```

`providedIn` determines which injectors will include the injectable, by either associating it with an @NgModule or other InjectorType, or by specifying that this injectable should be provided in the 'root' injector, which will be the application-level injector in most apps. factory` gives the zero argument function which will create an instance of the injectable. The factory can call inject` to access the Injector` and request injection of dependencies.`

```

@codeGenApi @publicApi This instruction has been emitted by ViewEngine for some time and is deployed to npm.
export function defineInjectable<T>(opts: { token: unknown, providedIn?: Type<any> | 'root' | 'platform' | 'any' | null, factory: () => T, }): never {
 return ({ token: opts.token, providedIn: opts.providedIn as any || null, factory: opts.factory, value: undefined }) as InjectableDef<T> as never;
}

```

`@deprecated in v8, delete after v10. This API should be used only by generated code, and that code should now use defineInjectable instead. @publicApi`

```

export const defineInjectable = defineInjectable;

```

`Construct an InjectorDef` which configures an injector. This should be assigned to a static injector def (inj` field on a type, which will then be an InjectorType`. Options: factory` : an InjectorType` is an instantiable type, so a zero argument factory` function to create the type must be provided. If that factory function needs to inject arguments, it can use the inject` function. providers` : an optional array of providers to add to the injector. Each provider must either have a factory or point to a type which has a prov` static property (the type must be an InjectableType`. imports` : an optional array of imports of other InjectorType`s or InjectorTypeWithModule`s whose providers will also be added to the injector. Locally provided types will override providers from imports.`

```

@codeGenApi export function defineInjector(options: { factory: () => any, providers?: any[], imports?: any[] }): never {
 return ({ factory: options.factory, providers: options.providers || [], imports: options.imports || [], } as InjectorDef<any>) as never;
}

```

Defines template and style encapsulation options available for Component's { @link Component}.
See { @link Component#encapsulation encapsulation}.
@usageNotes
Example
{ @example core/ts/metadata/encapsulation.ts region='longform'}
@publicApi
export enum ViewEncapsulation {
 /** Emulate `Native` scoping of styles by adding an attribute containing surrogate id to the Host Element and pre-processing the style rules provided via { @link Component#styles styles} or { @link Component#styleUrls styleUrls}, and adding the new Host Element attribute to all selectors.
 * This is the default option.
 * Emulated = 0,
 * Historically the 1 value was for `Native` encapsulation which has been removed as of v11.
 * Don't provide any template or style encapsulation.
 * None = 2,
 * Use Shadow DOM to encapsulate styles.
 * For the DOM this means using modern [Shadow DOM](https://w3c.github.io/webcomponents/spec/shadow/) and creating a ShadowRoot for Component's Host Element.
 * ShadowDom = 3
 */
 None = 0,
 Emulated = 1,
 ShadowDom = 2,
}

Directive type, needed to configure the injector.\n *\n type: Type<T>;\n\n /*\n * The selectors that will be used to
match nodes to this component.\n *\n selectors?: CssSelectorList;\n\n /*\n * The number of nodes, local refs, and
pipes in this component template.\n *\n * Used to calculate the length of this component's LView array, so we\n
*\n * can pre-fill the array and set the binding start index.\n *\n // TODO(kara): remove queries from this count\n
decls: number;\n\n /*\n * The number of bindings in this component template (including pure fn bindings).\n\n
*\n * Used to calculate the length of this component's LView array, so we\n * can pre-fill the array and set the
host binding start index.\n *\n vars: number;\n\n /*\n * A map of input names.\n *\n * The format is in:
`{actualPropertyName: string}:(string|[string, string])`. \n *\n * Given:\n * ```\n * class MyComponent {\n *
@Input()\n * publicInput1: string;\n *\n * @Input('publicInput2')\n * declaredInput2: string;\n * }\n *
```\n *\n * is described as:\n * ```\n * {\n * publicInput1: 'publicInput1',\n * declaredInput2:
['publicInput2', 'declaredInput2'],\n * }\n * ```\n *\n * Which the minifier may translate to:\n * ```\n * {\n
* minifiedPublicInput1: 'publicInput1',\n * minifiedDeclaredInput2: ['publicInput2', 'declaredInput2'],\n * }\n *
```\n *\n * This allows the render to re-construct the minified, public, and declared names\n * of properties.\n
*\n * NOTE:\n * - Because declared and public name are usually same we only generate the array\n *
`['public', 'declared']` format when they differ.\n * - The reason why this API and `outputs` API is not the same is
that `NgOnChanges` has\n * inconsistent behavior in that it uses declared names rather than minified or public.
For\n * this reason `NgOnChanges` will be deprecated and removed in future version and this\n * API will be

