of a known resource.

The XML representation has the list of container name as the XML document root.

Request query parameters

"deep" : retrieve a resource with all subresources incline

"shallow" : retrieve a resource with no subresources incline

"offset"/"limit" : used to specify a limited set of list entries to retrieve

"select" : used to select which nodes and subresources in a resource to retrieve

- ***Replace a resource***

PUT is used to completely replace a known resource.

- ***Update some properties of a resource***

PATCH RFC 5789 is used to edit a known resource. PATCH cannot be used to change keys of a resource.

- ***Create a Resource***

POST to the parent resource to create a new resource.

- ***DELETE a Resource***

DELETE is used to remove a known resource. DELETE can be used to remove the entire resource or part of it.

## 4 API Reference

### Base URI

Because of multi site support feature in this release, the base URI is changed. Note the highlighted change where you need to provide site id in the path

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<site id>/cisco-vts/>

**Headers: All headers Content-Type, Accept and Authorization should be provided**

**Content-Type:** application/vnd.yang.data+json

OR

**Content-Type:** application/vnd.yang.data+xml

**Accept:** application/vnd.yang.data+json

OR

**Accept:** application/vnd.yang.data+xml

**Authorization:** Basic: (username/password)

## 4.1 Authgroup

The following APIs are used to create or retrieve the authentication groups for which the username and password that will be used to access the devices are stored.

GET

<https://host:8888/api/running/devices/authgroups> - to get list of authgroups.

PATCH

<https://host:8888/api/running/devices/authgroups/> - to incrementally add the authgroup.

### 4.1.1 Payload

```
<authgroups>
<group>
<name>default_device</name>
<umap>
<local-user>admin</local-user><!-----Username used for NCS API authentication--->
<remote-name>admin</remote-name><!-----Username for Device authentication--->
<remote-password>admin</remote-password><!-----Password on Device for user account supplied----->
<remote-secondary-password>admin</remote-secondary-password><!-----used for enable password----->
</umap>
</group>
</authgroups>
```

## 4.2 Device

The following APIs are used to do CRUD operation of the device.

GET

<https://host:8888/api/running/devices/device> - to get list of devices

PUT

<https://host:8888/api/running/devices/device> - to add device to VTS or replace a device

Note the site-id parameter which is added for multi site feature support. A device belongs to only one site

```
{
  "device": {
    "name": "abc123",
    "address": "1.1.1.5",
    "authgroup": "default",
    "device-type": {
```

```
"cli": {  
    "ned-id": "tailf-ned-cisco-nx-id:cisco-nx"  
}  
},  
"vts-service:vts-device-meta-data": {  
    "site-id": "<site id>"  
}  
}  
}  
}
```

## PATCH

<https://host:8888/api/running/devices/device/> - to incrementally add the device (Existing device will not be modified)

### 4.2.1 Payload to add N9K device

```
<device>  
    <name>n9k1</name>  
    <address>1.1.1.1</address>  
    <authgroup>N9k-authgroup1</authgroup>  
    <device-type>  
        <cli>  
            <ned-id>cisco-nx</ned-id>  
            <protocol>ssh</protocol>  
        </cli>  
    </device-type>  
    <ned-settings>  
        <cisco-nx-connection>  
            <method>nxapi</method>  
        </cisco-nx-connection>  
    </ned-settings>  
    <state>  
        <admin-state>unlocked</admin-state>  
        <admin-state-description>changed to xyz</admin-state-description>  
    </state>  
    <device-info>  
        <device-use>LEAF</device-use>  
        <bgp-peering>  
            <bgp-asn>100</bgp-asn>  
            <loopback-if-num>1</loopback-if-num>  
            <loopback-if-ip>10.10.10.0/24</loopback-if-ip>  
        </bgp-peering>  
    </device-info>  
    <vts-device-meta-data>  
        <site-id>your site ID</site-id>  
    </vts-device-meta-data>
```

```
</device>
```

### 4.3 Site CRUD

Following are the APIs for site CRUD operations

#### 4.3.1 To create new site OR to update existing site

(note that site's id is key and can not be updated. Also in 2.6.2 release we do not allow site's vts-data-plane-protocol to be changed from vxlan to mpls and vice a versa after site is created)

POST

<https://<VTCHost>:8888/api/running/vts-service/sites>

```
{  
    "site": {  
        "name": "siteA",  
        "description": "site A description",  
        "id": "<site uuid>",  
        "vts-data-plane-protocol": "cisco-vts-identities:vxlan-encapsulation"  
    }  
}
```

Note that the data-plane-protocol can have one of the two values

cisco-vts-identities:vxlan-encapsulation

or

cisco-vts-identities:mpls-encapsulation

#### 4.3.2 To get list of sites

GET

<https://<VTCHost>:8888/api/running/vts-service/sites>

#### 4.3.3 To get information about specific site

GET

<https://<VTCHost>:8888/api/running/vts-service/sites/site/<site id>>

#### 4.3.4 To Delete a site

DELETE

<https://<VTCHost>:8888/api/running/vts-service/sites/site/<site id>>

### 4.4 Inventory

The following APIs are used to upload / retrieve the inventory of the topology.

GET <https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/hosts> to get list of hosts and their interfaces

GET

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/devices> to get list of device to server mapping

PUT

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/hosts/host/{hostname}{vmm-id}> - to add host info to NCS or replace a hosts information for this device. In case of baremetal hosts, the VMM is VTS

PATCH

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/hosts/host{hostname}{vmm-id}> - to incrementally add the deviceport-server info such as adding a new device interface for the host (Existing info will not be modified)

### 4.4.1 Payload Example

```
<vts-service xmlns="http://cisco.com/ns/yang/vts-service">
  <sites>
    <site>
      <id>8de7d735-594d-464e-a7fc-0d34c44fca31</id>
      <cisco-vts xmlns="http://cisco.com/ns/yang/vts">
        <hosts>
          <host>
            <name>compute1</name>
            <vmm-id>8de7d735-594d-464e-a7fc-0d34c44fca31</vmm-id>
            <host-interfaces>
              <host-interface>
                <device-name>tb3-tor1</device-name>
                <device-port-name>Ethernet1/1</device-port-name>
                <interface-name>eth3</interface-name>
                <connid refcounter="1" >9d45feea-770e-4d16-80f7-
174e41947636<connid>
              </host-interface>
              <host-interface>
                <device-name>n7k2</device-name>
                <device-port-name>Ethernet1/8</device-port-name>
                <interface-name>eth4</interface-name>
                <connid refcounter="1" >6391d7d4-e3fd-42f2-9081-
694fa2aa03ce<connid>
              </host-interface>
            </host-interfaces>
            <type xmlns:vts-ids="http://cisco.com/ns/yang/vts/identities">vts-ids:virtual-
server</type>
            <role xmlns:vts-ids="http://cisco.com/ns/yang/vts/identities">vts-ids:managed-
server</role>
            <ip>172.20.100.30</ip>
```

---

```

</host>
</hosts>
</cisco-vts>
</site>
</sites>
</vts-service>
```

#### 4.4.2 Payload Example with FEX

```

<devices
    xmlns="http://cisco.com/ns/yang/vts"
    xmlns:y="http://tail-f.com/ns/rest"
    xmlns:vts="http://cisco.com/ns/yang/vts">
    <device>
        <name>tb3-tor1</name>
    <ports>
        <port>
            <name>port-channel25</name>
            <connection-type
                xmlns:cisco-vts-

      <device-port-name>Ethernet1/1</device-port-name>
      <interface-name>eth3</interface-name>
      <virtual-switch> ovs-st </virtual-switch>
      <vtf-link> vtf-tor-link </vtf-link>
      <connid refcounter="1" >9d45feea-770e-4d16-80f7-
174e41947636<connid>
    </host-interface>
  </host-interfaces>
  <type xmlns:vts-ids="http://cisco.com/ns/yang/vts/identities">vts-ids:virtual-
server</type>
  <role xmlns:vts-ids="http://cisco.com/ns/yang/vts/identities">vts-ids:managed-
server</role>
  <ip>172.20.100.30</ip>
</host>
```

#### Configuring Tenant Information

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>cisco-vts/tenants/tenant/<name>>

Tenants	Container for set of VTS Tenants
Tenant	List of VTS Tenants
Name	Tenant Name

## Configuring Topology Information

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<id>>

Topologies	Container for set of Topologies belonging to a tenant
Topology	List of Topologies
id	Topology Name

## 4.6 Device-Groups

A device-group can be used to group a set of L2/L3 VTEP devices such that these share a common vlan pool. The VTEPs can be physical or virtual end points. Once added to the device-group, the device specific vlan pools are no longer used.

Operations: CREATE/UPDATE/GET/DELETE

### Create (PUT)

Create a device-group in VTS

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-groups/device-group/<device-group-name>>

Parameter	Value	Description
Name	String	Name of the device group
Type	String	Type of device group. Default “device-group-type”
vmmid	String	VMM ID
devices	-	Container for list of devices
device/name	String	Name of device in VTS inventory
device/type	String	Type of device – physical or virtual – p-vtep/v-vtep

### Sample Payload

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-groups/device-group/tb12-tor-group>

```
"device-group": [
  {
    "name": "tb12-tor-group",
    "type": "device-group-type",
    "vmmid": "6BA0C760-E840-40A4-A949-B06DD18E0998",
    "devices": {
      "device": [
        {
          "name": "tb12-leaf1",
          "type": "p-vtep"
        },
      ]
    }
  }
]
```

```
{
  "name": "tb12-leaf2",
  "type": "p-vtep"
}
]
}
]
```

**Update (PATCH)**

Create a device-group in VTS

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-groups/device-group>

```
"device-group": [
  {
    "name": "tb12-tor-group",
    "type": "device-group-type",
    "vmmid": "6BA0C760-E840-40A4-A949-B06DD18E0998",
    "devices": {
      "device": [
        {
          "name": "tb12-leaf1",
          "type": "p-vtep"
        },
        {
          "name": "tb12-leaf2",
          "type": "p-vtep"
        },
        {
          "name": "tb12-virtual-leaf1",
          "type": "v-vtep"
        }
      ]
    }
  }
]
```

**GET**

Show device-group details

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-groups/device-group/<device-group-name>>

**LIST (GET)**

Show list of all device-groups in the system

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-groups/device-group/>

**DELETE**

Delete a device group.

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-groups/device-group/<device-group-name>>

## 4.7 Device-Interface-Groups

A device-interface-group can be used to group a set of Physical Interface of Nexus 7000 devices so that user can use common dot1Q pool for Overlay Network provisioning. VTS automatically creates a system defined group per interface during inventory upload and users can use this API to control the group members

Operations: CREATE/UPDATE/GET/DELETE

### Create (PUT)

Create a device-interface-group in VTS

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-interface-groups/device-interface-group/<device-interface-group-name>>

Parameter	Value	Description
Name	String	Name of the device Interface group
Type	String	Type of device Interface group. Default “device-interface-group”
Is User Defined Group	Boolean	Flag to determine if the group is user defined or system defined
device-interfaces	-	Container for list of device interfaces
device-interfaces/device-interface	String	device interfaces from devices
device-interface/name	String	Name of the device interface
device-interface/device-name	String	Name of the device the interface belongs to
Device-interface/pool-name	String	Device interface pool this group uses

### Sample Payload

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-interface-groups/device-interface-group/tb12-interface-group>

```
{
  "device-interface-group": {
    "name": "tb12-interface-group",
    "type": "cisco-vts-identities:device-interface-group",
    "is-user-defined-group": true,
    "device-interfaces": [
      "device-interface": [
        {
          "name": "Ethernet1\\1",
          "device-name": "n7k-1-JenShue-VDC1",
        }
      ]
    ]
  }
}
```

```

        "pool-name":" tb12-interface-pool "
    },
    {
        "name":"Ethernet1\2",
        "device-name":"n7k-1-JenShue-VDC1",
        "pool-name":" tb12-interface-pool "
    },
    {
        "name":"Ethernet1\3",
        "device-name":"n7k-2-JenShue-VDC1",
        "pool-name":"tb12-interface-pool"
    }
]
}
}
}

```

### Update (PATCH)

Update a device-interface-group in VTS

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-interface-groups/device-interface-group>

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-interface-groups/device-interface-group/tb12-interface-group>

```

"device-interface-group": [
{
    "name":"tb12-interface-group",
    "type":"cisco-vts-identities:device-interface-group",
    "is-user-defined-group":true,
    "device-interfaces":{
        "device-interface":[
            {
                "name":"Ethernet1\1",
                "device-name":"n7k-1-JenShue-VDC1",
                "pool-name":" tb12-interface-pool "
            },
            {
                "name":"Ethernet1\2",
                "device-name":"n7k-1-JenShue-VDC1",
                "pool-name":" tb12-interface-pool "
            },
            {
                "name":"Ethernet1\3",
                "device-name":"n7k-2-JenShue-VDC1",
                "pool-name":"tb12-interface-pool"
            }
        ]
    }
}
]

```

**GET**

Show device-interface-group details

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-interface-groups/device-interface-group/<device-interface-group-name>>

**LIST (GET)**

Show list of all device-interface-groups in the system

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-interface-groups/device-interface-group/>

**DELETE**

Delete a device interface group.

<https://172.20.100.126:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/device-interface-groups/device-interface-group/<device-interface-group-name>>

## 4.8 Network Extensions

Allows to manipulate network extension for a tenant. Settings changed here would affect all the networks that are inheriting the extension, under the tenant. extend the layer 2 network to core.

**Create (PUT)**

Creates Network Extensions

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/network-extensions>

**Payload**

Parameter	Value	Description
extend-networks-to-core	no/yes	Yes means extend all inheriting networks to core.

**Sample Payload**

```
{
  "network-extensions": {
    "extend-networks-to-core": "yes"
  }
}
```

**GET**

Show network Network Extensions under a tenant <tenant-name>

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/network-extensions>

**DELETE**

Delete Network Extensions under a tenant <tenant-name> and associated resources.

---

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/network-extensions>

## 4.9 Network

Shows/Lists information for creates, updates and deletes of Network. VTS supports IPv4 and IPv6 overlay networks

### Create (PUT)

Create a network in VTS

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/networks/network/<id>>

### Payload

Parameter	Value	Description
admin-state-up	true/false	Admin state of the network up or down
Id	Uuid	Network ID
Name	String	Network name
shared	Boolean	Shared across all tenants
status	active/build/down	Network Status
provider-network-type	gre/trunk/vlan/vxlan	Network Type
provider-physical-network	String	Physical Network Name
router-external	Boolean	External access to Network
extend-to-core	no/yes/none	Extend the l2 network to core. None or empty means the values in inherited from Tenant. yes or no means the value is overridden at network level.
Provider-segmentation-id	String	Segmentation ID
arp-suppression	String	Enable or Disable ARP suppression for Network. By default ARP suppression is Disabled.

### Sample Payload

```
{
  "network":{
    "id":"14528457-1761-4378-bdaf-1e4b2ff5e999",
    "admin-state-up":true,
    "name":"network-1",
    "provider-physical-network":"physnet1",
    "provider-segmentation-id":"1111",
```

```

    "provider-network-type":"cisco-vts-identities:vxlan",
    "router-external":false,
    "extend-to-core":"none",
    "shared":false,
    "status":"cisco-vts-identities:active"
    "arp-suppression":"nwk-arp-suppression-disabled"
}
}

```

**GET**

Show network details associated to one VTS Network under topology <topology-name> of a tenant <tenant-name>.

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/networks/network/<id>>

**LIST (GET)**

Show list of all networks under topology <topology-name> of a tenant <tenant-name>.

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/networks/>

**DELETE**

Delete Network under topology <topology-name> of a tenant <tenant-name> and associated resources.

