 \* TODO(cais): Tighten the typing once keras spec is available to tfjs-core.  
`sample_weight_mode?: string;`  
`loss_weights?: number[]|{[key: string]: number};`  
 \* The serialized artifacts of a model, including topology and weights.  
 \* The 'modelTopology', 'trainingConfig', 'weightSpecs' and 'weightData' fields  
 \* of this interface are optional, in order to support topology- or weights-only  
 \* saving and loading.  
 \* Note this interface is used internally in IOHandlers. For the file format  
 \* written to disk as 'model.json', see 'ModelJSON'.  
`export declare interface ModelArtifacts`  
`{`  
 \* Model topology.  
`topology: string;`  
 \* For Keras-style 'tf.Model's, this is a JSON object.  
 \* For TensorFlow-style models (e.g., 'SavedModel'), this is the JSON  
 \* encoding of the 'GraphDef' protocol buffer.  
`modelTopology?: {}|ArrayBuffer;`  
 \* Serialized configuration for the model's training.  
`trainingConfig?: TrainingConfig;`  
 \* Weight specifications.  
`weightSpecs: WeightsManifestEntry[];`  
 \* This corresponds to the weightsData below.  
`weightSpecs?: WeightsManifestEntry[];`  
 \* Binary buffer for all weight values concatenated in the order specified  
 \* by 'weightSpecs'.  
`weightData?: ArrayBuffer;`  
 \*

Hard-coded format name for models saved from TensorFlow.js or converted by TensorFlow.js Converter.

`format?: string;` What library is responsible for originally generating this artifact.

`usedForDebugging?: boolean;` Used for debugging purposes. E.g., 'TensorFlow.js v1.0.0'.

`generatedBy?: string;` What library or tool is responsible for converting the original model to this format, applicable only if the model is output by a converter.

`usedForDebugging?: boolean;` Used for debugging purposes. E.g., 'TensorFlow.js Converter v1.0.0'.

`valueOfNull?: boolean;` A value of `null` means the model artifacts are generated without any conversion process (e.g., saved directly from a TensorFlow.js `tf.LayersModel`` instance).

`convertedBy?: string|null;` Inputs and outputs signature for saved model.

`signature?: { };` User-defined metadata about the model.

`userDefinedMetadata?: {[key: string]: { }};` Initializer for the model.

`modelInitializer?: { };` The on-disk format of the `model.json` file.

`tfjs1.0AlwaysPopulatesOptionalFields?: boolean;` TF.js 1.0 always populates the optional fields when writing model.json. Prior versions did not provide those fields.

`export declare interface ModelJSON {`

`topology: ModelTopology;` Model topology.

`forKerasStyleTfModel?: tf.Model;` For Keras-style `tf.Model`s`, this is a JSON object.

`forTensorFlowStyleModel?: SavedModel;` For TensorFlow-style models (e.g., `SavedModel``), this is the JSON encoding of the `GraphDef`` protocol buffer.

`modelTopology: { };` Model training configuration.

`trainingConfig?: TrainingConfig;` Weights manifest.

`weightsManifest?: WeightsManifest;` The weights manifest consists of an ordered list of weight-manifest groups. Each weight-manifest group consists of a number of weight values stored in a number of paths. See the documentation of `WeightsManifestConfig`` for more details.

`weightsManifest: WeightsManifestConfig;` Hard-coded format name for models saved from TensorFlow.js or converted by TensorFlow.js Converter.

`format?: string;` What library is responsible for originally generating this artifact.

`usedForDebugging?: boolean;` Used for debugging purposes. E.g., 'TensorFlow.js v1.0.0'.

`generatedBy?: string;` What library or tool is responsible for converting the original model to this format, applicable only if the model is output by a converter.

`usedForDebugging?: boolean;` Used for debugging purposes. E.g., 'TensorFlow.js Converter v1.0.0'.

`valueOfNull?: boolean;` A value of `null` means the model artifacts are generated without any conversion process (e.g., saved directly from a TensorFlow.js `tf.LayersModel`` instance).

`convertedBy?: string|null;` Inputs and outputs signature for saved model.

`signature?: { };` User-defined metadata about the model.

`userDefinedMetadata?: {[key: string]: { }};` Initializer for the model.

`modelInitializer?: { };` Type definition for handlers of loading operations.

`export type LoadHandler = () => Promise<ModelArtifacts>;` Type definition for handlers of saving operations.

