`binarySearch(fromIndex, toIndex) { comparator.compare(selector(it), key) }`
Searches this list or its range for an element for which the given [comparison] function returns zero using the binary search algorithm.
The list is expected to be sorted so that the signs of the [comparison] function's return values ascend on the list elements,
i.e. negative values come before zero and zeroes come before positive values.
Otherwise, the result is undefined.
If the list contains multiple elements for which [comparison] returns zero, there is no guarantee which one will be found.
`@param` comparison function that returns zero when called on the list element being searched.
On the elements coming before the target element, the function must return negative values;
on the elements coming after the target element, the function must return positive values.
`@return` the index of the found element, if it is contained in the list within the specified range;
otherwise, the inverted insertion point `(-insertion point - 1)`.
The insertion point is defined as the index at which the element should be inserted,
so that the list (or the specified subrange of list) still remains sorted.

@kotlin.internal.InlineOnly
public inline operator fun <K, V> Map.Entry<K, V>.component1(): K = key

Returns the value component of the map entry.

This method allows to use destructuring declarations when working with maps, for example:
    for ((key, value) in map) {
        // do something with the key and the value
    }

@kotlin.internal.InlineOnly
public inline operator fun <K, V> Map.Entry<K, V>.component2(): V = value

Converts entry to [Pair] with key being first component and value being second.

@kotlin.internal.InlineOnly
public inline fun <K, V> Map.Entry<K, V>.toPair(): Pair<K, V> = Pair(key, value)

Returns the value for the given key, or the result of the [defaultValue] function if there was no entry for the given key.

@sample samples.collections.Maps.Usage.getOrNull

@kotlin.internal.InlineOnly
public inline fun <K, V> Map<K, V>.getOrNull(key: K, defaultValue: () -> V): V = get(key) ?: defaultValue

        return defaultValue()
    }
    else {
        @Suppress("UNCHECKED_CAST")
        return value as V
    }
}

Returns the value for the given [key] or throws an exception if there is no such key in the map.

If the map was created by [withDefault], resorts to its `defaultValue` provider function instead of throwing an exception.

@throws NoSuchElementException when the map doesn't contain a value for the specified key and no implicit default value was provided for that map.

@SinceKotlin("1.1")
public fun <K, V> Map<K, V>.getValue(key: K): V = getOrDefault(key)

Returns the value for the given key. If the key is not found in the map, calls the [defaultValue] function, puts its result into the map under the given key and returns it.

Note that the operation is not guaranteed to be atomic if the map is being modified concurrently.

@sample samples.collections.Maps.Usage.getOrPut

        put(key, answer)
        answer
    } else {

}

Returns an [Iterator] over the entries in the [Map].

@sample samples.collections.Maps.Usage.forOverEntries

@kotlin.internal.InlineOnly
public inline operator fun <K, V> Map<out K, V>.iterator(): Iterator<Map.Entry<K, V>> = entries.iterator()

@kotlin.jvm.JvmName("mutableIterator")
@kotlin.internal.InlineOnly
public inline operator fun <K, V> MutableMap<K, V>.iterator(): MutableIterator<MutableMap.MutableEntry<K, V>> = entries.iterator()

}

Populates the given [destination] map with entries having the keys obtained by applying the [transform] function to each entry in this [Map] and the values of this map.

In case if any two entries are mapped to the equal keys, the value of the latter one will overwrite the value associated with the former one.

public fun <K, V> MutableMap<in K, in V>.putAll(pairs: Iterable<Pair<K, V>>): Unit {
    for ((key, value) in pairs) {

}

Puts all the elements of the given sequence into this [MutableMap] with the first component in the pair being the key and the second the value.

public fun <K, V> MutableMap<in K, in V>.putAll(pairs: Sequence<Pair<K, V>>): Unit {
    for ((key, value) in pairs) {
        put(key, value)

Returns a new map with entries having the keys of this map and the values obtained by applying the [transform] function to each entry in this [Map].

The returned map preserves the entry iteration order of the original map.

Combines this comparator and the given [comparator] such that the latter is applied only when the former considered values equal.

platform.
 Compiled module exposes declarations that are marked with this annotation without name mangling.
 This annotation can be applied to either files or top-level declarations.
 It is currently prohibited to export the following kinds of declarations:
 * `expect` declarations
 * inline functions with reified type parameters
 * suspend functions
 * secondary constructors without `@JsName`
 * extension properties
 * enum classes
 * annotation classes
 Signatures of exported declarations must only contain "exportable" types:
 * `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`, `Double`
 * `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`
 * `Array<exportable-type>`
 * Function types with exportable parameters and return types
 * `external` or `@JsExport` classes and interfaces
 * Nullable counterparts of types above
 * Unit return type. Must not be nullable
 This annotation is experimental, meaning that restrictions mentioned above are subject to change.