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/networks/network/<id>>

**4.10 Subnet**

Shows/Lists information for creates, updates and deletes of Subnet. VTS allows only one IPv4 and one IPv6 subnet per network

**Create (PUT)**

Create a subnet in VTS

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/subnets/subnet/<id>>

Parameter	Value	Description
network-id	Uuid	Network ID
Id	Uuid	Subnet ID
Name	String	Subnet name
shared	Boolean	Shared across all tenants
status	active/build/down	Network Status
enable-dhcp	Boolean	True if DHCP is enabled
Cidr	String	The CIDR

gateway-ip	String	The gateway IP address
ip-version	String	IP version 4 or 6
ipv6-ra-mode	String	IPv6 ra configuration mode
ipv6-address-mode	String	IPv6 address configuration mode

**Sample Payload:**

IPv4 subnet:

```
{
  "subnet": {
    "id": "98944325-eb56-56f1-9468-095028d8d36c",
    "network-id": "489ed271-9427-4fa0-85ca-1ca7187d29d1",
    "name": "subnet1",
    "enable-dhcp": true,
    "cidr": "2.2.2.0/24",
    "gateway-ip": "2.2.2.1",
    "ip-version": "4",
    "shared": false
  }
}
```

IPv6 Subnet:

```
{
  "subnet": {
    "id": "98944325-eb56-56f1-9468-095028d8d36c",
    "network-id": "489ed271-9427-4fa0-85ca-1ca7187d29d1",
    "name": "subnet6",
    "enable-dhcp": true,
    "cidr": "1111::0/64",
    "gateway-ip": "1111::1",
    "ip-version": "6",
    "shared": false
  }
}
```

**GET**

Show subnet details associated to one VTS Subnet under topology <topology-name> of a tenant <tenant-name>.

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/subnets/subnet/<id>>

**LIST (GET)**

Show list of all subnets under topology <topology-name> of a tenant <tenant-name>.  
<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/subnets/subnet/>

### **DELETE**

Delete subnet under topology <topology-name> of a tenant <tenant-name> and associated resources.

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/subnets/subnet/<id>>

## 4.11 VM Port

Shows/Lists information for creates, updates and deletes of port

### **Create (PUT)**

Create a port in VTS

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/ports/port/<id>>

Parameter	Value	Description
network-id	uuid	Network ID
Id	uuid	port ID
Name	String	Port name
status	cisco-vts-identities :active/cisco-vts-identities:build/cisco-vts-identities:down	Port status
admin-state-up	boolean	Admin state of the network up or down
connid	uuid	Connection id of the device
tagging	optional/mandatory	Indicates whether a baremetal server tags the packets it sends
binding-host-id	String	Host identifier.
type	cisco-vts-identities:baremetal/cisco-vts-identities:virtual-server	Type of server port.
mac-address	mac-address string or unknown-{32,36}	Port Mac Address

### **Sample Payload:**

```
{
  "port":{
```

```

    "id": "bb42b3c9-1515-4c23-9af7-bfcf1d11750d",
    "status": "cisco-vts-identities:active",
    "tagging": "optional",
    "network-id": "0deeba97-e36b-4e99-b43f-6df7d278655e",
    "binding-host-id": "alibaba-compute5",
    "connid": [
        {
            "id": "2ff81bb9-3b75-4f15-9ef5-6ad03b72cf2e"
        }
    ],
    "fixed-ips": {
        "fixed-ip": [
            {
                "cidr": "10.0.0.10/32",
                "ip-address": "10.0.0.10",
                "subnet-id": "e871cac0-7e39-4808-8684-20e30a6ac7a8"
            }
        ],
        "admin-state-up": "true",
        "type": "cisco-vts-identities:baremetal",
        "mac-address": "unknown-bb42b3c9-1515-4c23-9af7-bfcf1d11750d"
    }
}

```

**Note:** in "fixed-ip", "cidr" for IPv4 can be any IPv4 network address; "cidr" for IPv6 can be any IPv6 network address.

## GET

Show port details associated to one VTS Port under topology <topology-name> of a tenant <tenant-name>, belonging to network with id <id>.

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/ports/port/<id>>

## LIST (GET)

Show list of all ports under topology <topology-name> of a tenant <tenant-name> and network with id <id>.

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/ports/>

## DELETE

Delete port under topology <topology-name> of a tenant <tenant-name> and network with id <id>

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/ports/port/<id>>

## 4.12 Trunk

Shows/Lists information for creates, updates and deletes of trunks.

**Create (PUT)**

Create a trunk in VTS

[https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your\\_site\\_ID>/cisco-vts/trunks/trunk/<id>](https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your_site_ID>/cisco-vts/trunks/trunk/<id>)

Parameter	Value	Description
Id	String	Trunk ID
Name	String	Trunk name
tenant-name	String	Tenant name
topology-id	String	Topology ID
port-id	String	ID of parent port
sub-ports	-	Container for list of subports
sub-ports/port-id	String	Port ID of subport
sub-ports/segmentation-id	String	Segmentation ID of subport
sub-ports/segmentation-type	String	Segmentation type of subport
sub-ports/mac-address	String	MAC address of subport

**Sample Payload:**

```
{
  "trunk": {
    "port-id": "afc235a1-92a5-423f-8093-b4d25652ab69",
    "tenant-name": "admin",
    "topology-id": "admin",
    "sub-ports": [
      {
        "port-id": "5688b4de-e26a-4e66-9542-3c2b47809ea9",
        "segmentation-type": "cisco-vts-identities:vlan",
        "segmentation-id": 1001,
        "mac-address": "fa:16:3e:f6:8f:2e"
      },
      {
        "port-id": "d88eb9a9-86ca-488a-ac64-5a9393dc022f",
        "segmentation-type": "cisco-vts-identities:vlan",
        "segmentation-id": 1002,
        "mac-address": "bb:34:78:e6:44:9d"
      }
    ],
    "id": "b960a3e2-eb9f-43cf-98e7-090ad097d5cd",
    "name": "FIRSTTRUNK"
  }
}
```

**GET**

Show details of a VTS trunk with id &lt;id&gt;

[https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your\\_site\\_ID>/cisco-vts/trunks/trunk/<id>](https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your_site_ID>/cisco-vts/trunks/trunk/<id>)

### LIST (GET)

Show list of all VTS trunks

[https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your\\_site\\_ID>/cisco-vts/trunks/trunk/](https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your_site_ID>/cisco-vts/trunks/trunk/)

### DELETE

Delete a VTS trunk with id <id>

[https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your\\_site\\_ID>/cisco-vts/trunks/trunk/<id>](https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your_site_ID>/cisco-vts/trunks/trunk/<id>)

## 4.13 Router

Shows/Lists information for creates, updates and deletes of Routers

### Create (PUT)

Create a router in VTS

[https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your\\_site\\_ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/routers/router/<id>](https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your_site_ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/routers/router/<id>)

Parameter	Value	Description
network-id	uuid	Network ID
Id	uuid	Router ID
Name	String	Router name
router-gateway	String	External network id, if exists
router-gateway-ip-address	String	Router gateway IPv4 address
router-gateway-ipv6-address	String	Router gateway IPv6 address

### Sample Payload:

```
{
  "router": [
    {
      "id": "d8c58e0e-50ce-4ef8-923e-5d053ef38888",
      "status": "cisco-vts-identities:active",
      "name": "router3",
      "router-gateway": "dc44545b-0b95-4463-aad9-a310102e5f95",
      "router-gateway-ip-address": null,
      "router-gateway-ipv6-address": null
    }
  ]
}
```

### GET

Show router details associated to one VTS router under topology <topology-name> of a tenant <tenant-name> belonging to a network with id <id>

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/routers/router/<id>>

### LIST (GET)

Show list of all routers under topology <topology-name> of a tenant <tenant-name> belonging to a network with id <id>

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/routers/router/>

### DELETE

Delete router under topology <topology-name> of a tenant <tenant-name> belonging to a network with id <id>

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/routers/router/<id>>

## 4.14 Router Interfaces

Shows/Lists information for creates, updates and deletes of Interface

### Create (PUT)

Create an interface in VTS

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/interfaces/interface/<id>>

Parameter	Value	Description
Id	uuid	Interface ID
subnet-id	uuid	Subnet ID
router-id	uuid	Router ID

### Sample Payload:

```
{
  "interface": [
    {
      "subnet-id": "3faf211d-1fca-4aff-9c1c-086cda772bae",
      "router-id": "3faf211d-1fca-4aff-9c1c-086cda777777",
    }
  ]
}
```

```
}
```

## GET

Show interface details associated to one VTS Interface under topology <topology-name> of a tenant <tenant-name>

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/interfaces/interface/<id>>

## LIST (GET)

Show list of all interfaces under topology <topology-name> of a tenant <tenant-name>

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/interfaces/>

## DELETE

Delete interface under topology <topology-name> of a tenant <tenant-name>

<https://<vtc-ip>:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/tenants/tenant/<tenant-name>/topologies/topology/<topology-name>/interfaces/interface/<id>>

## 4.15 Infrastructure Policy

The following APIs are used to do CRUD operations on the infrastructure policy.

### 4.15.1 Administrative Domains

The following APIs are used to perform CRUD operations on administrative domains.

#### 4.15.1.1 URLs

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains>

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/admin-domain/{name}>

#### 4.15.1.2 Payload fields

Field	Data Type	Description
Name	string	Name of the administrative domain. This field is required.

#### 4.15.1.3 Payload example

```
{
  "name": "my-admin-domain"
}
```

### 4.15.2 Layer 2 Gateway Groups

The following APIs are used to perform CRUD operations on layer 2 gateways groups.

#### 4.15.2.1 URIs

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/administrative-domain/{name}/l2-gateway-groups/l2-gateway-group>

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/administrative-domain/{domain}/l2-gateway-groups/l2-gateway-group{name2}>

#### 4.15.2.2 Payload fields

Field	Data Type	Description
Name	string	Name of the L2 gateway group. This field is required.

#### 4.15.2.3 Payload example

```
{
  "name": "my-L2"
}
```

### 4.15.3 Devices in a Layer 2 Gateway Groups

The following APIs are used to perform CRUD operations on devices belonging to a layer 2 gateways group.

#### 4.15.3.1 URIs

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/administrative-domain/{name}/l2-gateway-groups/l2-gateway-group/{name2}/devices/device/>

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/administrative-domain/{domain}/l2-gateway-groups/l2-gateway-group/{name2}/devices/device/{name3}>

#### 4.15.3.2 Payload fields

Field	Data Type	Description
Name	string	Name of the device acting as L2 gateway. This field is required.

#### 4.15.3.3 Payload example

```
{
  "name": "my-l2-device"
```

```

    }
}
```

#### 4.15.4 Policy Parameters for a Layer 2 Gateway Group

The following APIs are used to perform CRUD operations on policy parameters for a layer 2 gateways group.

##### 4.15.4.1 URIs

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/administrative-domain/{name}/l2-gateway-groups/l2-gateway-group/{name2}/policy-parameters`

##### 4.15.4.2 Payload fields

Field	Data Type / Value	Description
distribution-mode	“decentralized-l2”	Mode of distribution
control-plane-protocol	“bgp-evpn” or “flood-and-learn”	Control plane protocol used to learn end point addresses.
arp-suppression	Flag	Enables BGP EVPN ARP suppression.
packet-replication	“multicast” or “ingress-replication”	Packet replication mechanism. It determines how packets sent to multiple recipients are replicated, so that each recipient gets a copy.

##### 4.15.4.3 Payload example

```
{
  "distribution-mode": "decentralized-l2",
  "arp-suppression": null
}
```

#### 4.15.5 Parent of a Layer 2 Gateway Group

The following APIs are used to perform CRUD operations to assign a parent group to a layer 2 gateways group.

##### 4.15.5.1 URIs

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/administrative-domain/{name}/l2-gateway-groups/l2-gateway-group/{name2}`

#### 4.15.5.2 Payload fields

Note that the ad-l3-gw-parent and l3-gw-parent are mutually exclusive. That is, only one of them can be included in a request (or response) to VTS. l3-dc-gw-parent can be set in parallel to enable Layer 2 VNI service, extend the network to core.

Field	Data Type	Description
ad-l3-gw-parent	string	This L2 group's L3 gateway parent in the current administrative domain
l3-gw-parent	string	This L2 group's L3 gateway parent in the infrastructure policy hierarchy
l3-dc-gw-parent	string	This group's L3 datacenter gateway parent in the infrastructure policy hierarchy.

#### 4.15.5.3 Payload example

```
{
  "ad-l3-gw-parent": "my-l3-group"
}
```

or for L2 VNI service extension.

```
{
  "ad-l3-gw-parent": "my-l3-group",
  "l3-dc-gw-parent": "my-dc-group"
}
```

#### 4.15.6 Layer 3 Gateway Groups in an Administrative Domain

The following APIs are used to perform CRUD operations on layer 3 gateways groups in an administrative domain.

##### 4.15.6.1 URIs

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/administrative-domain/{name}/l3-gateway-groups/l3-gateway-group>

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/administrative-domain/{domain}/l3-gateway-groups/l3-gateway-group{name2}>

#### 4.15.6.2 Payload fields

Field	Data Type	Description
Name	string	Name of the L3 gateway group. This field is required.

#### 4.15.6.3 Payload example

```
{
  "name": "my-l3-group"
}
```

#### 4.15.7 Devices in a Layer 3 Gateway Group in an Administrative Domain

The following APIs are used to perform CRUD operations on devices belonging to a layer 3 gateways group in an administrative domain.

##### 4.15.7.1 URIs

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/administrative-domain/{name}/l3-gateway-groups/l3-gateway-group/{name2}/devices/device/`

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/administrative-domain/{domain}/l3-gateway-groups/l3-gateway-group/{name2}/devices/device/{name3}`

##### 4.15.7.2 Payload fields

Field	Data Type	Description
Name	string	Name of the device acting as L3 gateway in an administrative domain. This field is required.

#### 4.15.7.3 Payload example

```
{
  "name": "my-l3-device"
}
```

#### 4.15.8 Policy Parameters for a Layer 3 Gateway Group in an Administrative Domain

The following APIs are used to perform CRUD operations on policy parameters for a layer 3 gateways group in an administrative domain.

##### 4.15.8.1 URIs

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/administrative-domain/{name}/l3-gateway-groups/l3-gateway-group/{name2}/policy-parameters`

##### 4.15.8.2 Payload fields

Field	Data Type	Description
distribution-mode	“decentralized-l3” or “centralized-l3”	Mode of distribution
control-plane-protocol	“bgp-evpn” or “flood-and-learn”	Control plane protocol used to learn end point addresses.

arp-suppression	Flag	Enables BGP EVPN ARP suppression.
packet-replication	“multicast” or “ingress-replication”	Packet replication mechanism. It determines how packets sent to multiple recipients are replicated, so that each recipient gets a copy.

#### 4.15.8.3 Payload example

```
{
  "packet-replication": "multicast"
}
```

#### 4.15.9 Parent of a Layer 3 Gateway Group in an Administrative Domain

The following APIs are used to perform CRUD operations to assign a parent group to a layer 3 gateways group in an administrative domain.

##### 4.15.9.1 URIs

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/admin-domains/administrative-domain/{name}/l3-gateway-groups/l3-gateway-group/{name2}>

##### 4.15.9.2 Payload fields

Note that the fields below are mutually exclusive. That is, only one of them can be included in a request (or response) to VTS.