`export type SaveHandler = (modelArtifact: ModelArtifacts) => Promise<SaveResult>;` Interface for a model import/export handler.

`save? and load? handlers are both optional, in order to allow handlers that support only saving or loading.`

`// tslint:disable-next-line:interface-name` export interface IOHandler {

`save?: SaveHandler;`

`load?: LoadHandler;`

`}`

An interface for the manager of a model store.

A model store is defined as a storage medium on which multiple models can be stored. Each stored model has a unique `path`` as its identifier.

A `ModelStoreManager`` for the store allows actions including

- Listing the models stored in the store.
- Deleting a model from the store.

export interface ModelStoreManager {

`listModels(): Promise<{[path: string]: ModelArtifactsInfo}>;` List all models in the model store.

`@returns A dictionary mapping paths of existing models to their model artifacts info.` Model artifacts info include type of the model's topology, byte sizes of the topology, weights, etc.

`listModels(): Promise<{[path: string]: ModelArtifactsInfo}>;` Remove a model specified by `path``.

`@param path` @returns ModelArtifactsInfo of the deleted model (if and only if deletion is successful).

`@throws Error if deletion fails, e.g., if no model exists at `path`.` removeModel(path: string): Promise<ModelArtifactsInfo>;

`callback for the progress of a long-running action such as an HTTP request for a large binary object.` fraction` should be a number in the [0, 1] interval, indicating how much of the action has completed.

export type OnProgressCallback = (fraction: number) => void;

`@namespace io` export interface LoadOptions {

`requestInit?: RequestInit;` RequestInit (options) for HTTP requests.

`@param path` For detailed information on the supported fields, see [https://developer.mozilla.org/en-US/docs/Web/API/Request/Request] (https://developer.mozilla.org/en-US/docs/Web/API/Request/Request)

`requestInit?: RequestInit;` Progress callback.