Starts an unintercepted coroutine without a receiver and with result type [T] and executes it until its first suspension. Returns the result of the coroutine or throws its exception if it does not suspend or [COROUTINE_SUSPENDED] if it suspends. In the latter case, the [completion] continuation is invoked when the coroutine completes with a result or an exception. The coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. This function is designed to be used from inside of [suspendCoroutineUninterceptedOrReturn] to resume the execution of the suspended coroutine using a reference to the suspending function.

The coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. This function is designed to be used from inside of [suspendCoroutineUninterceptedOrReturn] to resume the execution of the suspended coroutine using a reference to the suspending function.
@SinceKotlin("1.3")@InlineOnly public actual inline fun <R, T> (suspend R.() -> T).startCoroutineUninterceptedOrReturn(receiver: R, completion: Continuation<T>): Any? = this.asDynamic()(receiver, completion, false)
@SinceKotlin("1.3")@Internal public actual inline fun <R, P, T> (suspend R.(P) -> T).startCoroutineUninterceptedOrReturn(receiver: R, param: P, completion: Continuation<T>): Any? = this.asDynamic()(receiver, param, completion, false)
Creates unintercepted coroutine without receiver and with result type [T]. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance. The [completion] continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that [completion] of this function may get invoked in an arbitrary context. [Continuation.intercepted] can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in the invocation context established by [ContinuationInterceptor]. Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.
@SinceKotlin("1.3") public actual fun <T> (suspend () -> T).createCoroutineUnintercepted(completion: Continuation<T>): Continuation<Unit> = if (this.asDynamic().length == 2) { // Kotlin/JS suspend lambdas have an extra parameter `suspended` if (this.asDynamic().length == 2) { // When `suspended` is true the continuation is created, but not executed this.asDynamic()(completion, true) } else { createCoroutineFromSuspendFunction(completion) { this.asDynamic()(completion) } } }

for functions with parameters, which is unnatural for usual JavaScript developer.\n *     You can put `@JsName(...)`
on functions you want to be available from JavaScript.\n *\n * * For some reason you want to rename declaration, e.g.
there's common term in JavaScript\n *     for a concept provided by the declaration, which is uncommon in Kotlin.\n
*\n * Example:\n *\n * ``` kotlin\n * class Person(val name: String) {\n *     fun hello() {\n *         println("Hello
$name!")\n *     }\n *     @JsName("helloWithGreeting")\n *     fun hello(greeting: String) {\n *

declaration itself and for all references to the declaration.\n *     It's required to denote a valid JavaScript

By applying `@JsModule(...)` on a file you tell the compiler to import a JavaScript object\n * that contain all the declarations from the file.\n *\n * Example:\n *\n * ``` kotlin\n * @JsModule("jquery")\n * external abstract class JQuery() {\n * // some declarations here\n * }\n * @JsModule("jquery")\n * external fun JQuery(element: Element): JQuery\n * ```\n *\n * @property import name of a module to import declaration from.\n * It is not interpreted by the Kotlin compiler, it's passed as is directly to the target module system.\n *\n * @see JsNonModule\n\n *\n @Retention(AnnotationRetention.BINARY)\n @Target(CLASS, PROPERTY, FUNCTION, FILE)\n public annotation class JsModule(val import: String)\n\n **\n * Denotes an `external` declaration that can be used without module system.\n *\n * By default, an `external` declaration is available regardless your target module system.\n *\n * However, by applying [JsModule] annotation you can make a declaration unavailable to *plain* module system.\n *\n * Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module available\n * as an npm package.\n * To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation.\n *\n * For example:\n *\n * ``` kotlin\n * @JsModule("jquery")\n * @JsNonModule\n * @JsName("$")\n * external abstract class JQuery() {\n * // some declarations here\n * }\n * @JsModule("jquery")\n * @JsNonModule\n * @JsName("$")\n * external fun JQuery(element: Element): JQuery\n * ```\n *\n * @see JsModule\n\n *\n @Retention(AnnotationRetention.BINARY)\n @Target(CLASS, PROPERTY, FUNCTION, FILE)\n public annotation class JsNonModule\n\n **\n * Adds prefix to `external` declarations in a source file.\n *\n * JavaScript does not have concept of packages (namespaces).