Field	Data Type	Description
l3-dc-gw-parent	string	This L3 group's L3 datacenter gateway parent in the infrastructure policy hierarchy.
l3-dci-parent	string	This L3 group's datacenter gateway interconnect parent

#### 4.15.9.3 Payload example

```
{
  "l3-dc-gw-parent": "my-dc-group"
}
```

#### 4.15.10 Layer 3 Gateway Groups

The following APIs are used to perform CRUD operations on layer 3 gateways groups.

**4.15.10.1 URIs**

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-gateway-groups/l3-gateway-group`

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-gateway-groups/l3-gateway-group{name}`

**4.15.10.2 Payload fields**

Field	Data Type	Description
Name	string	Name of the L3 gateway group. This field is required.

**4.15.10.3 Payload example**

```
{
  "name": "my-other-l3-group"
}
```

**4.15.11 Devices in a Layer 3 Gateway Group**

The following APIs are used to perform CRUD operations on devices belonging to a layer 3 gateways group.

**4.15.11.1 URIs**

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-gateway-groups/l3-gateway-group/{name}/devices/device/`

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-gateway-groups/l3-gateway-group/{name}/devices/device/{name2}`

**4.15.11.2 Payload fields**

Field	Data Type	Description
Name	string	Name of the device acting as L3 gateway in an administrative domain. This field is required.

**4.15.11.3 Payload example**

```
{
  "name": "my-other-l3-device"
}
```

**4.15.12 Policy Parameters for a Layer 3 Gateway Group**

The following APIs are used to perform CRUD operations on policy parameters for a layer 3 gateways group.

**4.15.12.1 URIs**

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-gateway-groups/l3-gateway-group/{name}/policy-parameters>

**4.15.12.2 Payload fields**

Field	Data Type	Description
distribution-mode	“decentralized-l3” or “centralized-l3”	Mode of distribution
control-plane-protocol	“bgp-evpn” or “flood-and-learn”	Control plane protocol used to learn end point addresses.
arp-suppression	Flag	Enables BGP EVPN ARP suppression.
packet-replication	“multicast” or “ingress-replication”	Packet replication mechanism. It determines how packets sent to multiple recipients are replicated, so that each recipient gets a copy.

**4.15.12.3 Payload example**

```
{
  "distribution-mode": "decentralized-l2",
  "arp-suppression": null
}
```

**4.15.13 Parent of a Layer 3 Gateway Group in an Administrative Domain**

The following APIs are used to perform CRUD operations to assign a parent group to a layer 3 gateways group in an administrative domain.

**4.15.13.1 URIs**

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-gateway-groups/l3-gateway-group/{name2}>

**4.15.13.2 Payload fields**

Note that the fields below are mutually exclusive. That is, only one of them can be included in a request (or response) to VTS.

Field	Data Type	Description
l3-dc-gw-parent	string	This L3 group's L3 datacenter gateway parent in the infrastructure policy hierarchy.

l3-dci-parent	string	This L3 group's datacenter gateway interconnect parent
---------------	--------	--

**4.15.13.3 Payload example**

```
{
  "l3-dci-parent": "my-dci-group"
}
```

**4.15.14 Data Center Gateway Groups**

The following APIs are used to perform CRUD operations on data center gateway groups.

**4.15.14.1 URIs**

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-dc-gateway-groups/l3-dc-gateway-group>

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-dc-gateway-groups/l3-dc-gateway-group{name}>

**4.15.14.2 Payload fields**

Field	Data Type	Description
Name	string	Name of the data center gateway group. This field is required.

**4.15.14.3 Payload example**

```
{
  "name": "my-dc-group"
}
```

**4.15.15 Devices in a Data Center Gateway Group**

The following APIs are used to perform CRUD operations on devices belonging to a data center gateway group.

**4.15.15.1 URIs**

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-dc-gateway-groups/l3-dc-gateway-group/{name}/devices/device/>

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-dc-gateway-groups/l3-dc-gateway-group/{name}/devices/device/{name2}>

**4.15.15.2 Payload fields**

Field	Data Type	Description
Name	string	Name of the device acting as data center gateway This field is required.

**4.15.15.3 Payload example**

```
{
  "name": "my-dc-device"
}
```

**4.15.16 Policy Parameters for a Data Center Gateway Group**

The following APIs are used to perform CRUD operations on policy parameters for a data center gateway group.

**4.15.16.1 URIs**

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-dc-gateway-groups/l3-dc-gateway-group/{name}/policy-parameters>

**4.15.16.2 Payload fields**

Field	Data Type	Description
distribution-mode	“decentralized-l3” or “centralized-l3”	Mode of distribution

**4.15.16.3 Payload example**

```
{
  "distribution-mode": "decentralized-l3"
}
```

**4.15.17 Parent of a Data Center Gateway Group**

The following APIs are used to perform CRUD operations to assign a parent group to a data center gateway group.

**4.15.17.1 URIs**

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-gateway-groups/l3-gateway-group/{name}>

**4.15.17.2 Payload fields**

Field	Data Type	Description
l3-dci-parent	string	This data center gateway group's datacenter gateway interconnect parent

**4.15.17.3 Payload example**

```
{
  "l3-dci-parent": "my-dci-group"
}
```

**4.15.18 Data Center Interconnect Groups**

The following APIs are used to perform CRUD operations on data center interconect groups.

**4.15.18.1 URIs**

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-dc-gateway-groups/l3-dci-group`

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-dc-gateway-groups/l3-dci-group{name}`

**4.15.18.2 Payload fields**

Field	Data Type	Description
Name	string	Name of the data center gateway group. This field is required.

**4.15.18.3 Payload example**

```
{
  "name": "my-dci-group"
}
```

**4.15.19 Devices in a Data Center Gateway Group**

The following APIs are used to perform CRUD operations on devices belonging to a data center gateway group.

**4.15.19.1 URIs**

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-dc-gateway-groups/l3-dci-group{name}/devices/device/`

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-dc-gateway-groups/l3-dci-group{name}/devices/device{name2}`

**4.15.19.2 Payload fields**

Field	Data Type	Description
Name	string	Name of the device acting as data center gateway This field is required.

**4.15.19.3 Payload example**

```
{
  "name": "my-dci-device"
}
```

**4.15.20 Attach Stitching profile in a Data Center Interconnect group**

The following APIs are used to perform CRUD operations on stitching profiles belonging to a data center interconnect group.

**4.15.20.1 URIs**

`https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-dci-gateway-groups/l3-dci-group{name}/stitching-profiles/stitching-profile{id}`

**4.15.20.2 Payload fields**

Field	Data Type	Description
Id	String	Reference to the stitching profile id.

**4.15.20.3 Payload example**

```
{
  "id": "bc993e8c-6b4c-41c2-a4b4-46fc4dc1d3a2"
}
```

**4.15.21 Provide redundancy group parameters in a Data Center Interconnect group**

The following APIs are used to perform CRUD operations on redundancy group belonging to a data center interconnect group.

**4.15.21.1 URIs**

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/infrastructure-policy/l3-dci-gateway-groups/l3-dci-group/{name}/redundancy-group>

**4.15.21.2 Payload fields**

Field	Data Type	Description
Iccp group id	String	VXLAN (Fabric) Group Number Or MPLS (Core) Group Number Based on group type
Group-type	iccp-group-type	Possible values “iccp-fabric-group” or “iccp-core-group”
Esi – core-esi	String (9 octets)	Ethernet segment id for NVE overlay if configured.

**4.15.21.3 Payload example**

```
{
  "iccp": {
    "groups": {
      "group": [
        {
          "id": 11,
          "group-type": "iccp-fabric-group"
        },
        {
          "id": 12,
          "group-type": "iccp-core-group"
        }
      ]
    }
  }
}
```

```

        }
    ]
}
},
"esi":{
    "core-esi":"88.00.00.00.00.00.00.01"
}
}

```

## 4.16 Route Reflectors

### 4.16.1 Route Reflector Mode

The following APIs are used to perform CRUD operations on the route reflector mode.

#### 4.16.1.1 URIs

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/global-settings>

#### 4.16.1.2 Payload fields

Field	Data Type	Description
route-reflector-mode	“global-rr” or “in-line-rr”	Determines how the route reflector operate

#### 4.16.1.3 Payload example

```
{
    "route-reflector-mode": "global-rr";
}
```

## 4.16.2 Global Route Reflectors

The following APIs are used to perform CRUD operations on the set of global route reflectors.

#### 4.16.2.1 URIs

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/global-settings/global-route-reflectors/global-route-reflector>

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/global-settings/global-route-reflectors/global-route-reflector/{name}>

#### 4.16.2.2 Payload fields

Field	Data Type	Description
name	string	Name of the route reflector

#### 4.16.2.3 Payload example

```
{
    "name": "my-first-route-reflector"
}
```

## 4.17 Global Settings

The following APIs are used to do CRUD operations on global settings.

### 4.17.1 Anycast Gateway Address

The following APIs are used to perform CRUD operations on the common MAC address for all L2 Gateway devices on the Infrastructure Policy hierarchy.

#### 4.17.1.1 URIs

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/global-settings/anycast-gateway/> anycast-gw-address

#### 4.17.1.2 Payload fields

Field	Data Type	Description
anycast-gw-address	MAC address e.g.: AA:BB:CC:DD:EE:FF	Common MAC address for all L2 Gateway devices

#### 4.17.1.3 Payload example

```
{
  "anycast-gw-address": "00:11:22:33:44:55";
}
```

### 4.17.2 VTF Mode

The following APIs are used to perform CRUD operations on VTF mode to be used in the system.

#### 4.17.2.1 URIs

<https://host:8888/api/running/vts-service/sites/site/<your site ID>/cisco-vts/global-settings/vtf-mode-config/vtf-mode>

Field	Data Type	Description
vtf-mode	vtf-mode-enum values: l2, vtep	Global settings for the mode of operation of VTF mode.

## 4.18 Vcenter VTS Plugin API

Current VTS-VCenter plugin supports network provisioning operations through VCenter GUI extensions.

NOTE: The user has to log into vSphere WebClient and enter NCS credentials on the VTS plugin, before any of the rest calls are made.

**Base URI:**

<https://<vCenterIP>:9443/eventMonitorDaemon/EventMonitorWebService>

**Headers**

- 1.) Create/POST – Content-type – “application/json”
- 2.) Delete – Content-type – “text/plain”
- 3.) Authentication - (Key –Authorization, Value – (vc-username/password) )

**4.18.1 Resource: Network****Create**

POST	/network/	Creates a new network
------	-----------	-----------------------

**Sample Payload:**

```
{
  "network": {
    "name": "TestNetwork1",
    "admin-state-up": "true",
    "provider-physical-network": "vlan",
    "provider-network-type": "vts:vxlan",
    "status": "vts:ACTIVE",
    "router-external": "false",
    "tenant-name": "Tenant1",
    "dcname": "DatacenterSample",
    "shared": "true"
  }
}
```

**Note:**

“shared” is the attribute which indicates the network created is Shared Network or not. It is optional. Set it to “true” if you want the network to be a Shared Network. If “shared” attribute is not in the payload, by default it is set to “false”.

**Lists**

GET	/network/	Lists all the existing networks
-----	-----------	---------------------------------

**Sample Payload:**

```
{
  "network": [
    {
      "admin-state-up": "true",
      "name": "net8",
      "provider-network-type": "vts:vxlan",
      ...
    }
  ]
}
```

```

"provider-physical-network":"vlan",
"router-external":"false",
"status":"vts:ACTIVE",
"tenant-id":"tenant1",
"tenant-name":"tenant1"
},
{"admin-state-up":"true",
"name":"net9",
"provider-network-type":"vts:vxlan",
"provider-physical-network":"vlan",
"router-external":"false",
"status":"vts:ACTIVE",
"tenant-id":"tenant1",
"tenant-name":"tenant1",
} ]
}

```

### Delete

		Deletes an existing network given its name and data center name on which it resides.
DELETE	/network/{network_name}?dcname={dcname}	

### Show

GET	/network/{network_name}/	Lists details of given network named {network_name}
-----	--------------------------	---

#### Sample Payload:

```

{"network":
{"admin-state-up":"true",
"name":"net8",
"provider-network-type":"vts:vxlan",
"provider-physical-network":"vlan",
"router-external":"false",
"status":"vts:ACTIVE",
"tenant-id":"D32508B0-40FC-27A2-B78F-462A08AB44A3",
"tenant-name":"tenant1",
}}

```

### 4.18.2 Resource: Subnet

#### Create

POST	/subnet/	Creates a new subnet
------	----------	----------------------

#### Sample Payload:

```
{
  "subnet": [
    {
      "cidr": "29.0.0.0/24",
      "enable-dhcp": "false",
      "gateway-ip": "29.0.0.1",
      "ip-version": "4",
      "name": "Subnet23",
      "network-id": "67f75f3d-5cee-45f3-b327-f32885ef8a60",
      "shared": "false",
      "tenant-id": "tenant1",
      "tenant-name": "tenant1"
    }
  ]
}
```

## Lists

GET	/subnet	Lists all the existing subnets
-----	---------	--------------------------------

## Sample Payload:

```
{
  "subnet": [
    {
      "cidr": "19.0.0.0/24",
      "enable-dhcp": "false",
      "gateway-ip": "19.0.0.1",
      "id": "58717685-c9d1-4aeb-918e-3e0f37034ab5",
      "ip-version": "4",
      "name": "Subnet13",
      "network-id": "67f75f3d-5cee-45f3-b327-f32885ef8a60",
      "shared": "false",
      "tenant-id": "tenant1",
      "tenant-name": "tenant1"
    },
    {
      "cidr": "29.0.0.0/24",
      "enable-dhcp": "false",
      "gateway-ip": "29.0.0.1",
      "id": "c626fc93-0708-45eb-b578-0edee528736d",
      "ip-version": "4",
      "name": "Subnet23",
      "network-id": "67f75f3d-5cee-45f3-b327-f32885ef8a60",
      "shared": "false",
      "tenant-id": "tenant1",
      "tenant-name": "tenant1"
    }
  ]
}
```

## Delete

DELETE	/subnet/{subnet_name}/	Deletes a subnet named {subnet_name}
--------	------------------------	--------------------------------------

**Show**

GET	/subnet/{subnet_name}/	Lists details of given subnet named {subnet_name}
-----	------------------------	---

**Sample Payload:**

```
{
  "subnet": {
    "cidr": "29.0.0.0/24",
    "enable-dhcp": "false",
    "gateway-ip": "29.0.0.1",
    "id": "c626fc93-0708-45eb-b578-0edee528736d",
    "ip-version": "4",
    "name": "Subnet23",
    "network-id": "67f75f3d-5cee-45f3-b327-f32885ef8a60",
    "shared": "false",
    "tenant-id": "tenant1",
    "tenant-name": "tenant1"
  }
}
```

**4.18.3 Resource: Router****Create**

POST	/router	Creates a new router
------	---------	----------------------

**Sample Payload:**

```
{
  "router" : [
    {
      "status" : "ACTIVE",
      "name" : "Router100",
      "tenant-id" : "Tenant1",
      "vni_number" : 5170,
      "router-gateway" : null
    }
  ]
}
```

**Lists**

GET	/router	Lists all the existing routers
-----	---------	--------------------------------

**Sample Payload:**

```
{
  "router": [
    {
      "id": "4b4bb642-3238-4d31-acb0-56e90a19cf01",
      "name": "Router2",
    }
  ]
}
```

```

    "status": "vts:ACTIVE",
    "tenant-id": "tenant1",
    "vni_number": "12007"
},
{
    "id": "4d602cb8-4f93-43d1-87e0-fd943f18642e",
    "name": "Router5",
    "status": "vts:ACTIVE",
    "tenant-id": "tenant1",
    "vni_number": "12002"
}
]
}