onProgress?: OnProgressCallback;\n\n /\*\*\n \* A function used to override the `window.fetch` function.\n \*/\n fetchFunc?: Function;\n\n /\*\*\n \* Strict loading model: whether extraneous weights or missing\n \* weights should trigger an `Error`.\n \*/\n \* If `true`, require that the provided weights exactly match those\n \* required by the layers. `false` means that both extra weights\n \* and missing weights will be silently ignored.\n \*/\n \* Default: `true`.\n \*/\n strict?: boolean;\n\n /\*\*\n \* Path prefix for weight files, by default this is calculated from the\n \* path of the model JSON file.\n \*/\n \* For instance, if the path to the model JSON file is\n \* `http://localhost/foo/model.json`, then the default path prefix will be\n \* `http://localhost/foo/`. If a weight file has the path value\n \* `group1-shard1of2` in the weight manifest, then the weight file will be\n \* loaded from `http://localhost/foo/group1-shard1of2` by default. However,\n \* if you provide a `weightPathPrefix` value of\n \* `http://localhost/foo/alt-weights`, then the weight file will be loaded\n \* from the path `http://localhost/foo/alt-weights/group1-shard1of2` instead.\n \*/\n weightPathPrefix?: string;\n\n /\*\*\n \* Whether the module or model is to be loaded from TF Hub.\n \*/\n \* Setting this to `true` allows passing a TF-Hub module URL, omitting the\n \* standard model file name and the query parameters.\n \*/\n \* Default: `false`.\n \*/\n fromTFHub?: boolean;\n\n /\*\*\n \* An async function to convert weight file name to URL. The weight file\n \* names are stored in model.json's weightsManifest.paths field. By default we\n \* consider weight files are colocated with the model.json file. For example:\n \* model.json URL: https://www.google.com/models/1/model.json\n \* group1-shard1of1.bin url: https://www.google.com/models/1/group1-shard1of1.bin\n \* With this func you can convert the weight file name to any URL.\n \*/\n weightUrlConverter?: (weightFileName: string) => Promise<string>;\n\n\n /\*\*\n \* Additional options for Platform.fetch\n \*/\n\nexport interface RequestDetails {\n\n /\*\*\n \* Is this request for a binary file (as opposed to a json file)\n \*/\n isBinary?: boolean;\n\n\n "use strict"\n\n exports.byteLength = byteLength\n\n exports.toByteArray = toByteArray\n\n exports.fromByteArray = fromByteArray\n\n\n var lookup = []\n\n var revLookup = []\n\n\n var Arr = typeof Uint8Array !== 'undefined' ? * Creates an IOHandler subtype that sends model artifacts to HTTP server.\n * An HTTP request of the
`multipart/form-data` mime type will be sent to the\n * `path` URL. The form data includes artifacts that represent
the topology\n * and/or weights of the model. In the case of Keras-style `tf.Model`, two\n * blobs (files) exist in
form-data:\n * - A JSON file consisting of `modelTopology` and `weightsManifest`.\n * - A binary weights file
consisting of the concatenated weight values.\n * These files are in the same format as the one generated by\n *
[tfjs_converter](https://js.tensorflow.org/tutorials/import-keras.html).\n *\n * The following code snippet
exemplifies the client-side code that uses this\n * function:\n * ```\n * const model = tf.sequential();\n *
model.add(\n *   tf.layers.dense({units: 1, inputShape: [100], activation: 'sigmoid'}));\n * const saveResult =
await model.save(tf.io.http(\n *   'http://model-server:5000/upload', {requestInit: {method: 'PUT'}}));\n *
console.log(saveResult);\n * ```\n *\n * If the default `POST` method is to be used, without any custom parameters\n
* such as headers, you can simply pass an HTTP or HTTPS URL to `model.save`:\n * ```\n * const saveResult
= await model.save('http://model-server:5000/upload');\n * ```\n *\n * The following GitHub Gist\n *
https://gist.github.com/dsmilkov/1b6046fd6132d7408d5257b0976f7864\n * implements a server based on
[flask](https://github.com/pallets/flask) that\n * can receive the request. Upon receiving the model artifacts via the
request,\n * this particular server reconstitutes instances of [Keras\n * Models](https://keras.io/models/model/) in
memory.\n * \n * @param path A URL path to the model.\n * Can be an absolute HTTP path (e.g.,\n *
'http://localhost:8000/model-upload') or a relative path (e.g.,\n * './model-upload').\n * @param requestInit
Request configurations to be used when sending\n * HTTP request to server using `fetch`. It can contain fields
such as\n * `method`, `credentials`, `headers`, `mode`, etc. See\n * https://developer.mozilla.org/en-
US/docs/Web/API/Request/Request\n * for more information. `requestInit` must not have a body, because the\n *
body will be set by TensorFlow.js. File blobs representing the model\n * topology (filename: 'model.json') and the
weights of the model (filename:\n * 'model.weights.bin') will be appended to the body. If `requestInit` has a\n *
`body`, an Error will be thrown.\n * @param loadOptions Optional configuration for the loading. It includes the\n *
following fields:\n * - weightPathPrefix Optional, this specifies the path prefix for weight\n * files, by default
this is calculated from the path param.\n * - fetchFunc Optional, custom `fetch` function. E.g., in Node.js,\n * the
`fetch` from node-fetch can be used here.\n * - onProgress Optional, progress callback function, fired
periodically\n * before the load is completed.\n * @returns An instance of `IOHandler`.\n * @doc {\n *
heading: 'Models',\n * subheading: 'Loading',\n * namespace: 'io',\n * ignoreCI: true\n * }\n *\nexport function

```

following properties:

- `numBytes``: Number of bytes allocated (undisposed) at this time.
- `numTensors``: Number of unique tensors allocated.
- `numDataBuffers``: Number of unique data buffers allocated (undisposed) at this time, which is the number of tensors (e.g. `a.reshape(newShape)`) makes a new Tensor that shares the same data buffer with `a`).
- `unreliable``: True if the memory usage is unreliable. See `reasons`` when `unreliable`` is true.
- `reasons``: `string[]`, reasons why the memory is unreliable, present if `unreliable`` is true.

WebGL Properties:

- `numBytesInGPU``: Number of bytes allocated (undisposed) in the GPU only at this time.

@doc {heading: 'Performance', subheading: 'Memory'}

memory(): `MemoryInfo` {`return ENGINE.memory();`};

Executes the provided function `f()` and returns a promise that resolves with information about the function's memory use:

- `newBytes``: the number of new bytes allocated
- `newTensors``: the number of new tensors created
- `peakBytes``: the peak number of bytes allocated
- `kernels``: an array of objects for each kernel involved that reports their input and output shapes, number of bytes used, and number of new tensors created.
- `kernelNames``: an array of unique strings with just the names of the kernels in the `kernels`` array.