```

simplified to be consistent with `output``.  
`inputs?: {[P in keyof T]?: string | [string, string]}`  
 A map of output names.  
 The format is in: `{[actualPropertyName: string]: string}`.  
 Which the minifier may translate to: `{[minifiedPropertyName: string]: string}`.  
 This allows the render to re-construct the minified and non-minified names of properties.  
`outputs?: {[P in keyof T]?: string}`  
 Function executed by the parent template to allow child directive to apply host bindings.  
`hostBindings?: HostBindingsFunction<T>`  
 The number of bindings in this directive `hostBindings`` (including pure fn bindings).  
 Used to calculate the length of the component's LView array, so we can pre-fill the array and set the host binding start index.  
`hostVars?: number`  
 Assign static attribute values to a host element.  
 This property will assign static attribute values as well as class and style values to a host element. Since attribute values can consist of different types of values, the `hostAttrs`` array must include the values in the following format:  
`attrs = [ // static attributes (like `title`, `name`, `id`...)  
 attr1, value1, attr2, value, // a single namespace value (like `x:id`)  
 NAMESPACE_MARKER, namespaceUri1, name1, value1, // another single namespace value (like `x:name`)  
 NAMESPACE_MARKER, namespaceUri2, name2, value2, // a series of CSS classes that will be applied to the element (no spaces)  
 CLASSES_MARKER, class1, class2, class3, // a series of CSS styles (property + value) that will be applied to the element  
 STYLES_MARKER, prop1, value1, prop2, value2 ]`  
 All non-class and non-style attributes must be defined at the start of the list first before all class and style values are set. When there is a change in value type (like when classes and styles are introduced) a marker must be used to separate the entries. The marker values themselves are set via entries found in the `[AttributeMarker]` enum.  
`hostAttrs?: TAttributes`  
 Function to create instances of content queries associated with a given directive.  
`contentQueries?: ContentQueriesFunction<T>`  
 Defines the name that can be used in the template to assign this directive to a variable.  
 See: `{@link Directive.exportAs}`  
`exportAs?: string[]`  
 Template function use for rendering DOM.  
 This function has following structure.  
`function Template<T>(ctx:T, creationMode: boolean) {  
 if (creationMode) {  
 // Contains creation mode instructions.  
 }  
 // Contains binding update instructions  
}`  
 Common instructions are:  
 Creation mode instructions:  
`elementStart``, `elementEnd``  
`text``  
`container``  
`listener``  
 Binding update instructions:  
`bind``  
`elementAttribute``  
`elementProperty``  
`elementClass``  
`elementStyle``  
 template: `ComponentTemplate<T>`  
 Constants for the nodes in the component's view.  
 Includes attribute arrays, local definition arrays etc.  
`consts?: TConstantsOrFactory`  
 An array of `NgContent[selector]` values that were found in the template.  
`ngContentSelectors?: string[]`  
 Additional set of instructions specific to view query processing. This could be seen as a set of instruction to be inserted into the template function.  
 Query-related instructions need to be pulled out to a specific function as a timing of execution is different as compared to all other instructions (after change detection hooks but before view hooks).  
`viewQuery?: ViewQueriesFunction<T> | null`  
 A list of optional features to apply.  
 See: `{@link NgOnChangesFeature}`, `{@link ProvidersFeature}`  
`features?: ComponentDefFeature[]`  
 Defines template and style encapsulation options available for Component's `{@link Component}`.  
`encapsulation?: ViewEncapsulation`  
 Defines arbitrary developer-defined data to be stored on a renderer instance.  
 This is useful for renderers that delegate to other renderers.  
 see: `animation`  
`data?: {[kind: string]: any}`  
 A set of styles that the component needs to be present for component to render correctly.  
`styles?: string[]`  
 The strategy that the default change detector uses to detect changes.  
 When set, takes effect the next time change detection is triggered.  
`changeDetection?: ChangeDetectionStrategy`  
 Registry of directives and components that may be found in this component's view.  
 The property is either an array of `DirectiveDef`s` or a function which returns the array of `DirectiveDef`s`. The function is necessary to be able to support forward declarations.  
`directives?: DirectiveTypesOrFactory | null`  
 Registry of pipes that may be found in this component's view.  
 The property is either an array of `PipeDef`s` or a function which returns the array of `PipeDef`s`. The

```

function is necessary to be able to support forward declarations.\n *^n pipes?: PipeTypesOrFactory | null;\n\n
/**\n * The set of schemas that declare elements to be allowed in the component's template.\n *^n schemas?:

See LViewFlags for more info.\n */\n [FLAGS]: LViewFlags;\n\n /**\n * This may store an {@link LView} or {@link LContainer}.\n *\n * `LView` - The parent view. This is needed when we exit the view and must restore the previous\n * LView. Without this, the render method would have to keep a stack of\n * views as it is recursively rendering templates.\n *\n * `LContainer` - The current view is part of a container, and is an embedded view.\n */\n [PARENT]: LView|LContainer|null;\n\n /**\n * The next sibling LView or LContainer.\n *\n * Allows us to propagate between sibling view states that aren't in the same\n * container. Embedded views already have a node.next, but it is only set for\n * views in the same container. We need a way to link component views and views\n * across containers as well.\n */\n [NEXT]: LView|LContainer|null;\n\n /**\n * Queries active for this view - nodes from a view are reported to those queries.