```

**Delete**

DELETE	/router/{router_name}/	Deletes a router named {router_name}
--------	------------------------	--------------------------------------

**Show**

GET	/router/{router_name}/	Lists details of given router named {router_name}
-----	------------------------	---

**Sample Payload:**

```
{
    "router": {
        "id": "4d602cb8-4f93-43d1-87e0-fd943f18642e",
        "name": "Router5",
        "status": "vts:ACTIVE",
        "tenant-id": "tenant1",
        "vni_number": "12002"
    }
}
```

**4.18.4 Resource: Interface****Create**

POST	/interface	Attach Interface to the router
------	------------	--------------------------------

**Sample Payload:**

```
{
    "interfaces": [
        {
            "subnet-id": "aabc0bbf-1c63-46a7-99b6-8c7fa91a9ae6",
            "router-id": "aac12354-3573-4472-9370-5e2726bc27eb",
            "ip-address": "46.0.0.1",
            "port-create": "l3:none"
        }
    ]
}
```

**Lists**

GET	/interface	Lists all the existing interfaces
-----	------------	-----------------------------------

**Sample Payload:**

```
{
  "interfaces": [
    {
      "subnet-id": "114d1323-2458-413f-860d-20bed461fc0b",
      "router-id": "04d014f7-a799-43c6-9443-d075495a2e3c",
      "ip-address": "29.0.0.1",
      "port-create": "l3:none"
    },
    {
      "subnet-id": "909953fc-9b5c-495d-b428-5464d969101b",
      "router-id": "04d014f7-a799-43c6-9443-d075495a2e3c",
      "ip-address": "14.0.1.1",
      "port-create": "l3:none"
    }
  ]
}
```

**Show**

GET	/interface/{subnet_name}/	Lists details of given interface with subnet name as {subnet_name} }
-----	---------------------------	--

**Sample Payload:**

```
{"interfaces" : [{
  "subnet-id": "114d1323-2458-413f-860d-20bed461fc0b",
  "router-id": "04d014f7-a799-43c6-9443-d075495a2e3c",
  "ip-address": "29.0.0.1",
  "port-create": "l3:none"
}]}
```

**Delete**

DELETE	/interface/{subnet_name}/	Detaches subnet named {subnet_name} from router
--------	---------------------------	---

**External Network Attach**

POST	/interface/{router_name}/{external_name}?action=attach	Attaches external network named {external_name} to router {router_name}
------	--	---

**External Network Detach**

POST	/interface/{router_name}/{external_name}?action=detach	Detaches external network named {external_name} to router {router_name}
------	--	---

## 4.19 L3 Service Extension Template API

### 4.19.1 Create a L3 service extension template

POST	/vts-service/sites/site/<site_id>/templates	Create a new L3 service extension template in VTS
------	---	---

#### Sample Payload:

```
{
  "template": [
    {
      "name": "Sample L3 Template",
      "description": "A sample L3 service extension template",
      "type": "cisco-vts-templates:l3-service-extension",
      "created-on": "2016-05-31T09:05:00",
      "modified-on": "2016-05-31T09:30:00",
      "l3-service-extension-template": {
        "schema-revision-date": "2016-05-31",
        "schema-namespace": "http://tail-f.com/ned/cisco-nx",
        "keypath-values": {
          "keypath-value": [
            {
              "keypath": "config/nx:router/bgp{100}/vrf",
              "value": "{\"vrf\":{\"name\":\"admin-test\"}}"
            },
            {
              "keypath": "config/nx:vrf/context{admin-TestRouter}/ip",
              "value": "{\"ip\":{\"domain-name\":\"TestDomain\"}}"
            }
          ]
        }
      }
    }
  ]
}
```

```

    ]
}

```

**Fields:**

Field Name	Possible Value	Mandatory
name	A non-empty string with a maximum of 128 characters	Y
description	A string with a maximum of 128 characters	N
Type	The type for L3 service extension template is “cisco-vts-templates:l3-service-extension”	Y
created-on	Date-time information in the format CCYY-MM-DDTHH:MM:SS	N (This will be system generated)
modified-on	Date-time information in the format CCYY-MM-DDTHH:MM:SS	N (This will be system generated)
schema-revision-date	String in YYYY-MM-DD format indicating the schema yang's revision date	Y (if the l3-service-extension template container is specified)
schema-namespace	Namespace for the service extension schema	Y (if the l3-service-extension template container is specified)
Keypath	A unique path to the service extension config	Y (if a keypath is to be added)
value	The config value (in valid JSON format) for the corresponding key path	Y (if a keypath is specified)

**4.19.2 Updating a L3 service extension template**

\*Note: When updating a template, the "modified-on" field is a REQUIRED field in the payload. This is to avoid the situation where a user is updating an older version of a template when a newer version is available. A user can get the "modified-on" value upon retrieving a template.

If the "modified-on" value in the latest version of the template does not match with the "modified-on" value sent in the payload of the template update request, the update request will be REJECTED, in which case the user will need to fetch the latest "modified-on" value again by retrieving the latest version of the template.

PUT	/vts-service/sites/site/<site_id>/templates/template/<template_name>	Update a L3 service extension template
-----	--	--

**Sample Payload:**

```
{
  "template": [
    {
      "name": "Sample L3 Template",
      "description": "Updated description",
      "type": "cisco-vts-templates:l3-service-extension",
      "created-on": "2016-05-31T09:05:00",
      "modified-on": "2016-05-31T09:30:00",
      "l3-service-extension-template": {
        "schema-revision-date": "2016-05-31",
        "schema-namespace": "http://tail-f.com/ned/cisco-nx",
        "keypath-values": {
          "keypath-value": [
            {
              "keypath": "config/nx:router/bgp{100}/vrf",
              "value": "{\"vrf\":{\"name\":\"updated-vrf-name\"}}"
            },
            {
              "keypath": "config/nx:vrf/context{admin-TestRouter}/ip",
              "value": "{\"ip\":{\"domain-name\":\"updated-domain-name\"}}"
            }
          ]
        }
      }
    }
  ]
}
```

**4.19.3 Get List of Templates**

\*Note: This API will get a list of all templates in the system, including both Route and L3 Service Extension templates.

GET	/vts-service/sites/site/<site_id>/templates	Retrieve list of templates
-----	---	----------------------------

**Sample Payload:**

```
{
  "cisco-vts-templates:templates":{
    "template":[
      {
        "name":"Sample_Route_Template"
      },
      {
        "name":"Sample_L3_Template"
      },
      {
        "name":"Another_L3_Template"
      }
    ]
  }
}
```

**4.19.4 Get a specific template using name**

GET	/vts-service/sites/site/<site_id>/templates/template/<template_name>	Gets details about a particular template
-----	--	--

**Sample Payload:**

```
{
  "cisco-vts-templates:template":{
    "name":"Sample_L3_Template",
    "description":"A sample L3 service extension template",
    "type":"cisco-vts-templates:l3-service-extension",
    "created-on":"2016-05-31T09:05:00",
    "modified-on":"2016-05-31T09:30:00",
    "l3-service-extension-template":{
      "schema-revision-date":"2016-05-31",
      "schema-namespace":"http://tail-f.com/ned/cisco-nx",
      "keypath-values":{
        "keypath-value":[
          {
            "keypath":"config/nx:router/bgp{100}/vrf",
            "value":"{\\"vrf\\":{\\"name\\\":\"updated-vrf-name\\\"}}"
          },
          {
            "keypath":"config/nx:vrf/context{admin-TestRouter}/ip",
            "value":"{\\"ip\\\":{\\"domain-name\\\":\"updated-domain-name\\\"}}"
          }
        ]
      }
    }
  }
}
```

```

        ]
    }
}
}
```

#### 4.19.5 Delete all templates

\*Note: This API will delete all templates in the system, including both Route and L3 Service Extension templates.

DELETE	/vts-service/sites/site/<site_id>/templates	Deletes all templates. Note: A template can only be deleted if it is not currently attached to a Tenant or Router.
--------	---	---

#### 4.19.6 Delete a template identified by name

DELETE	/vts-service/sites/site/<site_id>/templates/template/<template-name>	Deletes a template identified by name. Note: A template can only be deleted if it is not currently attached to a Tenant or Router.
--------	--	---

#### 4.19.7 Create a template device group

\*Note: Currently VTS does not support the modification of the device list using PUT/PATCH API once the template device group is created. To add or remove devices from the template device group, a user can first use the DELETE API to delete the existing template device group, and then use the POST API to create a new template device group with the updated device list.

POST	/vts-service/sites/site/<site_id>/cisco-vts/template-device-groups	Create a template device group
------	--	--------------------------------

##### Sample Payload:

```
{
  "template-device-group": [
    {
      "device-group-name": "system-device-group-1",
      "devices": {
        "device": [
          ...
        ]
      }
    }
  ]
}
```

```
{
  "name": "vts-142-tor1"
}
]
}
}
]
}
```

**Fields:**

Field Name	Possible Value	Mandatory
device-group-name	A non-empty string with a maximum of 128 characters. A device group name of “ALL” is used to indicate that the device group contains all devices, in which case the name field will have a value of “*”.	Y
Name	The name of the device that belongs to this device group. In the case where the device-group-name is “ALL”, this field will have a value of “*”.	Y

**4.19.8 Get a list of all template device groups**

GET	/vts-service/sites/site/<site_id>/cisco-vts/template-device-groups	Get a list of all the template device groups
-----	--	--

**Sample Payload:**

```
{
  "template-device-groups": [
    {
      "template-device-group": [
        {
          "device-group-name": "system-device-group-1",
          "devices": [
            {
              "device": [
                {
                  "name": "vts-142-tor1"
                }
              ]
            }
          ]
        }
      ],
    }
  ],
}
```

```
{
  "device-group-name": "system-device-group-2",
  "devices": {
    "device": [
      {
        "name": "vts-144-tor2"
      }
    ]
  }
}
```

#### 4.19.9 Get a specific template device group

GET	/vts-service/sites/site/<site_id>/cisco-vts/template-device-groups/template-device-group/<name_of_device_group>	Get a specific template device group
-----	---	--------------------------------------

##### Sample Payload:

```
{
  "template-device-group": [
    {
      "device-group-name": "system-device-group-1",
      "devices": {
        "device": [
          {
            "name": "vts-142-tor1"
          }
        ]
      }
    }
  ]
}
```

#### 4.19.10 Delete a specific template device group

DELETE	/vts-service/sites/site/<site_id>/cisco-vts/template-device-groups/template-device-group/<name_of_device_group_to_be_deleted>	Delete a given template device group
--------	---	--------------------------------------

---

#### 4.19.11 Attach L3 service extension template to a router

Step 1: Associate template to device(s)

Refer to section “Create a template device group” to associate an existing L3 service extension template to a list of devices.

Step 2: Associate template to a router

PATCH	/vts-service/sites/site/<site_id>/cisco-vts/template-target-maps	Attaches an existing l3 service extension template to a router
-------	--	--

#### Sample Payload:

```
{
  "template-target-maps":{
    "template-target-map":[
      {
        "template-target-id":" /vts-service:vts-service/sites/site{004dbc7e-c68b-4332-9075-ec823b03615a}/vts:cisco-vts/tenants/tenant{Ten1}/topologies/topology{Z1}/routers/router{94397469-07fa-4f7c-933c-2a588cd69a50} ",
        "template-target-type":"router-target",
        "template-type":"cisco-vts-templates:l3-service-extension",
        "template-name":"Sample L3 Template",
        "device-group-id":"system-device-group-1",
        "last-changed":"2018-08-29T12:00:00-00:00",
      }
    ]
  }
}
```

#### Fields:

Field Name	Possible Value	Mandatory
template-target-id	The full path to the router.	Y
template-target-type	The template target type is “router-target”.	N
template-type	The template type for L3 service extension template is	Y

	“cisco-vts-templates:l3-service-extension”	
template-name	The name of the template to be associated.	Y
device-group-id	The name of the device group indicating the group of devices to be applied for this template-target association.	N
last-changed	A timestamp indicating when template configuration applied on devices has changed.	N

#### 4.19.12 Get a list of all the existing L3 service extension template associations

GET	/vts-service/sites/site/<site_id>/cisco-vts/template-target-maps	Gets a list of all the L3 service extension templates that are currently associated with a router
-----	--	---

##### Sample Payload:

```
{
  "template-target-maps": [
    {
      "template-target-map": [
        {
          "template-target-id": "/vts-service:vts-service/sites/site{004dbc7e-c68b-4332-9075-ec823b03615a}/vts:cisco-vts/tenants/tenant{Ten1}/topologies/topology{Z1}/routers/router{94397469-07fa-4f7c-933c-2a588cd69a50}",
          "template-target-type": "router-target",

                    ]
                },
                "vni": "4098"
            },
            "static-routes": [
                ]
        }
    }
}

```

Field Name	Possible Value	Mandatory
device name	Name of the device to which template needs to be detached	Y
L3 template name	Template name which needs to be detached	Y
VTC IP	IP address of VTC	Y
Tenant Name	Name of tenant	Y
Router Name	Name of Router	Y
Provider router value	Get from CDB Provider Router value - false / true	Y
VRF NAME	Format {Tenant Name - Router Name } or {Tenant Name - VNI ID } If tenant name is longer than 10 characters take the first 10> Get from CDB *	Y
VNI ID	VTS ALLOCATED VNI ID *	Y

## 4.20 DRY RUN Device Template attach

### 4.20.1 Attach API

PUT	/VTS/api/sites/{ SITE ID }/templates/attachDeviceTemplate/dry-run	Attach a Dry Run Device Template
-----	---	----------------------------------

#### Sample Payload:

```
{
  "resource": {
    "templateRequests": {
      "template-device-group": {
        "devices": {
          "device": [
            {
              "device_name": "tb24-tor1"
            }
          ]
        },
        "template-target-map": {
          "template_target_type": "device-target",
          "template_type": "device",
          "template_name": "DEvTemplate2",
          "template_target_id": "na"
        }
      }
    }
  }
}
```

Field Name	Possible Value	Mandatory
device name	Name of the device to which template needs to be attached	Y
device template name	Template name which needs to be attached	Y

### 4.20.2 Detach API

PUT	/VTS/api/sites/{ SITE ID }/templates/detachDeviceTemplate/dry-run	Detach a Dry Run Device Template
-----	---	----------------------------------

#### Sample Payload:

```
{
  "resource": {
    "templateRequests": {

```

```
"template-device-group": {
    "devices": {
        "device": [
            {
                "device_name": "tb24-tor1"
            }
        ]
    }
},
"template-target-map": {
    "template_target_type": "device-target",
    "template_type": "device",
    "template_name": "DEvTemplate2",
    "template_target_id": "na"
}
}
```

Field Name	Possible Value	Mandatory
device name	Name of the device to which template needs to be detached	Y
device template name	Template name which needs to be detached	Y

## 4.21 Route Template API

#### 4.21.1 Create Route Template

POS T	/vts- service/sites/site/<site_id>/te mplates	Create a new configuration template in VTS
----------	---	--

## Sample Payload:

```
{  
  "template": [  
    {  
      "name": "Sample Template",  
      "description": "A sample router template",  
      "type": "route",  
      "created-on": "2016-01-12T09:05:00",  
      "modified-on": "2016-01-12T09:30:00",  
      "route-template": {  
        "rt-seed": "70000",  
        "vrf-name": "Sample VRF name",  
        "next-hop": "192.168.1.1",  
        "metric": 10,  
        "tag": 100,  
        "label": 1000  
      }  
    }  
  ]  
}
```

```
"static-routes":{  
    "static-route": [  
        {  
            "destination": "1.1.1.0/24",  
            "next-hop": "2.2.2.0/24"  
        },  
        {  
            "destination": "3.3.3.0/24",  
            "next-hop": "4.4.4.4/32"  
        }  
    ]  
},  
"import-route-targets":{  
    "import-route-target": [  
        {  
            "stitching": "",  
            "route-target": "100:1000",  
            "route-target-type": "route-target-internal"  
        },  
        {  
            "route-target": "192.168.1.2:3001",  
            "route-target-type": "route-target-external"  
        }  
    ]  
},  
"export-route-targets":{  
    "export-route-target": [  
        {  
            "route-target": "172.27.184.56:12345",  
            "route-target-type": "route-target-internal"  
        },  
        {  
            "stitching": "",  
            "route-target": "123:60000",  
            "route-target-type": "route-target-external"  
        }  
    ]  
}
```

```

    ]
}

```

**Fields:**

Field Name	Possible Value	Mandatory
name	A string with a maximum of 128 characters	Y
description	A string with a maximum of 128 characters	N
Type	In this release, there is only one template type: route	Y
created-on	Date-time information in the format CCYY-MM-DDTHH:MM:SS	N (This will be system generated)
modified-on	Date-time information in the format CCYY-MM-DDTHH:MM:SS	N (This will be system generated)
vrf-name	A string with a maximum of 128 characters	N
rt-seed	An integer value with a range of 1-16777215	N
destination	An IPv4 address with prefix length	Y (if a new static-route element is to be added)
next-hop	An IPv4 address (Note: the prefix length information is optional in this case)	Y (if a new static-route element is to be added)
stitching	Can be either present or not present	N
route-target	Can be of one of the following 4 formats: 1. ASN2:NN4 2. ASN4:NN2 3. IPv4:NN2  where: NN2 and ASN2 has a range of 1-65535 NN4 and ASN4 has a range of 1-4294967295 IPv4 is an IPv4 address in the dotted decimal format	Y (if a new import-route-target/export-route-target element is to be added)
route-target-type	Can be of one of the following types: route-target-internal, route-target-external, route-target-both	Y (if a new import-route-target/export-route-target element is to be added)

#### 4.21.2 Updating a Template

\*Note: In this case, only the fields specified in the JSON body will be updated. All the existing

PATCH	/vts-service/sites/site/<site_id>/templates/template/<template_name>	Update a template
-------	--	-------------------

fields will remain the same.