```
js
const profile = await
tf.profile(() => {
  const x = tf.tensor1d([1, 2, 3]);
  let x2 = x.square();
  x2.dispose();
  x2 =
x.square();
  x2.dispose();
  return x;
});
console.log(`newBytes: ${profile.newBytes}`);
console.log(`newTensors: ${profile.newTensors}`);
console.log(`byte usage over all kernels:
${profile.kernels.map(k => k.totalBytesSnapshot)}`);

```

@doc {heading: 'Performance', subheading: 'Profile'}

profile(f: () => (TensorContainer | Promise<TensorContainer>)): `Promise<ProfileInfo>` {`return ENGINE.profile(f);`};

Executes the provided function `fn`` and after it is executed, cleans up all intermediate tensors allocated by `fn`` except those returned by `fn``. `fn`` must not return a Promise (async functions not allowed). The returned result can be a complex object.

Using this method helps avoid memory leaks. In general, wrap calls to operations in `tf.tidy`` for automatic memory cleanup.

NOTE: Variables do not get cleaned up when inside a `tidy()`. If you want to dispose variables, please use `tf.disposeVariables`` or call `dispose()` directly on variables.

```
js
// y = 2 ^ 2 + 1
const y = tf.tidy(() => {
  // a, b, and one will be cleaned up when the tidy ends.
  const one = tf.scalar(1);
  const a = tf.scalar(2);
  const b = a.square();
  console.log(`numTensors (in tidy): ` +
tf.memory().numTensors);
  // The value returned inside the tidy function will return
  // through the tidy, in this case to the variable y.
  return b.add(one);
});
console.log(`numTensors (outside tidy): ` +
tf.memory().numTensors);
y.print();

```

@param nameOrFn The name of the closure, or the function to execute.

If a name is provided, the 2nd argument should be the function.

If debug mode is on, the timing and the memory usage of the function will be tracked and displayed on the console using the provided name.

@param fn The function to execute.

@doc {heading: 'Performance', subheading: 'Memory'}

tidy<T extends TensorContainer>(nameOrFn: string|ScopeFn<T>, fn?: ScopeFn<T>): T {`return ENGINE.tidy(nameOrFn, fn);`};

Disposes any `tf.Tensor``s found within the provided object.

@param container an object that may be a `tf.Tensor`` or may directly contain `tf.Tensor``s, such as a `Tensor[]`` or `{key: Tensor, ...}``. If the object is not a `tf.Tensor`` or does not contain `Tensors``, nothing happens. In general it is safe to pass any object here, except that `Promise``s are not supported.

@doc {heading: 'Performance', subheading: 'Memory'}

dispose(container: TensorContainer) {`const tensors = getTensorsInContainer(container);` `tensors.forEach(tensor => tensor.dispose());`};

Keeps a `tf.Tensor`` generated inside a `tf.tidy`` from being disposed automatically.