\n */\n [QUERIES]: LQueries|null;\n\n /**\n * Store the `TNode` of the location where the current `LView` is inserted into.\n *\n * Given:\n * ```\n * <div>\n * <ng-template></ng-template>\n * </div>\n * ```\n * We end up with two `TView`s.\n * - `parent` `TView` which contains `<div><!-- anchor --></div>`\n * - `child` `TView` which contains ``\n * Typically the `child` is inserted into the declaration location of the `parent`, but it can be\n * inserted anywhere. Because it can be inserted anywhere it is not possible to store the\n * insertion information in the `TView` and instead we must store it in the `LView[T_HOST]`.\n *\n * So to determine where is our insertion parent we would execute:\n * ```\n * const parentLView = IView[PARENT];\n * const parentTNode = IView[T_HOST];\n * const insertionParent = parentLView[parentTNode.index];\n * ```\n *\n * If `null`, this is the root view of an application (root component is in this view) and it has\n * no parents.\n */\n [T_HOST]: TNode|null;\n\n /**\n * When a view is destroyed, listeners need to be released and outputs need to be\n * unsubscribed. This context array stores both listener functions wrapped with\n * their context and output subscription instances for a particular view.\n *\n * These change per LView instance, so they cannot be stored on

TView. Instead, `TView.cleanup` saves an index to the necessary context in this array. `// TODO: flatten into LView[] [CLEANUP]: any[]|null;` `/** - For dynamic views, this is the context with which to render the template (e.g. `NgForContext`), or `{}` if not defined explicitly. - For root view of the root component the context contains change detection data. - For non-root components, the context is the component instance, - For inline views, the context is null. [CONTEXT]: {}|RootContext|null;` `/** An optional Module Injector to be used as fall back after Element Injectors are consulted. readonly [INJECTOR]: Injector|null;` `/** Factory to be used for creating Renderer. [RENDERER_FACTORY]: RendererFactory3;` `/** Renderer to be used for this view. [RENDERER]: Renderer3;` `/** An optional custom sanitizer. [SANITIZER]: Sanitizer|null;` `/** Reference to the first LView or LContainer beneath this LView in the hierarchy. * Necessary to store this so views can traverse through their nested views to remove listeners and call onDestroy callbacks. [CHILD_HEAD]: LView|LContainer|null;` `/** The last LView or LContainer beneath this LView in the hierarchy. * The tail allows us to quickly add a new state to the end of the view list without having to propagate starting from the first child. [CHILD_TAIL]: LView|LContainer|null;` `/** View where this view's template was declared. * The template for a dynamically created view may be declared in a different view than it is inserted. We already track the "insertion view" (view where the template was inserted) in LView[PARENT], but we also need access to the "declaration view" (view where the template was declared). Otherwise, we wouldn't be able to call the view's template function with the proper contexts. Context should be inherited from the declaration view tree, not the insertion view tree. * Example (AppComponent template): <ng-template #foo></ng-template> <!-- declared here --> <some-comp [tpl]="foo"></some-comp> <!-- inserted inside this component --> The <ng-template> above is declared in the AppComponent template, but it will be passed into SomeComp and inserted there. In this case, the declaration view would be the AppComponent, but the insertion view would be SomeComp. When we are removing views, we would want to traverse through the insertion view to clean up listeners. When we are calling the template function during change detection, we need the declaration view to get inherited context. [DECLARATION_VIEW]: LView|null; /** Points to the declaration component view, used to track transplanted `LView`s. * See: `DECLARATION_VIEW` which points to the actual `LView` where it was declared, whereas `DECLARATION_COMPONENT_VIEW` points to the component which may not be same as `DECLARATION_VIEW`. * Example: <#VIEW #myComp> <div *ngIf="true"> <ng-template #myTpl>...</ng-template> </div> </#VIEW> In the above case `DECLARATION_VIEW` for `myTpl` points to the `LView` of `ngIf` whereas `DECLARATION_COMPONENT_VIEW` points to `LView` of the `myComp` which owns the template. * The reason for this is that all embedded views are always check-always whereas the component view can be check-always or on-push. When we have a transplanted view it is important to determine if we have transplanted a view from check-always declaration to on-push insertion point. In such a case the transplanted view needs to be added to the `LContainer` in the declared `LView` and CD during the declared view CD (in addition to the CD at the insertion point.) (Any transplanted views which are intra Component are of no interest because the CD strategy of declaration and insertion will always be the same, because it is the same component.) * Queries already track moved views in `LView[DECLARATION_LCONTAINER]` and `LContainer[MOVED_VIEWS]`. However the queries also track `LView`s which moved within the same component `LView`. Transplanted views are a subset of moved views, and we use `DECLARATION_COMPONENT_VIEW` to differentiate them. As in this example. * Example showing intra component `LView` movement. <#VIEW #myComp> <div *ngIf="condition; then thenBlock else elseBlock"></div> <ng-template #thenBlock>Content to render when condition is true.</ng-template> <ng-template #elseBlock>Content to render when condition is false.</ng-template> The `thenBlock` and `elseBlock` is moved but not transplanted. * Example showing inter component `LView` movement (transplanted view). <#VIEW #myComp> <ng-template #myTpl>...</ng-template> <insertion-component [template]="myTpl"></insertion-`