##### Sample Payload:

```
{
  "template": [
    {
      "router-template": {
        "rt-seed": "8000",
        "static-routes": {
          "static-route": [
            {
              "destination": "10.10.10.0/24",
              "next-hop": "20.20.20.0/24"
            }
          ]
        },
        "import-route-targets": {
          "import-route-target": [
            {
              "stitching": "",
              "route-target": "8888:99",
              "route-target-type": "route-target-internal"
            }
          ]
        }
      }
    ]
  }
}
```

#### 4.21.3 Get List of Templates

GET	/vts-service/sites/site/<site_id>/templates	Retrieve list of templates
-----	---	----------------------------

**Sample Payload:**

```
{
  "cisco-vts-templates:templates":{
    "template":[
      {
        "name":"SR_RT_Template_1"
      },
      {
        "name":"SR_Template_1"
      },
      {
        "name":"Sample Template"
      },
      {
        "name":"Temp_3"
      },
      {
        "name":"Temp_4"
      }
    ]
  }
}
```

**4.21.4 Get a template using name**

GE T	/vts-service/sites/site/<site_id>/templates/template/{template_name}>	Gets details about a particular template
---------	---	--

**Sample Payload:**

```
{
  "cisco-vts-templates:template":{

    "name":"TemplateA",
    "description":"TempA",
    "type":"cisco-vts-templates:route",
    "created-on":"2016-02-19T23:30:12.128+00:00",
    "modified-on":"2016-02-19T23:30:12.129+00:00",
    "route-template":{

      "static-routes":{

        "static-route":[
          {
            "destination":"1.1.1.0/24",
            "next-hop":"2.2.2.0/24"
          }
        ]
      },
      "import-route-targets":{

        "import-route-target":[

```

```
{
  "route-target": "2.2.2.0:24"
}
],
},
"rt-seed": 12345
},
}
```

#### 4.21.5 Delete all templates

DELETE	/vts-service/sites/site/<site_id>/templates	Deletes all templates. Note: Template can be deleted if it is not attached to router.
--------	---	--

#### 4.21.6 Delete a template identified by name

DELETE	/vts-service/sites/site/<site_id>/templates/template/{template-name}	Deletes a template identified by name. Note: Template can be deleted if it is not attached to router.
--------	--	--

#### 4.21.7 Get a list of all existing route template associations

GET	/vts-service/sites/site/<site_id>/cisco-vts/template-target-maps	Gets a list of all the templates that are currently associated with a router
-----	--	--

#### 4.21.8 Attach Route Template to Router

Refer to section 4.19.11 (“Attach L3 service extension template to a router”).

#### 4.21.9 Get Template Type

GET	/vts-service/sites/site/<site_id>/templates/template/{template-name}/type	For a given template, list the type
-----	---	-------------------------------------

#### Sample Payload:

```
{
  "type": "route"
}
```

#### 4.21.10 Get List of Import Route Targets

GET	/vts-service/sites/site/<site_id>/templates/template/{template-name}/route-template/import-route-targets/import-route-target	For a given template, get list of import route targets
-----	--	--

**Sample Payload:**

```
{
  "import-route-target": [
    {
      "route-target": "65001:23",
      "route-target-type": "route-target-internal"
    }
  ]
}
```

#### 4.21.11 Get List of Export Route Targets

GET	/vts-service/sites/site/<site_id>/templates/template/{template-name}/route-template/export-route-targets/export-route-target	For a given template, get list of export route targets
-----	--	--

**Sample Payload:**

```
{
  "export-route-target": [
    {
      "route-target": "65004:22",
      "route-target-type": "route-target-internal"
    }
  ]
}
```

#### 4.21.12 Set Import Route Target to Route Template

PUT	/vts-service/sites/site/<site_id>/templates/template/{template-name}/route-template/import-route-targets/import-route-target/{route target}	For a given template, add a import route target
-----	---	---

**Sample Payload:**

```
{
  "import-route-target": [
    {
      "route-target": "65004:23",
      "route-target-type": "cisco-vts-templates:route-target-external"
    }
  ]
}
```

#### 4.21.13 Set Export Route Target to Route Template

PUT	/vts-service/sites/site/<site_id>/templates/template/{template-name}/route-template/export-route-targets/export-route-target/65004:23	For a given template, add an export route target
-----	---	--

**Sample Payload:**

```
{
  "export-route-target": [
    {
      "route-target": "65004:23",
      "route-target-type": "cisco-vts-templates:route-target-external"
    }
  ]
}
```

#### 4.21.14 Set Route Target to Internal Device

PUT	/vts-service/sites/site/<site_id>/templates/template/{template-name}/route-template/import-route-targets/import-route-target/{route target}	For a given template, add a route target to a ToR
-----	---	---

**Sample Payload:**

```
{
  "import-route-target": [
    {
      "route-target": "65004:23",
      "route-target-type": "cisco-vts-templates:route-target-internal"
    }
  ]
}
```

#### 4.21.15 Set Route Target to External Device

PUT	/vts-service/sites/site/<site_id>/templates/template/{template-name}/route-template/import-route-targets/import-route-target/{route target}	For a given template, add a route target to a DCI
-----	---	---

**Sample Payload:**

```
{
  "import-route-target": [
    {
      "route-target": "65004:23",
      "route-target-type": "cisco-vts-templates:route-target-external"
    }
  ]
}
```

```

        ]
    }

```

#### 4.21.16 Set Route Target to Both Internal and External Device

PUT	/vts-service/sites/site/<site_id>/templates/template/{template-name}/route-template/import-route-targets/import-route-target/{route target}	For a given template, add a route target to both a ToR and DCI
-----	---	--

**Sample Payload:**

```

{
  "import-route-target": [
    {
      "route-target": "65004:23",
      "route-target-type": "cisco-vts-templates:route-target-both"
    }
  ]
}

```

#### 4.21.17 Get List of Static Routes in Route Template

GET	/vts-service/sites/site/<site_id>/templates/template/{template-name}/route-template/static-routes	For a given template, get list of export route targets
-----	---	--

**Sample Payload:**

```

{
  "cisco-vts-templates:static-routes": {
    "static-route": [
      {
        "destination": "1.1.1.0/24",
        "next-hop": "2.2.2.0/24"
      },
      {
        "destination": "10.10.10.0/24",
        "next-hop": "20.20.20.0/24"
      }
    ]
  }
}

```

#### 4.21.18 Set a static route to a route template

PATC H	/vts-service/sites/site/<site_id>/templates/template/{template-name}/route-template/static-routes/static-route/	For a given template, add a static route
--------	---	--

**Sample Payload:**

```
{
  "static-route": [
    {
      "destination": "8.8.8.8/32",
      "next-hop": "4.4.4.4"
    }
  ]
}
```

**4.21.19 Delete a specific static route from Route Template**

DELETE	/vts-service/sites/site/<site_id>/templates/template/{template-name}/route-template/static-routes/static-route/"<destination_to_be_deleted>,<next_hop_to_be_deleted>"	Delete a specific static route in an existing template
--------	---	--

**4.21.20 Delete a specific import route target from route template**

DELETE	/vts-service/sites/site/<site_id>/templates/template/{template-name}/route-template/import-route-targets/import-route-target/"<route_target_to_be_deleted>"	Delete a specific import route target in an existing template
--------	---	---

**4.21.21 Delete a specific export route target from route template**

	/vts-service/sites/site/<site_id>/templates/template/{template-name}/route-template/export-route-targets/export-route-target/"<route_target_to_be_deleted>"	
DELETE		Delete a specific export route target in an existing template

## 4.22 Resource Pools

### 4.22.1 Vni Pool Creation (for the site with VxLAN Data Plane only)

PUT	/vts-service/sites/site/<site_id>/resource-pools/vni-pool/vnipooll	Create the global VNI Pool for VxLAN Data Plane only. Pool name must be "vnipooll"
-----	--	--

#### Sample Payload:

```
{
  "vni-pool": {
    "name": "vnipooll",
    "ranges": [
      {
        "range": {
          "id": "78d07cfec-b944-49a4-a598-3bcf0b843625",
          "start": "6001",
          "end": "7000"
        }
      }
    ]
  }
}
```

### 4.22.2 Evi Pool Creation (for the site with MPLS Data Plane only)

PUT	/vts-service/sites/site/<site_id>/resource-pools/evi-pool/srevipool	Create the global EVI Pool for MPLS Data Plane only. Pool name must be "srevipool"
-----	---	--

#### Sample Payload:

```
{}
```

```

"evi-pool": {
  "name":"srevipool",
  "ranges": {
    "range": {
      "id":"7b7be9e4-ad0a-4e47-8ff2-78b30d135b87",
      "start":"6001",
      "end":"7000"
    }
  }
}

```

#### 4.22.3 Vlan Pool Creation

PUT	/vts-service/sites/site/<site_id>/resource-pools/vlan-pool/<device name>	Create a vlan pool for a given device
-----	--	---------------------------------------

##### Sample Payload:

```

{
  "vlan-pool": {
    "name":"n9k",
    "ranges": {
      "range": {
        "id":"78d07cfef-b944-49a4-a598-3bcf0b843625",
        "start":"1001",
        "end":"2000"
      }
    }
  }
}

```

PUT	/vts-service/sites/site/<site_id>/resource-pools/vlan-pool/default	Create the global provider vlan pool(ranges can not overlap with any device or device-interface pool range)
-----	--	---

##### Sample Payload:

```

{
  "vlan-pool": {
    "name":"default",
    "ranges": {
      "range": {
        "id":"98d07cfef-b944-49a4-a598-3bcf0b843625",
        "start":"3001",
        "end":"3500"
      }
    }
  }
}

```

#### 4.22.4 Interface Dot1Q Pool Creation

PUT	/vts-service/sites/site/<site_id>/resource-pools/device-interface-pool/<device name>	Create an Interface Dot1Q pool for a given device (Only Nexus 7000 devices)
-----	--	---

##### Sample Payload:

```
{
  "device-interface-pool": {
    "name": "n7k",
    "ranges": {
      "range": {
        "id": "78d07cfef-b944-49a4-a598-3bcf0b843625",
        "start": "1001",
        "end": "2000"
      }
    }
  }
}
```

#### 4.22.5 Multicast Pool Creation

PUT	/vts-service/sites/site/<site_id>/resource-pools/vni-pool/multicastpool	Create the global multicast pool. Pool name must be “multicastpool”
-----	---	---

##### Sample Payload:

```
{
  "multicast-pool": {
    "name": "multicastpool",
    "ranges": {
      "range": {
        "id": "78d07cfef-b944-49a4-a598-3bcf0b843625",
        "start": "239.0.0.0",
        "end": "239.0.0.255"
      }
    }
  }
}
```

#### 4.22.6 Create a Restricted Range in VNI Pool (for the site with VxLAN Data Plane)

PUT	/vts-service/sites/site/<site_id>/resource-pools/vni-pool/vnipool	Create a range in a vni pool to be restricted
-----	---	---

**Sample Payload:**

```
{
  "vni-pool": {
    "name": "vnipool",
    "ranges": {
      "range": {
        "id": "78d07cfef-b944-49a4-a598-3bcf0b843625",
        "start": "6001",
        "end": "7000"
        "restricted": ""
      }
    }
  }
}
```

**4.22.7 Create a Restricted Range in EVI Pool (for the site with MPLS Data Plane)**

PUT	/vts-service/sites/site/<site_id>/resource-pools/vni-pool/vnipool	Create a range in a evi pool to be restricted
-----	---	---

**Sample Payload:**

```
{
  "evi-pool": {
    "name": "srevipool",
    "ranges": {
      "range": {
        "id": "78d07cfef-b944-49a4-a598-3bcf0b843625",
        "start": "6001",
        "end": "7000"
        "restricted": ""
      }
    }
  }
}
```

**4.22.8 Unrestricting a Range (for the site with VxLAN Data Plane)**

DELETE	/vts-service/sites/site/<site_id>/resource-pools/vni-	Removing the restrict attribute of a range in vni pool
--------	---	--

	pool/vnippool/ranges/range/<range id>/restricted	
--	--	--

#### 4.22.9 Unrestricting a Range (for the site with MPLS Data Plane)

DELETE	/vts-service/sites/site/<site_id>/resource-pools/evi-pool/srevipool/ranges/range/<range id>/restricted	Removing the restrict attribute of a range in evi pool
--------	--	--

#### 4.22.10 Restricting static allocations to range only

PUT	/cisco-vts/global-settings/resource-allocator-config/allocate-outside-range	Force static allocations to come only from ranges
-----	---	---

**Sample Payload:**  
**{ "allocate-outside-range":"false"}**

## 4.23 Profiles

Allows to manipulate profiles in VTS. Profiles is essentially a logical group of common attributes that can be attached to an existing VTS entities. For example, currently, “Stitching Profile” can be created and attached to DCI functional group in admin domain. This allows to provision some extra services on DCI devices, like L2 VNI.