```
js
let b;
const y = tf.tidy(() => {
  const one = tf.scalar(1);
  const a = tf.scalar(2);
  // b will not be cleaned up
  by the tidy. a and one will be cleaned up
  // when the tidy ends.
  b = tf.keep(a.square());
  console.log(`numTensors (in tidy): ` + tf.memory().numTensors);
  // The value returned inside the tidy
  function will return
  // through the tidy, in this case to the variable y.
  return b.add(one);
});
console.log(`numTensors (outside tidy): ` + tf.memory().numTensors);
console.log('y:');
y.print();
console.log('b:');
b.print();

```

@param result The tensor to keep from being disposed.

@doc {heading: 'Performance', subheading: 'Memory'}

keep<T extends Tensor>(result: T): T {`return ENGINE.keep(result);`};

Executes `f()` and returns a promise that resolves with timing

information.
 * The result is an object with the following properties:
 * - `wallMs`: Wall execution time.
 * - `kernelMs`: Kernel execution time, ignoring data transfer. If using the WebGL backend and the query timer extension is not available, this will return an error object.
 * - On `WebGL` The following additional properties exist:
 * - `uploadWaitMs`: CPU blocking time on texture uploads.
 * - `downloadWaitMs`: CPU blocking time on texture downloads (readPixels).
 * ``js` const x = tf.randomNormal([20, 20]);` const time = await tf.time(() => x.matMul(x));` console.log(`kernelMs: \${time.kernelMs}, wallTimeMs: \${time.wallMs}`);`
 * @param f The function to execute and time.
 * @doc {heading: 'Performance', subheading: 'Timing'}
 * ^/next export function time(f: () => void): Promise<TimingInfo> {
 * return ENGINE.time(f);
 * }
 * Sets the backend (cpu, webgl, wasm, etc) responsible for creating tensors and executing operations on those tensors. Returns a promise that resolves to a boolean if the backend initialization was successful.
 * Note this disposes the current backend, if any, as well as any tensors associated with it. A new backend is initialized, even if it is of the same type as the previous one.
 * @param backendName The name of the backend. Currently supports `webgl|cpu` in the browser, `tensorflow` under node.js (requires tfjs-node), and `wasm` (requires tfjs-backend-wasm).
 * @doc {heading: 'Backends'}
 * ^/next export function setBackend(backendName: string): Promise<boolean> {
 * return ENGINE.setBackend(backendName);
 * }
 * Returns a promise that resolves when the currently selected backend (or the highest priority one) has initialized. Await this promise when you are using a backend that has async initialization.
 * @doc {heading: 'Backends'}
 * ^/next export function ready(): Promise<void> {
 * return ENGINE.ready();
 * }
 * Returns the current backend name (cpu, webgl, etc). The backend is responsible for creating tensors and executing operations on those tensors.
 * @doc {heading: 'Backends'}
 * ^/next export function getBackend(): string {
 * return ENGINE.backendName;
 * }
 * Removes a backend and the registered factory.
 * @doc {heading: 'Backends'}
 * ^/next export function removeBackend(name: string): void {
 * ENGINE.removeBackend(name);
 * }
 * Finds the backend registered under the provided name. Returns null if the name is not in the registry, or the registration hasn't finished yet.
 * ^/next export function findBackend(name: string): KernelBackend {
 * return ENGINE.findBackend(name);
 * }
 * Finds the backend factory registered under the provided name. Returns a function that produces a new backend when called. Returns null if the name is not in the registry.
 * ^/next export function findBackendFactory(name: string): () => KernelBackend | Promise<KernelBackend> {
 * return ENGINE.findBackendFactory(name);
 * }
 * Registers a global backend. The registration should happen when importing a module file (e.g. when importing `backend_webgl.ts`), and is used for modular builds (e.g. custom tfjs bundle with only webgl support).
 * @param factory The backend factory function. When called, it should return a backend instance, or a promise of an instance.
 * @param priority The priority of the backend (higher = more important). In case multiple backends are registered, the priority is used to find the best backend. Defaults to 1.
 * @return False if there is already a registered backend under this name, true if not.
 * @doc {heading: 'Backends'}
 * ^/next export function registerBackend(name: string, factory: () => KernelBackend | Promise<KernelBackend>, priority = 1): boolean {
 * return ENGINE.registerBackend(name, factory, priority);
 * }
 * Gets the current backend. If no backends have been initialized, this will attempt to initialize the best backend. Will throw an error if the highest priority backend has async initialization, in which case, you should call `await tf.ready()` before running other code.
 * @doc {heading: 'Backends'}
 * ^/next export function backend(): KernelBackend {
 * return ENGINE.backend;
 * }
 * Sets the global platform.
 * @param platformName The name of this platform.
 * @param platform A platform implementation.
 * ^/next export function setPlatform(platformName: string, platform: Platform) {
 * env().setPlatform(platformName, platform);
 * }
 * @license Copyright 2020 Google LLC. All Rights Reserved. Licensed under the Apache License, Version 2.0 (the "License"); you may not use this file except in compliance with the License. rank 2, of shape `[batch, width, inChannels]`. If rank 2, batch of 1 is assumed.  
 rank 3, of shape `[filterWidth, inDepth, outDepth]`.  
 @param filter The filter, rank 3, of shape `[filterWidth, inDepth, outDepth]`.  
 @param stride The number of entries by which the filter is moved right at each step.  
 @param pad The type of padding algorithm. - `same` and stride 1: output will be of same size as input, regardless of filter size. - `valid`: output will be smaller than input if filter is larger than 1x1.  
 - For more info, see this guide:

[https://www.tensorflow.org/api\\_guides/python/nn#Convolution](https://www.tensorflow.org/api_guides/python/nn#Convolution)

[https://www.tensorflow.org/api\\_guides/python/nn#Convolution](https://www.tensorflow.org/api_guides/python/nn#Convolution)  
 @param dataFormat An optional string from `"NWC"`, `"NCW"`. Defaults to `"NWC"`, the data is stored in the order of `[batch, in_width, in_channels]`. Only `"NWC"` is currently supported.  
 @param dilation The dilation rate in which we sample input values in atrous convolution. Defaults to `1`. If it is greater than 1, then stride must be `1`.  
 @param dimRoundingMode A string from: `'ceil'`, `'round'`, `'floor'`. If none is provided, it will default to truncate.