```

LView[PREORDER_HOOK_FLAGS]) *^next export const enum PreOrderHookFlags {

/**
 * Stores a set of OpCodes to process
 */
HostBindingsFunction associated with a current view.
In order to invoke HostBindingsFunction we need:
1. 'elementIdx': Index to the element associated with the HostBindingsFunction.
2. 'directiveIdx': Index to the directive associated with the HostBindingsFunction. (This will become the context for the HostBindingsFunction invocation.)
3. 'bindingRootIdx': Location where the bindings for the HostBindingsFunction start. Internally HostBindingsFunction binding indexes start from `0` so we need to add `bindingRootIdx` to it.
4. 'HostBindingsFunction': A host binding function to execute.
The above information needs to be encoded into the HostBindingOpCodes in an efficient manner.
1. 'elementIdx' is encoded into the HostBindingOpCodes as ~elementIdx (so a negative number).
2. 'directiveIdx'
3. 'bindingRootIdx'
4. 'HostBindingsFunction' is passed in as is.
The HostBindingOpCodes array contains:
- negative number to select the element index.
- followed by 1 or more of:
  - a number to select the directive index
  - a number to select the bindingRoot index
  - and a function to invoke.
## Example
const hostBindingOpCodes = [
  ~30, // Select element 30
  40, 45, MyDir.dir.hostBindings // Invoke host bindings on MyDir on element 30
  // directiveIdx = 40; bindingRootIdx = 45;
  50, 55, OtherDir.dir.hostBindings // Invoke host bindings on OtherDir on element 30
  // directiveIdx = 50; bindingRootIdx = 55;
];
/**
 * Pseudocode
 */
const hostBindingOpCodes = tView.hostBindingOpCodes;
if (hostBindingOpCodes === null) return;
for (let i = 0; i < hostBindingOpCodes.length; i++) {
  const opCode = hostBindingOpCodes[i] as number;
  if (opCode < 0) {
    // Negative numbers are element indexes.
    setSelectedIndex(~opCode);
  } else {
    // Positive numbers are NumberTuple which store bindingRootIndex and directiveIndex.
    const directiveIdx = opCode;
    const bindingRootIdx = hostBindingOpCodes[++i] as number;
    const hostBindingFn = hostBindingOpCodes[++i] as HostBindingsFunction<any>;
    setBindingRootForHostBindings(bindingRootIdx, directiveIdx);
    const context = IView[directiveIdx];
    hostBindingFn(RenderFlags.Update, context);
  }
}
}
/**
 * Explicitly marks `TView` as a specific type in `ngDevMode`
 */
It is useful to know conceptually what time of `TView` we are dealing with when debugging an application (even if the runtime does not need it.) For this reason we store this information in the `ngDevMode` `TView` and then use it for better debugging experience.
export const enum TViewType {
  /**
   * Root `TView` is the used to bootstrap components into. It is used in conjunction with `LView` which takes an existing DOM node not owned by Angular and wraps it in `TView`/`LView` so that other components can be loaded into it.
   */
  Root = 0,
  /**
   * `TView` associated with a Component. This would be the `TView` directly associated with the component view (as opposed an `Embedded` `TView` which would be a child of `Component` `TView`)
   */
  Component = 1,
  /**
   * `TView` associated with a template. Such as `*ngIf`, `` etc... A `Component` can have zero or more `Embedded` `TView`s.
   */
  Embedded = 2,
}
/**
 * Converts `TViewType` into human readable text. Make sure this matches with `TViewType`
 */
export const TViewTypeAsString = [
  'Root', // 0
  'Component', // 1
  'Embedded', // 2
] as const;
/**
 * The static data for an LView (shared between all templates of a given type).
 */
Stored on the `ComponentDef.tView`.
export interface TView {
  /**
   * Type of `TView` ('Root'|'Component'|'Embedded').
   */
  type: TViewType;
  /**
   * This is a blueprint used to generate LView instances for this TView. Copying this blueprint is faster than creating a new LView from scratch.
   */
  blueprint: LView;
  /**
   * The template function used to refresh the view of dynamically created views and components. Will be null for inline views.
   */
  template: ComponentTemplate<{}>|null;
  /**
   * A

```

function containing query-related instructions.

- `viewQuery: ViewQueriesFunction<{}>|null;`
- `declTNode: TNode` representing the declaration location of this `TView`` (not part of this `TView``).
- `declTNode: TNode|null;`
- // FIXME(misko): Why does `TView`` not have `declarationTView`` property?
- Whether or not this template has been processed in creation mode.
- `firstCreatePass: boolean;`