### 4.23.1 Stitching profile

#### 4.23.1.1 Create/Update URI

PATCH	/vts-service/sites/site/<site_id>/profiles/profile/	Create Stitching profile
-------	---	--------------------------

#### 4.23.1.2 Sample Payload

```
{
  "profile": {
    "id": "44d738a2-d901-11e6-9c75-005056862217",
    "name": "automationStitchingProfile",
    "type": "stitching",
    "created-on": "2017-01-12T11:56:55",
    "control-protocol-type": "cisco-vts-stitching-profile:control-protocol-mp-bgp",
    "vts-mp-bgp-profile-id": "4460c0a0-d901-11e6-9c75-005056862217",
    "services": {
      "service": [
        {
          "service-type": "cisco-vts-stitching-profile:service-type-internet",
          "route-policy-profile-id": "44a09ebe-d901-11e6-9c75-005056862217"
        }
      ]
    },
    "remote-neighbours": {
      "remote-neighbour": [
        {
          "router-id": "60.60.60.1"
        }
      ]
    }
  }
}
```

#### 4.23.1.3 Payload Fields

Field	Data Type	Mandatory	Description
id	String	Y	Unique identifier
name	String	Y	Name of the profile

description	String	N	Details description if any
type	cisco-vts-profiles:profile-type	Y	This has to cisco-vts-profiles:stitching for stitching profile
remote-neighbours	List of neighbor ips	Y	At least 1 neighbor is needed
services	List	Y	List of services(intern/mpls l2vni)
service-type	cisco-vts-stitching-profile: core-network-service-type	Y	supported values are cisco-vts-stitching-profile:service-type-mpls-l2vpn and cisco-vts-stitching-profile:service-type-internet
control-protocol-typ	cisco-vts-stitching-profile: core-network-control-protocol	Y	Only supported value so far is cisco-vts-stitching-profile:control-protocol-mp-bgp
vts-mp-bgp-profile-id	Reference of BGP profile Id	Y	stitching

#### 4.23.2 BGP profile

##### 4.23.2.1 Create/Update URI

PATCH	/vts-service/sites/site/<site_id>/profiles/profile/	Create BGP profile
-------	---	--------------------

##### 4.23.2.2 Sample Payload

```
{
  "profile": {
    "name": "bgp-profile",
    "type": "cisco-vts-profiles:bgp",
    "id": "c144f5ef-2cce-4b09-b496-987ff820de9d",
    "bgp-as-number": 100,
    "address-families": [
      {
        "address-family": "l2vpn"
      }
    ]
  }
}
```

```

        ],
        "loopback-if-number":1
    }
}

```

#### 4.23.2.3 Payload Fields

Field	Data Type	Mandatory	Description
name	String	Y	Name of the profile
description	String	N	Details description if any
type	cisco-vts-profiles:profile-type	Y	This has to cisco-vts-profiles:bgp for bgp profile
bgp-as-number	String	Y	ASN number for core network
Address-families	List of families supported	Y	Only supported value so far l2vpn

#### 4.23.3 Route policy profile

##### 4.23.3.1 Create/Update URI

PATCH	/vts-service/sites/site/<site_id>/profiles/profile/	Create route policy profile
-------	---	-----------------------------

##### 4.23.3.2 Sample Payload

```

{
  "profile": {
    "name": "router-profile",
    "type": "cisco-vts-profiles:route-policy",
    "id": "48763f5e-3444-4809-a491-ddbcbf28963",
    "underlay-route-policy": {
      "dc-fabric-external-policy": {
        "route-advertisements": {
          ...
        },
        "route-filter": "route-policy-in"
      },
      "dc-fabric-internal-policy": {
        "route-filter": "route-policy-out"
      }
    }
  }
}

```

#### 4.23.3.3 Payload Fields

Field	Data Type	Mandatory	Description
name	String	Y	Name of the profile
description	String	N	Details description if any
type	cisco-vts-profiles:profile-type	Y	This has to cisco-vts-profiles:route-policy for route policy profile
dc-fabric-external-policy	String	Y	Name of policy to be applied on DCI devices.
dc-fabric-internal-policy	String	Y	Name of policy to be applied on Fabric side devices.

#### 4.23.4 Get any profile

GET	/vts-service/sites/site/<site_id>/profiles/profile/{id}	Get any profile
-----	---	-----------------

#### 4.23.5 Delete any profile

Delete	/vts-service/sites/site/<site_id>/profiles/profile/{id}	Get any profile
--------	---	-----------------

#### 4.24 Global Route Table (GRT) service profile ( Route Leak profile)

Global route leaking feature enables you to provide internet/external connectivity to the host inside the Data Center. This feature allows associating/dissociating of Global Route Leaking (also known as Global Routing Table [GRT]) Service to/from the Overlay Router. The following should be done in order to utilize the GRT service. Pre-requisite for GRT is to create a Stitching profile with cisco-vts-stitching-profile:service-type-internet (refer 4.20.1), BGP Profile (refer 4.20.2)

#### 4.24.1 Create/Update a GRT Profile URI

PATCH	/vts-service/sites/site/<site_id>/profiles/profile/	Create overlay route policy profile
-------	---	-------------------------------------

#### 4.24.2 Sample payload

```
{
  "profile": {
    "id" : "39ca68b7-c522-4d7e-89e4-3019fc526333",
    "name": "Tenant100Grt100",
    "type": "cisco-vts-profiles:route-policy-overlay",
    "overlay-route-policy": {
      "dc-fabric-external-policy": {
        "route-filter": "data-center-vrf-export-policy"
      },
      "dc-fabric-internal-policy": {
        "route-filter": "data-center-vrf-import-policy"
      }
    }
  }
}
```

Field	Data Type	Mandatory	Description
name	String	Y	Name of the profile
description	String	N	Details description if any
type	cisco-vts-profiles:profile-type	Y	This has to be cisco-vts-profiles:route-policy-overlay for GRT service profile
dc-fabric-external-policy	String	Y	Name of already created route-policy filter on DCI -- to be applied as fabric export policy
dc-fabric-internal-policy	String	Y	Name of already created route-policy filter on DCI, to be applied as Fabric import policy to the overlay router.

#### 4.24.3 GET VPN for Overlay Route Policy Profile

Fetch VPN id for overlay route-policy profile created in the step above.

GET	/vpns/vpn {id}	Get all VPN
-----	----------------	-------------

#### RESULT:

```
{
  "cisco-vts:vpn": {
    "id": "20584262-7568-4068-8b09-3c0b7b0106b4",
    "name": "Tenant100GrtVpn1",
    "type": "cisco-vts:vpn-service-type-internet",
    "service-domain": "cisco-vts:vpn-service-domain-dc-fabric-external",
    "internet": {
      "address-families": {
        "address-family": [
          {
            "family": "ipv4",
            "overlay-route-policy": "39ca68b7-c522-4d7e-89e4-3019fc526333"
          }
        ]
      }
    }
  }
}
```

#### 4.24.4 Associate VPN ID to Router

PATCH	tenants/tenant/Tenant100/topologies/topology/Tenant100/routers/router/	Associate VPN ID with Router
<pre>{   "cisco-vts:router": {     "id": "d640096b-1a42-40b6-88f5-7ca8050bb511",     "name": "T100RT1",     "router-gateway": "d8451c2d-5a56-4bcd-bbbd-cf78202017c4",     "status": "cisco-vts-identities:active",     "vts-allocated-vni": 10231,     "overlay-router-vpn-id": "20584262-7568-4068-8b09-3c0b7b0106b4"   } }</pre>		

Overlay-router-vpn-id	String	VPN id associate with overlay route policy profile is creation
-----------------------	--------	--

## 4.25 AAA

Allows to manipulate AAA server and accounting configuration in VTS.

### 4.25.1 Authentication and Authorization

#### 4.25.1.1 Global Timeout – Get and Update

*Global timeout is the connection timeout of VTC with a AAA server. The default is 15 secs.*

GET	<a href="/vts-service/external-authentication/timeout">/vts-service/external-authentication/timeout</a>	Get the Global Timeout
-----	---	------------------------

Sample Response

```
{
  "cisco-vts:timeout": 15
}
```

PATCH	<a href="/vts-service/external-authentication/timeout">/vts-service/external-authentication/timeout</a>	Set the Global Timeout
-------	---	------------------------

Sample Payload

```
{
  "cisco-vts:timeout": 20
}
```

#### 4.25.1.2 Enable and Disable External Auth

In order to use AAA, external auth needs to be enabled.

PATCH	<a href="/vts-service/external-authentication">/vts-service/external-authentication</a>	Enable External auth by setting the external-auth flag
-------	---	--

Sample Payload

```
{
  "external-authentication": {
    "external-auth-enabled-info": {
      "external-auth-enabled": [null]
    }
  }
}
```

DELETE	<a href="/vts-service/external-authentication/external-auth-enabled-info/external-auth-enabled">/vts-service/external-authentication/external-auth-enabled-info/external-auth-enabled</a>	Disable External auth by deleting the external-auth flag
--------	---	--

#### 4.25.1.3 Tacacs+ Server Configuration – Create, Update, Delete and Get

A Tacacs+ server can be configured in VTC by adding a Tacacs+ server configuration. This will enable VTC to communicate with Tacacs+ server for authentication, authorization and accounting.

PATCH	<a href="/vts-service/external-authentication/external-auth-modes/external-auth-mode">/vts-service/external-authentication/external-auth-modes/external-auth-mode</a>	Create an Tacacs External Auth configuration in VTC
-------	---	---

#### Sample Payload

```
{
  "external-auth-mode" : {
    "order": 0,
    "auth-type": "tacacs-external-auth-mode",
    "auth-mode-enabled": [null],
    "tacacs-server-credentials": {
      "tacacs-server-credential": [
        {
          "key": "tacacskey123",
          "port": "49",
          "ip-hostname": "172.20.100.205",
        }
      ]
    }
  }
}
```

```

        "id": "48763f5e-3444-4809-a491-dddbcbf28963"
    }
]
}
}
}

```

GET	<a href="#"><code>/vts-service/external-authentication/external-auth-modes/external-auth-mode/tacacs-external-auth-mode/tacacs-server-credentials/tacacs-server-credential/&lt;tacacs-server-uuid&gt;</code></a>	Get the details of the a tacacs server credential
-----	--	---

#### Sample Response

GET [`/vts-service/external-authentication/external-auth-modes/external-auth-mode/tacacs-external-auth-mode/tacacs-server-credentials/tacacs-server-credential/0ca6434c-408e-42cb-ac59-7acdca56d798`](#)

```

{
  "cisco-vts:tacacs-server-credential": {
    "id": "0ca6434c-408e-42cb-ac59-7acdca56d798",
    "ip-hostname": "172.20.100.200",
    "key": "cisco",
    "port": 49
  }
}

```

DELETE	<a href="#"><code>/vts-service/external-authentication/external-auth-modes/external-auth-mode/tacacs-external-auth-mode/tacacs-server-credentials/tacacs-server-credential/&lt;tacacs-server-uuid&gt;</code></a>	Delete a tacacs server configured using the uuid
--------	--	--

#### Sample Request

---

[DELETE /vts-service/external-authentication/external-auth-modes/external-auth-mode/tacacs-external-auth-mode/tacacs-server-credentials/tacacs-server-credential/0ca6434c-408e-42cb-ac59-7acdca56d798](#)

Note: If all the Tacacs+ server configurations are deleted, the external auth will not get disabled on its own. The external auth needs to be disabled explicitly (as in [4.24.1.2](#)).

## 4.25.2 Accounting / Logging to Tacacs+ Server

### 4.25.2.1 Update Logging Interval

The accounting logs are collected at periodic intervals and sent to Tacacs+. The default is set to 30 secs. The logging interval can be changed at any time using a rest call.

PUT	<a href="#"><u>/vts-service/external-authentication/external-auth-enabled-info/logging-interval</u></a>	Change the log collection interval
-----	---	------------------------------------

Sample Payload

```
{
  "cisco-vts:logging-interval": 30
}
```

### 4.25.2.2 Enable Accounting

For accounting logs to be sent to the external AAA server, the accounting needs to be enabled.

Please note: We support only 1 AAA server for accounting at a time, so if there is already one enabled, the rest consumer needs to disable it. And then enable the tacacs server

PATCH	<a href="#"><u>/vts-service/external-authentication/external-auth-modes/external-auth-mode/tacacs-external-auth-mode/tacacs-server-credentials/tacacs-server-credential/&lt;tacacs-server-uuid&gt;</u></a>	Enable accounting for a tacacs server
-------	--	---------------------------------------

### Sample Payload

[vts-service/external-authentication/external-auth-modes/external-auth-mode/tacacs-external-auth-mode/tacacs-server-credentials/tacacs-server-credential/0ca6434c-408e-42cb-ac59-7acdca56d79d](#)

```
{  
    "cisco-vts:tacacs-server-credential": {  
        "accounting": {  
            "accounting-enabled": [null]  
        }  
    }  
}
```

## 4.26 Device Objects

Device objects allow you to define parameterized device config (currently supports port-channel and ethernet config). This parameterized device config can later be associated with device by supplying values to the parameterized device config.

The authoring of device object with parameterized keypath/values (a.k.a device object definition) is done using the url

```
api/running/vts-service/sites/site/<site-id>/cisco-vts/device-objects
```

The creation of device object instance attached to a device by passing values to parameterized fields (a.k.a device object association) is done using url

```
api/running/vts-service/sites/site/<site-id>/cisco-vts/device-object-assocations/device-object-association/<device-object-uuid>
```

**NOTE:** Please refer to [Important Notes and Caveats](#) section on device objects while creating/using API

### 4.26.1 Create Ethernet object

POST	/api/running/vts-service/sites/site/<site-id>/cisco-vts/device-objects	Create Ethernet device object with key path param and static value
------	--	--

Sample payload – Ethernet Device object.

```
{
  "device-object": [
    {
      "id": "E725A958-F4EF-439A-9221-7D237FC3C43W",

            }
          ]
        }
      }
    }
  ]
}
```

#### Fields:

Field Name	Possible Value	Mandatory
Id	UUID string which acts like a key	Y
name	A non-empty string with a maximum of 128 characters	Y
description	A string with a maximum of 128 characters	N
Type	The type of the device-object. cisco-vts:port-channel or cisco-vts:ethernet	Y
created-on	Date-time information in the format CCYY-MM-DDTHH:MM:SS	N (This will be system generated)
modified-on	Date-time information in the format CCYY-MM-DDTHH:MM:SS	N (This will be system generated)
platform	cisco-vts-identities:N9K, cisco-vts-identities:N7K	Indicates which device platform config this device object contains
schema-revision-date	String in YYYY-MM-DD format indicating the platform NED last revision date	Y (e.g. if cisco-vts-identities:N9K is selected as the platform – this would be the tailf-ned-cisco-nx.yang last revision date )
schema-namespace	Namespace for the device object schema based on platform selection	Y (e.g. if cisco-vts-identities:N9K is selected as the platform – this would be the tailf-ned-cisco-nx.yang namespace " <a href="http://tail-f.com/ned/cisco-nx">http://tail-f.com/ned/cisco-nx</a> "
keypath	A unique path to the device config. This path can be parameterized as needed or can contain static values.	Y (at least one should be specified)
value	The config value (in valid JSON format) for the corresponding key path. The fields in the value can be parameterized as needed or can contain static values	Y (at least one should be specified to corresponding at least one keypath)
param-name	string – starting with "\$"	<p>N(Optional:)</p> <p>The entire <b>params</b> block in payload is optional. If not provided -- VTC will automatically generate it based on \$&lt;params&gt; in keypath/values.</p> <p>The parametrized name if provided should be part of keypath or value else device object cannot be saved.</p>

param-type	string	N(Optional)  Capturing the type of the corresponding param-name if supplied. type can be int, string, list etc.  This needs to be supplied if param-name field is being supplied. If not, VTC will automatically generate the same.
------------	--------	---