```

inChannels]. If rank 3, batch of 1 is assumed.

`@param filterSize` The filter size: `[filterHeight, filterWidth]`. If `filterSize` is a single number, then `filterHeight == filterWidth`.

`@param strides` The strides of the pooling: `[strideHeight, strideWidth]`. If `strides` is a single number, then `strideHeight == strideWidth`.

`@param dataFormat` An optional string from: `"NDHWC"`, `"NCDHW"`. Defaults to `"NDHWC"`. Specify the data format of the input and output data. With the default format `"NDHWC"`, the data is stored in the order of: `[batch, depth, height, width, channels]`. Only `"NDHWC"` is currently supported.

`@param pad` The type of padding algorithm. `same` and stride 1: output will be of same size as input, regardless of filter size. `valid`: output will be smaller than input if filter is larger than `1x1`.

- For more info, see this guide: [https://www.tensorflow.org/api\\_guides/python/nn#Convolution](https://www.tensorflow.org/api_guides/python/nn#Convolution)

`@param includeBatchIndex` Defaults to `False`. Whether to include batch dimension in flattened index of `argmax`.

`@doc {heading: 'Operations', subheading: 'Convolution'}`

```

def maxPoolWithArgmax_<T extends Tensor4D>(x: T|TensorLike,

*^import {ENGINE} from './engine';import {SpaceToBatchND, SpaceToBatchNDAttrs,
```

```

SpaceToBatchNDInputs} from './kernel_names';\nimport {NamedAttrMap} from './kernel_registry';\nimport
{Tensor} from './tensor';\nimport {NamedTensorMap} from './tensor_types';\nimport {convertToTensor} from
 './tensor_util_env';\nimport {TensorLike} from './types';\nimport * as util from './util';\n\nimport {op} from
 './operation';\n\n/**\n * This operation divides \"spatial\" dimensions `[1, ..., M]` of the input into\n * a grid of
 blocks of shape `blockShape`, and interleaves these blocks with\n * the `\"batch\"` dimension (0) such that in the
 output, the spatial\n * dimensions `[1, ..., M]` correspond to the position within the grid,\n * and the batch dimension
 combines both the position within a spatial block\n * and the original batch position. Prior to division into blocks,\n
 * the spatial dimensions of the input are optionally zero padded\n * according to `paddings`. See below for a precise
 description.\n *\n * ```js\n * const x = tf.tensor4d([1, 2, 3, 4], [1, 2, 2, 1]);\n * const blockShape = [2, 2];\n * const
 paddings = [[0, 0], [0, 0]];\n *\n * x.spaceToBatchND(blockShape, paddings).print();\n *\n * @param x A
 `tf.Tensor`. N-D with `x.shape` = `[batch] + spatialShape +\n * remainingShape`, where spatialShape has `M`
 dimensions.\n * @param blockShape A 1-D array. Must have shape `[M]`, all values must\n * be  $\geq 1$ .
 @param
 paddings A 2-D array. Must have shape `[M, 2]`, all values must be  $\geq 0$ . `paddings[i] = [padStart, padEnd]`
 specifies the amount to zero-pad\n * from input dimension `i + 1`, which corresponds to spatial dimension `i`. It\n
 * is required that\n * `(inputShape[i + 1] + padStart + padEnd) % blockShape[i] === 0`\n *\n * This operation is
 equivalent to the following steps:\n *\n * 1. Zero-pad the start and end of dimensions `[1, ..., M]` of the input\n
 * according to `paddings` to produce `padded` of shape paddedShape.\n *\n * 2. Reshape `padded` to
 `reshapedPadded` of shape:\n * `[batch] + [paddedShape[1] / blockShape[0], blockShape[0], ..., \n
 * paddedShape[M] / blockShape[M-1], blockShape[M-1]] + remainingShape`\n *\n * 3. Permute dimensions of
 `reshapedPadded` to produce `permutedReshapedPadded`\n * of shape: `blockShape + [batch] + [paddedShape[1] /
 blockShape[0], ..., \n
 * paddedShape[M] / blockShape[M-1]] + remainingShape`\n *\n * 4. Reshape
 `permutedReshapedPadded` to flatten `blockShape` into the\n * batch dimension, producing an output tensor of
 shape:\n * `[batch * prod(blockShape)] + [paddedShape[1] / blockShape[0], ..., \n
 * paddedShape[M] /
 blockShape[M-1]] + remainingShape`\n *\n * @doc {heading: 'Tensors', subheading: 'Transformations'}\n