- Whether or not this template has been processed in update mode (e.g. change detected)
- `firstUpdatePass`` is used by styling to set up `TData`` to contain metadata about the styling instructions. (Mainly to build up a linked list of styling priority order.)
- Typically this function gets cleared after first execution. If exception is thrown then this flag can remain turned un until there is first successful (no exception) pass. This means that individual styling instructions keep track of if they have already been added to the linked list to prevent double adding.
- `firstUpdatePass: boolean;`
- Static data equivalent of `LView.data[]`. Contains `TNodes`, `PipeDefInternal` or `TI18n`.
- `data: TData;`
- The binding start index is the index at which the data array starts to store bindings only. Saving this value ensures that we will begin reading bindings at the correct point in the array when we are in update mode.
- `bindingStartIndex: number;`
- The index where the "expando" section of `LView`` begins. The expando section contains injectors, directive instances, and host binding values. Unlike the "decls" and "vars" sections of `LView``, the length of this section cannot be calculated at compile-time because directives are matched at runtime to preserve locality.
- We store this start index so we know where to start checking host bindings in `setHostBindings``.
- `expandoStartIndex: number;`
- Whether or not there are any static view queries tracked on this view.
- We store this so we know whether or not we should do a view query refresh after creation mode to collect static query results.
- `staticViewQueries: boolean;`
- Whether or not there are any static content queries tracked on this view.
- We store this so we know whether or not we should do a content query refresh after creation mode to collect static query results.
- `staticContentQueries: boolean;`
- A reference to the first child node located in the view.
- `firstChild: TNode|null;`
- Stores the OpCodes to be replayed during change-detection to process the `HostBindings``
- See `HostBindingOpCodes`` for encoding details.
- `hostBindingOpCodes: HostBindingOpCodes|null;`
- Full registry of directives and components that may be found in this view.
- It's necessary to keep a copy of the full def list on the `TView`` so it's possible to render template functions without a host component.
- `directiveRegistry: DirectiveDefList|null;`
- Full registry of pipes that may be found in this view.
- The property is either an array of `PipeDefs`s` or a function which returns the array of `PipeDefs`s`. The function is necessary to be able to support forward declarations.
- It's necessary to keep a copy of the full def list on the `TView`` so it's possible to render template functions without a host component.
- `pipeRegistry: PipeDefList|null;`
- Array of `ngOnInit`, `ngOnChanges` and `ngDoCheck` hooks that should be executed for this view in creation mode.
- This array has a flat structure and contains `TNode` indices, directive indices (where an instance can be found in `LView``) and hook functions. `TNode` index is followed by the directive index and a hook function. If there are multiple hooks for a given `TNode`, the `TNode` index is not repeated and the next lifecycle hook information is stored right after the previous hook function. This is done so that at runtime the system can efficiently iterate over all of the functions to invoke without having to make any decisions/lookups.
- `preOrderHooks: HookData|null;`
- Array of `ngOnChanges` and `ngDoCheck` hooks that should be executed for this view in update mode.
- This array has the same structure as the `preOrderHooks`` one.
- `preOrderCheckHooks: HookData|null;`
- Array of `ngAfterContentInit` and `ngAfterContentChecked` hooks that should be executed for this view in creation mode.
- Even indices: Directive index
- Odd indices: Hook function
- `contentHooks: HookData|null;`
- Array of `ngAfterContentChecked` hooks that should be executed for this view in update mode.
- Even indices: Directive index
- Odd indices: Hook function
- `contentCheckHooks: HookData|null;`
- Array of `ngAfterViewInit` and `ngAfterViewChecked` hooks that should be executed for this view in creation mode.
- Even indices: Directive index
- Odd indices: Hook function
- `viewHooks: HookData|null;`
- Array of `ngAfterViewChecked` hooks that should be executed for this view in update mode.
- Even indices: Directive index
- Odd indices: Hook