#### 4.26.2 Create port-channel device object

          "properties": "{\"type\":\"string\"}"
        },
        {
          "name": "$switchport",
          "properties": "{\"type\":\"boolean\"}"
        }
      ]
    }
  }
}
```

#### 4.26.6 Get List of device-objects

Note: This API will get a list of all device-objects in the system, including both port-channel and ethernet-channel

GET	/api/running/vts-service/sites/site/<site-id>/cisco-vts/device-objects?deep&operations=false	Gets list of device objects giving all details of each device-object  Note: If you just need uid of the device object remove ?deep from the URL
-----	--	---

#### 4.26.7 Get a particular device-object's definition params

GET	<a href="#">/api/running/vts-service/sites/site/&lt;site-id&gt;/cisco-vts/device-objects/device-object/&lt;device-objectUUID&gt;/definition/params?deep</a>	Gets a list of \$PARAMS name in device-object keypath/values that need to be supplied with values when associating device object with a device.
-----	---	---

```
{  
  "cisco-vts:params": {  
    "param": [  
      {  
        "name": "$DESC",  
        "properties": "{\"type\": \"string\"}"  
      },  
      {  
        "name": "$ETHERNET-NAME",  
        "properties": "{\"type\": \"string\"}"  
      },  
      {  
        "name": "$MTU",  
        "properties": {}  
      }  
    ]  
  }  
}
```

```

    "properties": "{\"type\": \"string\"}"
},
{
  "name": "$NATIVE",
  "properties": "{\"type\": \"boolean\"}"
},
{
  "name": "$SHUT",
  "properties": "{\"type\": \"string\"}"
},
{
  "name": "$SWITCH_MODE",
  "properties": "{\"type\": \"boolean\"}"
},
{
  "name": "$VLAN_IDS-ID",
  "properties": "{\"type\": \"list\"}"
}
]
}
}

```

#### 4.26.8 Associating device-object to a device by creating an instance

POST	<a href="#">/api/running/vts-service/sites/site/&lt;site-id&gt;/cisco-vts/device-object-associations/device-object-association/&lt;device-object-UUID&gt;/devices/device/&lt;device-name&gt;/instances</a>	Associates a device object definition to device by providing values to the \$PARAM names (\$PARAM name in device object can be got using the above API).
------	--	--

```

{
  "instance": [
    {
      "params": {
        "param": [
          {
            "name": "$ETHERNET-NAME",
            "properties": "{\"value\": \"1/3\"}"
          },
          {
            "name": "$desc",
            "properties": "{\"value\": \"desc test 1/3\"}"
          },
          {
            "name": "$VLAN_IDS-ID",
            "properties": "{\"value\": [200,230]}"
          }
        ]
      },
      "name": "DO_Instance-TOR3",
      "type": "cisco-vts:ethernet"
    }
  ]
}

```

#### 4.26.9 Updating a particular device-object association instance on device

PUT	<a href="#">/api/running/vts-service/sites/site/&lt;site-id&gt;/cisco-</a>	Updates a device object instance on device with
-----	--	---

	vts/device-object-associations/device-object-association/<device-object-UUID>/devices/device/<device-name>/instances/instance/<instance-name>,<instance-type>	supplying of new \$PARAM names values or update of existing \$PARAM values. <instance-type> is either Ethernet or Port-channel
--	---	---

```
{
  "instance": [
    {
      "params": {
        "param": [
          {
            "name": "$ETHERNET-NAME",
            "properties": "{\"value\": \"1/3\"}"
          },
          {
            "name": "$desc",
            "properties": "{\"value\": \"desc test 1/3\"}"
          },
          {
            "name": "$VLAN_IDS-ID",
            "properties": "{\"value\": [200,230,400]}"
          }
        ]
      },
      "name": "DO_Instance-TOR3",
      "type": "cisco-vts:ethernet"
    }
  ]
}
```

#### 4.26.10 Updating of multiple instances of device object associated with device

PUT	/api/running/vts-service/sites/site/<site-id>/cisco-vts/device-object-associations/device-object-association/<device-object-UUID>/devices/device/<device-name>/instances/	Updates a device object that has multiple instances on device by supplying of new \$PARAM names values or update of existing \$PARAM values.
-----	---	--

```
{
  "instances": {
    "instance": [
      {
        "params": {
          "param": [
            {
              "name": "$ETHERNET-NAME",
              "properties": "{\"value\": \"1/3\"}"
            },
            {
              "name": "$desc",
              "properties": "{\"value\": \"desc test 1/3\"}"
            },
            {
              "name": "$VLAN_IDS-ID",
              "properties": "{\"value\": [200,230]}"
            }
          ]
        }
      }
    ]
  }
}
```

```

        ],
      },
      "name": "DO_Instance1-TOR3",
      "type": "cisco-vts:ethernet"
    },
    {
      "params": {
        "param": [
          {
            "name": "$ETHERNET-NAME",
            "properties": "{\"value\": \"1/9\"}"
          },
          {
            "name": "$desc",
            "properties": "{\"value\": \"desc test 1/9\"}"
          },
          {
            "name": "$VLAN_IDS-ID",
            "properties": "{\"value\": [200,230]}"
          }
        ]
      },
      "name": "DO_Instance2-TOR3",
      "type": "cisco-vts:ethernet"
    }
  ]
}

```

Addding a new instance as part of the update (as show highlighted)

```

{
  "instances": {
    "instance": [
      {
        "params": {
          "param": [
            {

}

```

#### 4.26.11 Get of device-object device association instance(s)

		Gets details of a device object instance associated to a particular device. It shows the \$PARAM and values given to those params
GET	/api/running/vts-service/sites/site/<site-id>/cisco-vts/device-object-associations/device-object-association/<device-object-UUID>/devices/device/<device-name>/instances/instance/"<instance-name>,<instance-type>"?deep&operations=false	To get all instances of device object association to device use  /api/running/vts-service/sites/site/<site-id>/cisco-vts/device-object-associations/device-object-association/<device-object-UUID>/devices/device/<device-name>/instances

```
{
    "cisco-vts:instance": {
        "name": "Ethernet_DO2_1/23_b1",
        "type": "cisco-vts:ethernet",
        "modified-on": "2018-08-24T19:10:03.156+00:00",
        "params": {
            "param": [
                {
                    "name": "$ADDRESS_PRIMARY-LIST-ADDRESS",

```

```

"properties": "{\"value\": [\"100.100.100.10\"]}"
},
{
  "name": "$ETHERNET-NAME",
  "properties": "{\"value\": \"1/23\"}"
},
{
  "name": "$ETHERNET_VRRPV3-ADDRESS-FAMILY",
  "properties": "{\"value\": [\"ipv4\"]}"
},
{
  "name": "$ETHERNET_VRRPV3-VR",
  "properties": "{\"value\": [\"1\"]}"
},
{
  "name": "$SW_Enable",
  "properties": "{\"value\": \"false\"}"
},
{
  "name": "$VLAN_IDS-ID",
  "properties": "{\"value\": [2400,2500]}"
},
{
  "name": "$desc",
  "properties": "{\"value\": \"desc test 1/23\"}"
}
]
}
}
}

```

#### 4.26.12 Get of <do-edit-applied> flag of a device to check if device-object edit got applied or not

GET	/api/running/vts-service/sites/site/<site-id>/cisco-vts/device-object-associations/device-object-association/<device-object-UUID>/devices/device/<device-name>?deep&operations=false	<p>When we have device-object associated with devices by creating instance of the device object, and then when device-object definition is updated with modification to keypath/values “do-edit-applied” flag is set to false under each device.</p> <p>api/running/vts-service/sites/site/&lt;site-id&gt;/cisco-vts/device-object-associations/device-object-association/&lt;device-object-UUID&gt;/devices/device/&lt;device-name&gt;. This flag is per device associated with device object.</p> <p>When any instance of the device-object gets updated, the “do-edit-applied” flag is reset to true (default value) indicating the DO edit</p>
-----	--	--

---

		changes are applied on that device
--	--	------------------------------------

```

#### 4.26.13            [DELETE of a particular device object instance associated with a device](#)

<b>DELETE</b>	/api/running/vts-service/sites/site/<site-id>/cisco-vts/device-object-associations/device-object-association/<device-object-UUID>/devices/device/<device-	Deletes a particular device object instance associate with device
---------------	---	---

	<p><code>&lt;name&gt;/instances/instance/&lt;instance-name&gt;,&lt;instance-type&gt;</code></p>	<p>identified by <code>&lt;instance-name&gt;,&lt;instance-type&gt;</code></p> <p><code>&lt;instance-type&gt;</code> is Ethernet or Port-Channel</p>
--	---	---

#### 4.26.14     DELETE all instances of device object instances

<b>DELETE</b>	<code>/api/running/vts-service/sites/site/&lt;site-id&gt;/cisco-vts/device-object-associations/device-object-association/&lt;device-object-UUID&gt;/devices/device/&lt;device-name&gt;/instances</code>	Deletes all device object instances associated with device
---------------	---	--

#### 4.26.15     DELETE of a particular device object instance associated with a device

<b>DELETE</b>	<code>/api/running/vts-service/sites/site/&lt;site-id&gt;/cisco-vts/device-object-associations/device-object-association/&lt;device-object-UUID&gt;/devices/device/&lt;device-name&gt;/instances/instance/&lt;instance-name&gt;,&lt;instance-type&gt;</code>	<p>Deletes a particular device object instance associate with device identified by <code>&lt;instance-name&gt;,&lt;instance-type&gt;</code></p> <p><code>&lt;instance-type&gt;</code> is Ethernet or Port-Channel</p>
---------------	--	---

#### 4.26.16     DELETE all instances of device object instances

<b>DELETE</b>	<code>/api/running/vts-service/sites/site/&lt;site-id&gt;/cisco-vts/device-object-associations/device-object-association/&lt;device-object-UUID&gt;/devices/device/&lt;device-name&gt;/instances</code>	Deletes all device object instances associated with device
---------------	---	--

#### 4.26.17     IMPORTANT NOTES AND CAVEATS RELATED TO DEVICE OBJECTS

Item	Description
1. Instance Name convention for API created DO to work without issues in VTS UI	<p>A. The Device Object Instance name should strictly match the following convention  <code>&lt;device object name&gt;_&lt;port_channel&gt;_&lt;interface_number&gt;_&lt;device_name&gt;</code> for port-channel device object  e.g.  DO name : DO1  Port-channel interface number: 100  Device name: ToR1  Then instance name should be DO1_100_ToR1</p> <p>B. The Device Object instance name should strictly match the following convention  <code>&lt;device_object_name&gt;_&lt;ethernet_interface&gt;_&lt;device_name&gt;</code> for Ethernet device object  e.g.  DO name: DO1  Ethernet interface: 1/1  Device Name : ToR2  Then instance name should be DO1_1/1_ToR2</p>
2. Configuration	Using “switch port trunk allowed vlan none” config as part of device template or device object will wipe off the vlan id configs at later points (redeploy, reconcile and upgrade of services) on device with port attach on same interface. Hence, configure and use it with expected impact in all functional flows. E.g: Port-attach and then attaching device template will wipe off the vlan id of port attach config.
3. API	When using API ensure that the config keypath and config keypath value case matches. Also, If a \$PARAM e.g \$ETHERNET-NAME is in keypath/value then while giving instance value ensure that the same case \$ETHERNET-NAME is used. Instances have been seen that the config is ignored if the case doesn't match between keypath and config keypath value.
4. Sample Device objects	We have 4 Sample device objects (Port-channel DO, Ethernet DO each for N9k and N7k platform types respectively) for read-only from UI. If user edits these Device objects from Manage/Authoring and Associate page, valid error will be displayed on UI "Sample Device Objects cannot be updated. Copy Sample Device Object for further usage"
5. Configuration	N7K configurations under "isis" container config should be configured as day0 on device. NED needs to provide the sub-level configs support under "isis" container config. RT#34389
6. Sub-config under a config with composite-keys	If a normal config (non-composite keys config) contains two \$PARAMS of list type in keypath, combination of them m * n for the values, given to list is used to create that many substituted config keypaths.  But in case of config with composite-key, that is having a list subconfig, combination cannot be done for the same and should have 1-1 mapping.

	<p>For example: Here is the config for “VR and Address family” and addresses within that composite key.</p> <pre>"config/nx:interface/Ethernet{\$ETHERNET-NAME}/vrrpv3{\$ETHERNET_VRRPV3-VR "  "{\$ETHERNET_VRRPV3-ADDRESS-FAMILY}"}</pre> <p>it has sub config of primary addresses (which are of list type)</p> <pre>"config/nx:interface/Ethernet{\$ETHERNET-NAME}/vrrpv3{\$ETHERNET_VRRPV3-VR  {\$ETHERNET_VRRPV3-ADDRESS-FAMILY}/address/primary-list{\$ADDRESS_PRIMARY-LIST-ADDRESS}}</pre> <p>If user provides values for \$ETHERNET_VRRPV3-VR as 100, 200 and for \$ETHERNET_VRRPV3-ADDRESS-FAMILY as ipv4, ipv6 and for ADDRESS_PRIMARY-LIST-ADDRESS as 10.10.10.10, 2001:db8:abcd:0012::0/64</p> <p>In this case, cannot do a combination of primary addresses to the composite keys i.e. composite key {100, ipv4} having both the addresses 10.10.10.10 and 2001:db8:abcd:0012::0/64 -- This will not work as address family is ipv4..</p> <p>Hence 1-1 mapping of the list values under composite-key needs to be done so it should look like</p> <pre>{100,ip4} having just 10.10.10.10 {200,ipv6} having just 2001:db8:abcd:0012::0/64</pre> <p>Currently this creates a limitation that the user cannot supply multiple primary addresses to address family</p>
7. Configuration	<p>Device specific behavior: Wherein cleanup is not working properly for vlan ids for Ethernet interface configs with channel-group id referenced in it.</p> <p>The “switchport trunk allowed vlan &lt;id&gt;” was pushed to both port-channel and Ethernet interface referencing it. But, while detaching the config “switchport trunk allowed vlan &lt;id&gt;” was not removed from Ethernet interface. We need to enable the “switchport” config in device object definition under port-channel container for the cleanup to work properly on device. Note: Device was not rejecting the config push “switchport trunk allowed vlan &lt;id&gt;” without enable “switchport” config.</p>
8. Port-channel Ethernet supported config	<p>Under Port-channel device object, the only ethernet config allowed and supported from VTS UI is</p> <pre>keypath-value "config/nx:interface/Ethernet{\$ETHERNET-NAME}" {     value "{\$Ethernet": {"name": "\$ETHERNET-NAME",     "shutdown": "\$SHUT1"} }";</pre>

```

        }
        keypath-value "config/nx:interface/Ethernet{$ETHERNET-
NAME}/channel-group" {
            value "{\"channel-group\": {\"id\": \"$PORT-CHANNEL-NAME\"}}";
        }
        keypath-value "config/nx:interface/Ethernet{$ETHERNET-
NAME}/enable" {
            value "{\"enable\": {\"switchport\": \"true\"}}";
        }
    }
}

```

## 4.27 Full Text Search of Device Objects

Full text search enables the user to search for any details of device objects importantly the config contained in the device object.