```

rank 4 or rank 3 of shape `[batch, height, width, inChannels]`. If rank 3, batch of 1 is assumed.

`@param windowShape` The filter size: `[filterHeight, filterWidth]`. If `filterSize` is a single number, then `filterHeight == filterWidth`.

`@param poolingType` The type of pooling, either 'max' or 'avg'.

`@param pad` The type of padding algorithm: `'same'` and stride 1: output will be of same size as input, regardless of filter size.

`'valid'`: output will be smaller than input if filter is larger than 1x1. - For more info, see this guide: https://www.tensorflow.org/api_guides/python/nn#Convolution

`@param dilations` The dilation rates: `[dilationHeight, dilationWidth]` in which we sample input values across the height and width dimensions in dilated pooling. Defaults to `[1, 1]`. If `dilationRate` is a single number, then `dilationHeight == dilationWidth`. If it is greater than 1, then all values of `strides` must be 1.

`@param strides` The strides of the pooling: `[strideHeight, strideWidth]`. If `strides` is a single number, then `strideHeight == strideWidth`.

```

, "A Javascript implementaion of Richard Brent's Xorgens xor4096 algorithm."
, "This fast non-cryptographic random number generator is designed for use in Monte-Carlo algorithms. It combines a long-period xorshift generator with a Weyl generator, and it passes all common batteries of stastical tests for randomness while consuming only a few nanoseconds for each prng generated. For background on the generator, see Brent's paper: 'Some long-period random number generators using shifts and xors.'"
, http://arxiv.org/pdf/1004.3115v1.pdf
, Usage:
var xor4096 = require('xor4096');
random = xor4096(1); // Seed with int32 or string.
assert.equal(random(), 0.1520436450538547); // (0, 1) range, 53 bits.
assert.equal(random.int32(), 1806534897); // signed int32, 32 bits.
// For nonzero numeric keys, this impelementation provides a sequence identical to that by Brent's xorgens 3 implementaion in C. This implementation also provides for initalizing the generator with string seeds, or for saving and restoring the state of the generator.
// On Chrome, this prng benchmarks about 2.1 times slower than Javascript's built-in Math.random().

If rank 3, batch
```

of 1 is assumed.

`@param filter` The filter, rank 4, of shape `[filterHeight, filterWidth, inDepth, outDepth]`.

`@param strides` The strides of the convolution: `[strideHeight, strideWidth]`.

`@param pad` The type of padding algorithm. `'same'` and stride 1: output will be of same size as input, regardless of filter size. `'valid'` output will be smaller than input if filter is larger than 1x1.

For more info, see this guide: https://www.tensorflow.org/api_guides/python/nn#Convolution

`@param dataFormat` An optional string from: `'NHWC'`, `'NCHW'`. Defaults to `'NHWC'`. Specify the data format of the input and output data. With the default format `'NHWC'`, the data is stored in the order of: [batch, height, width, channels]. Only `'NHWC'` is currently supported.

`@param dilations` The dilation rates: `[dilationHeight, dilationWidth]` in which we sample input values across the height and width dimensions in atrous convolution. Defaults to `[1, 1]`. If `dilations` is a single number, then `dilationHeight == dilationWidth`. If it is greater than 1, then all values of `strides` must be 1.

`@param dimRoundingMode` A string from: `'ceil'`, `'round'`, `'floor'`. If none is provided, it will default to `truncate`.

`@param bias` Tensor to be added to the result.

`@param activation` Name of activation kernel (defaults to `'linear'`) to be applied after `biasAdd`.

`@param preluActivationWeights` Tensor of prelu weights to be applied as part of a `'prelu'` activation, typically the same shape as `x`.

`@param leakyreluAlpha` Optional. Alpha to be applied as part of a `'leakyrelu'` activation.

shape\n * `[filterHeight, filterWidth, inChannels, channelMultiplier]`. \n * @param strides The strides of the
convolution: `[strideHeight,\n * strideWidth]`. If strides is a single number, then `strideHeight ==\n *
strideWidth`. \n * @param pad The type of padding algorithm.\n * - `same` and stride 1: output will be of same size
=====

```

as input, regardless of filter size. - `valid`: output will be smaller than input if filter is larger than 1x1. - For more info, see this guide: https://www.tensorflow.org/api_guides/python/nn#Convolution

`https://www.tensorflow.org/api_guides/python/nn#Convolution`

@param dilations The dilation rates: `[dilationHeight, dilationWidth]` in which we sample input values across the height and width dimensions in atrous convolution. Defaults to `[1, 1]`. If `rate` is a single number, then `dilationHeight == dilationWidth`. If it is greater than 1, then all values of `strides` must be 1.

@param dataType: An optional string from: `"NHWC"`, `"NCHW"`. Defaults to `"NHWC"`. Specify the data format of the input and output data. With the default format `"NHWC"`, the data is stored in the order of: [batch, height, width, channels]. Only `"NHWC"` is currently supported.

@param dimRoundingMode A string from: 'ceil', 'round', 'floor'. If none is provided, it will default to truncate.

@param bias Tensor to be added to the result.

@param activation Name of activation kernel (defaults to `linear`).

@param preluActivationWeights Tensor of prelu weights to be applied as part of a `prelu` activation, typically the same shape as `x`.

@param leakyreluAlpha Optional. Alpha to be applied as part of a `leakyrelu` activation.

```

```

```

* Computes softmax cross entropy between logits and labels.
* Measures the probability error in discrete
classification tasks in which
* the classes are mutually exclusive (each entry is in exactly one class).
* For
example, each CIFAR-10 image is labeled with one and only one label: an
* image can be a dog or a truck, but not
both.
* `NOTE` : While the classes are mutually exclusive, their probabilities need
* not be. All that is
required is that each row of labels is a valid
* probability distribution. If they are not, the computation of the
gradient
* will be incorrect.
* `WARNING` : This op expects unscaled logits, since it performs a softmax
on
* logits internally for efficiency. Do not call this op with the output of
* softmax, as it will produce incorrect
results.
* logits and labels must have the same shape, e.g. [batch_size, num_classes]
* and the same dtype.
* @param labels The labels array.
* @param logits The logits array.
* @param dim The dimension softmax
would be performed on. Defaults to -1
* which indicates the last dimension.

=====
import {OpExecutor, OpMapper} from './types';
const CUSTOM_OPS: {[key: string]: OpMapper} =
{};

Register an Op for graph model executor. This allow you to register TensorFlow custom op or
override existing op. Here is an example of registering a new MatMul Op.

const customMatmul = (node) => {
  tf.matmul(node.inputs[0], node.inputs[1], {
    transpose_a: node.attrs['transpose_a'],
    transpose_b: node.attrs['transpose_b'];
  });
  tf.registerOp('MatMul', customMatmul);
};

The inputs and attrs of the node object is based on the TensorFlow registry.

@param name The Tensorflow Op name.
@param opFunc An op function which is called with the current graph node during execution and needs to
return a tensor or a list of tensors. The node has the following attributes:
- attr: A map from attribute name to its value
- inputs: A list of input tensors
@doc {heading: 'Models', subheading: 'Op Registry'}

export function registerOp(name: string, opFunc: OpExecutor) {
  const opMapper: OpMapper = {
    tfOpName: name,
    category: 'custom',
    inputs: [],
    attrs: [],
    customExecutor: opFunc
  };
  CUSTOM_OPS[name] = opMapper;
}

Retrieve the OpMapper object for the registered op.

@param name The Tensorflow Op name.
@doc {heading: 'Models', subheading: 'Op Registry'}

export function getRegisteredOp(name: string): OpMapper {
  return CUSTOM_OPS[name];
}

Deregister the Op for graph model executor.

@param name The Tensorflow Op name.
@doc {heading: 'Models', subheading: 'Op Registry'}

export function deregisterOp(name: string) {
  delete CUSTOM_OPS[name];
}