### 4.27.1 Get search results

Fetch device objects matching the search term with GET rest call

[https://localhost:8443/VTS/rs/sites/004dbc7e-c68b-4332-9075-ec823b03615a/search/deviceobject?searchString=\\*&type=&instType=&category=deviceObjectDefinition/deviceObjectInstance](https://localhost:8443/VTS/rs/sites/004dbc7e-c68b-4332-9075-ec823b03615a/search/deviceobject?searchString=*&type=&instType=&category=deviceObjectDefinition/deviceObjectInstance)

Below are the query params passed

**searchString:** It is the term user wants to search. Search string can be customized further to get more relevant results. Below are the supported options for searchString text:

**Text:** Normal text-based search

**Example:** ethernet - to search for all ethernet matches

“ “ : Double quotes to search complete phrases and IP addresses

**Example:** "service extension", "ETHERNET\_DEVICE\_OBJECT\_N9K", "10.1.1.0/26", "2001:0db8:85a3:0000:0000:8a2e:0370:7334", "mtu:1000"

\* : Wildcard search

**Example:** \* - to display all search results

swi\* - to search for any word that starts with ‘swi’

virt\*tch - to search for any word that starts with ‘virt’ and ends with ‘tch’

? : Single character wildcard search

**Example:** te?t - to match test, text etc.

**AND :** Search where both terms exist. AND must be in Uppercase.

**Example:** vrf AND bgp

**OR :** Search where either of the term exists. OR must be in Uppercase.

**Example:** vrf OR bgp

**NOT :** Search excludes terms that are mentioned after NOT. NOT must be in Uppercase.

**Example:** vrf NOT bgp, (vrf AND bgp) NOT ipv6

**type:** type corresponds to the device object definition type. Possible type values are deviceObjectPortChannel and deviceObjectEthernet.

**instType:** instType corresponds to the device object instance type. Possible instType values are deviceObjectPortChannelInst and deviceObjectEthernetInst.

**category:** Possible category values are deviceObjectDefinition and deviceObjectInstance.

User has to specify searchString query param and category query param default value ‘deviceObjectDefinition|deviceObjectInstance’ to get search results. type, instType are passed to further filter the results.

Note: query params are case insensitive.

Apart from the device object specific details, search on query term returns additional fields in the result and is explained below.

**highlightSnippets :** When you search for a term from extension device object configs ( aka Key-Path value), corresponding matched snippets are displayed under this section. Snippets are the fragment of the device object document.

**facets:** Based on the filters specified in the request, facets shows the count of device objects found for each filter category in the search result.

**facetAdjustment:** The facetAdjustment contains the adjustment values that is needed to be done to the result Facet counts per VTS application requirements.

#### 4.27.1.1 Sample request with term “ethernet” search

<https://localhost:8443/VTS/rs/sites/004dbc7e-c68b-4332-9075-ec823b03615a/search/deviceobject?searchString=ethernet&type=&instType=&category=deviceObjectDefinition|deviceObjectInstance>

  }
}
}

```

**Response Code: 200**

**Response Body:**

```
{
  "dryRunOutput": {
    "tb19-tor1%Atin_test_l2": {
      "status": "noDiff",
      "message": "No Difference",
      "checksum": "-498697704"
    }
  },
  "dryRunTimestamp": "2018-10-26 10:24:41"
}
```

## 4.29 Static Routes:

The following API allows to perform CRUD operations on static routes. There are three kinds of static-routes:

- 1) Fabric Scoped
- 2) Port Scoped
- 3) External Scoped

### 4.29.1 Get Static Routes:

**Request Method:** GET

**Request URL:**

`https://localhost:8888/api/running/vts-service/sites/site/<site_id>/cisco-vts/tenants/tenant/<TENANT>/topologies/topology/<TOPOLOGY>/router-static-routes/router-static-route/<ROUTER_ID>`

**Sample Response Payload:**

```
{  
  "cisco-vts:router-static-route": {  
    "router-id": "1db02534-806f-4c09-a929-8adde91fc933",  
    "static-routes": {  
      "static-route": [  
        {  
          "prefix": "2.2.2.0/32",  
          "route-scope": "route-scope-external",  
          "next-hops": {  
            "next-hop": [  
              {  
                "index": 0,  
                "nh-addr": "2.2.2.0",  
                "ext-nh-vrf": "vrf",  
                "weight": 33  
              }  
            ]  
          },  
          "route-tag": 23  
        }  
      ]  
    }  
  }  
}
```

### 4.29.2 Create Static Route

**Request Method:** PUT

---

**Request URL:**

`https://localhost:8888/api/running/vts-service/sites/site/<site_id>/cisco-vts/tenants/tenant/<TENANT>/topologies/topology/<TOPOLOGY>/router-static-routes/router-static-route/<ROUTER_ID>`

**4.29.2.1 Sample Payload:**

```
{
  "router-static-route": {
    "router-id": "1db02534-806f-4c09-a929-8adde91fc933",
    "static-routes": {
      "static-route": [
        {
          "prefix": "1.1.1.0/32",
          "route-scope": "route-scope-fabric",
          "next-hops": {
            "next-hop": [
              {
                "index": 0,
                "nh-addr": "2.2.2.0",
                "nh-vrf": "vrf"
              }
            ]
          }
        },
        {
          "prefix": "2.2.2.0/32",
          "route-scope": "route-scope-external",
          "next-hops": {
            "next-hop": [
              {
                "index": 0,
                "weight": 56,
                "nh-addr": "3.3.3.0"
              },
              {
                "index": 1,
                "nh-addr": "4.4.4.0",
                "ext-nh-vrf": "vrf"
              }
            ]
          }
        },
        {
          "prefix": "3.3.3.0/32",
          "route-scope": "route-scope-port",
          "next-hops": {
            "next-hop": [
              {
                "index": 0,
                "bfd": "",
                "nh-addr": "5.5.5.0",
                "nh-port": "602c6673-4a8a-48a7-9d9c-4073abbcdf45"
              }
            ]
          }
        }
      ]
    }
  }
}
```

}

#### **4.29.2.2 Fabric Scoped:**

#### 4.29.2.2.1 Payload Fields

Field	Data Type	Mandatory	Description
“router-id”	String	Yes	Router UUID
“prefix”	String	Yes	Ip Prefix Address
“route-scope”	String	Yes	Scope Value— ‘route-scope-fabric’
“route-tag”	Number	No	
“index”	Number	Yes	Unique Index value for next hop entries
“nh-addr”	String	Yes	Next address value
“weight”	String	No	Next hop Preference
“nh-vrf”	String	No	Next Hop vrf

#### 4.29.2.2.2 Sample Payload

```
{  
  "router-static-route": {  
    "router-id": "1db02534-806f-4c09-a929-8adde91fc933",  
    "static-routes": {  
      "static-route": [  
        {  
          "prefix": "1.1.1.0/32",  
          "route-scope": "route-scope-fabric",  
          "next-hops": {  
            "next-hop": [  
              {  
                "index": 0,  
                "nh-addr": "2.2.2.0",  
                "nh-vrf": "vrf"  
              }  
            ]  
          }  
        ]  
      }  
    }  
  }  
}
```

```
}
```

#### 4.29.2.3 Port Scoped

##### 4.29.2.3.1 Payload Fields

Field	Data Type	Mandatory	Description
“router-id”	String	Yes	Router UUID
“prefix”	String	Yes	Ip Prefix Address
“route-scope”	String	Yes	Scope Value– ‘route-scope-port’
“route-tag”	Number	No	
“index”	Number	Yes	Index Id value for next hop entries
“nh-addr”	String	Yes	Next address value
“weight”	String	No	Next hop Preference
“nh-port”	String	No	Port UUID
“bfd”	String	No	Pass empty string “” to enable and <b>null</b> to disable

##### 4.29.2.3.2 Sample Payload

```
{
  "router-static-route": {
    "router-id": "1db02534-806f-4c09-a929-8adde91fc933",
    "static-routes": {
      "static-route": [
        {
          "prefix": "3.3.3.0\32",
          "route-scope": "route-scope-port",
          "next-hops": {
            "next-hop": [
              {
                "index": 0,
                "bfd": "",
                "nh-addr": "5.5.5.0",
                "nh-port": "602c6673-4a8a-48a7-9d9c-4073abbcdf45"
              }
            ]
          }
        ]
      }
    }
  }
}
```

#### 4.29.2.4 External Scoped

##### 4.29.2.4.1 Payload Fields

Field	Data Type	Mandatory	Description
“router-id”	String	Yes	Router UUID
“prefix”	String	Yes	Ip Prefix Address
“route-scope”	String	Yes	Scope – ‘route-scope-external’
“route-tag”	Number	No	
“index”	Number	Yes	Index Id value for next hop entries
“nh-addr”	String	Yes	Next address value
“weight”	String	No	Next hop Preference
“ext-nh-vrf”	String	No	VRF Name

##### 4.29.2.4.2 Sample Payload

```
{
  "router-static-route": {
    "router-id": "1db02534-806f-4c09-a929-8adde91fc933",
    "static-routes": {
      "static-route": [
        {
          "prefix": "2.2.2.0\32",
          "route-scope": "route-scope-external",
          "next-hops": {
            "next-hop": [
              {
                "index": 0,
                "nh-addr": "3.3.3.0"
              }
            ]
          }
        }
      ]
    }
  }
}
```

#### 4.29.3 Update Static Route

**Request Method:** PATCH

**Request URL:**

`https://localhost:8888/api/running/vts-service/sites/site/<site_id>/cisco-vts/tenants/tenant/<TENANT>/topologies/topology/<TOPOLOGY>/router-static-routes/router-static-route/<ROUTER_ID>`

**4.29.3.1 Sample Payload**

```
{  
    "router-static-route": {  
        "router-id": "1db02534-806f-4c09-a929-8adde91fc933",  
        "static-routes": {  
            "static-route": [  
                {  
                    "prefix": "1.1.1.0/32",  
                    "route-scope": "route-scope-fabric",  
                    "next-hops": {  
                        "next-hop": [  
                            {  
                                "index": 0,  
                                "nh-addr": "4.4.4.0"  
                            }  
                        ]  
                    }  
                }  
            ]  
        }  
    }  
}
```

**4.29.4 Delete Static Route****Request Method:** DELETE**Request URL:**

`https://localhost:8888/api/running/vts-service/sites/site/<site_id>/cisco-vts/tenants/tenant/<TENANT>/topologies/topology/<TOPOLOGY>/router-static-routes/router-static-route/<ROUTER_ID>`

## 4.30 BGP Port extension:

### 4.30.1 Payload for Port Extension create:

**Request URL:** <https://<VTC IP>:8888/api/running/vts-service/sites/site/ddf2ec9c-ab59-49ba-8ade-efb8468d5e13/cisco-vts/tenants/tenant/TenantA/topologies/topology/Zone1/port-extensions>

**Request Method:** POST

Content-Type Header application/vnd.yang.data+json

**Request Payload:**

```
{
  "port-extension":{
    "id":"ddf2ec9c-ab59-49ba-8ade-efb8468d5e15",
    "name":"PortExtensionExample",
    "description ":"Port Extension 2",
    "bgp-peering-profile":{
      "bgp-global-config":{
        "route-reflector-mode": "cisco-vts-identities:bgp-rr-none-mode"
      },
      "bgp-neighbors": [
        {
          "neighbor-id": "12.12.12.2",
          "bgp-neighbor-info": {
            "keepalive-interval": 10,
            "hold-time": 30,
            "suppress-4-byte-asn": false,
            "bfd": false,
            "address-families": [
              {
                "default-originate": false,
                "soft-reconfig": false,
                "type": "cisco-vts-identities:ipv4-unicast",
                "send-community": "standard"
              }
            ]
          }
        }
      ]
    }
  }
}
```

#### 4.30.2 Payload for PortExtension -> Port association API:

**Request URL:** <https://<VTC IP>:8888/api/running/vts-service/sites/site/ddf2ec9c-ab59-49ba-8ade-efb8468d5e13/cisco-vts/tenants/tenant/TenantA/topologies/topology/Zone1/pe-mappings>

**Request Method:** POST

Content-Type Header application/vnd.yang.data+json

**Request Payload:**

```
{  
    "pe-mapping": [  
        {  
            "port-id": "f03047b9-d90e-4091-82ef-730c94951ed8",  
            "port-extensions": {  
                "port-extension": [  
                    {  
                        "pe-id": "ddf2ec9c-ab59-49ba-8ade-efb8468d5e15"  
                    }  
                ]  
            }  
        }  
    ]  
}
```

## 5 Debugging and troubleshooting

### 5.1 VTS

#### 5.1.1 Services

There are 4 VTS specific services on VTC :

- 1) ncs: The controller and handles NB API etc.
  - 2) tomcat7: Handles the user interface
  - 3) vtsWebServer: Handles Auto Discovery API and Openstack Plugin installation etc.
  - 4) vts\_Solr: Docker container on VTS that has the Solr Engine for template full search. To check the status of the vts\_Solr you can enter “docker ps -a”
- The above services are managed via the Linux service commands, e.g. “service <service-name> status” to query a service.

#### 5.1.2 Logs

You can execute “show\_tech\_support –ax” command as “root” user to get a .tar file of all VTC logs.

## 6 Appendix

This appendix explains the YANG model for the VTS REST API.

### 6.1 VTS Types

```
module cisco-vts-types {  
  
    namespace "http://cisco.com/ns/yang/vts/types";  
  
    prefix vts-types;  
    import tailf-common {prefix tailf;}  
    import ietf-yang-types {prefix ietf-yang;}  
    import ietf-inet-types {prefix inet;}  
  
    organization "Cisco Systems, Inc.";  
  
    contact  
        "Cisco Systems, Inc.  
         Customer Service  
  
        Postal: 170 West Tasman Drive  
        San Jose, CA 95134
```

---

Tel: +1 800 533-NETS";

description  
"This module contains a collection of YANG definitions  
for Cisco's VTS's management. Specifically, it defines types used in  
the context of VTS.

description
"VTS 2.5
Enhancements:
- Added multi vmm policies.
- Added VTS-SHARED-SUBNETS
";
}

revision "2016-12-15" {
description
"VTS 2.4.1
Enhancements:
- Added leaf overlay-router-vpn-id to routers container that leaf-ref
the Global Route Leaking Service definition in submodule cisco-vts-vpns
Corrections:
- None
";
}

revision "2016-11-15" {
description
"VTS 2.4
Enhancements:
- Added leaf router-gateway-ipv6-address under list router.
Corrections:
- Under router interface list, leaves ip-address and
router-gateway-ip-address modified to support both v4
and v6. Previously, only v4 was supported.
- Added constraint so that a network can only support one
subnet per ip version.
- Added constraint so that the subnet cidr and gateway match
the provided ip-version.
";
}

revision "2016-08-30" {
description
"VTS 2.3.1
Enhancements:
- Added leaf vpn-id to networks container
- Added group VTS-VPNS to cisc-vts container
Corrections:
- Removed unique constraint for subnetworks
- Relaxed must constraint in the leaf interface-name
";
}
```

```
revision "2016-07-15" {
    description
    "VTS 2.3.0
    Enhancements:
        - Added leaf vrf-name under list router. The name must be unique
          across tenants. A must statement enforces this.
        - Added identities for template targets
        - Added leaf vtf-deployment under list vmm
        - Added groupings TEMPLATES-DEVICE-GROUP and TEMPLATE-
TARGET-MAPS
            used under cisco-vts
    Corrections:
        - Removed must constraint for subnet name as it can be any string
        - Added unique statement for leaf name under list router
        - Added must statement so that the name of a subnetwork is unique
          within the scope of a network
        - Added must statement so that an external network cannot contain
          subnetworks attached to a router
        - Modified types used for ip addresses from generic to v4 to reflect
          accurately the expected type
    ";
}

revision "2015-06-15" {

*/\*TODO:*

1. removed the must condition to check template name and template type matching as we changed the template  
to pattern due to NCS issue with using a leaf that is identity-ref as a key of list.
2. The REST POST call doesn't work while passing the value for the identity-ref.
3. Once that issue is resolved we can make the change in this model hence we are using qualified names for  
that reason in the pattern
4. The pattern being on a single line is required as I didn't find a way to mention that it is continuation  
of OR condition on the new line. Once we have new line the pattern was not getting matched.