```

```

represents the destroy hooks of a `multi` provider where:

- Even indices represent the index of the provider for which we've registered a destroy hook,
- Odd indices are the destroy hook functions.

For example: `LView: [0, 1, 2, AService, 4, [BService, CService, DService]]`
`destroyHooks: [3, AService.ngOnDestroy, 5, [0, BService.ngOnDestroy, 2, DService.ngOnDestroy]]`

In the example above `AService` is a type provider with an `ngOnDestroy`, whereas `BService`, `CService` and `DService` are part of a `multi` provider where only `BService` and `DService` have an `ngOnDestroy` hook.

`export type DestroyHookData = (HookEntry|HookData)[];`
 Static data that corresponds to the instance-specific data array on an LView.

Each node's static data is stored in `tData` at the same index that it's stored in the data array. Any nodes that do not have static data store a null value in `tData` to avoid a sparse array.

Each pipe's definition is stored here at the same index as its pipe instance in the data array.

Each host property's name is stored here at the same index as its value in the data array.

Each property binding name is stored here at the same index as its value in the data array. If the binding is an interpolation, the static string values are stored parallel to the dynamic values. Example: `id="prefix {{ v0 }} a {{ v1 }} b {{ v2 }} suffix"`

`LView | TView.data` -----
 v0 value | 'a'
 v1 value | 'b'
 v2 value | id prefix suffix

Injector bloom filters are also stored here.

`export type TData = (TNode|PipeDef<any>|DirectiveDef<any>|ComponentDef<any>|number|TStylingRange|TStylingKey|Type<any>|InjectionToken<any>|T18n|I18nUpdateOpCodes|Ticu|null|string)[];`
 Note: This hack is necessary so we don't erroneously get a circular dependency failure based on types.

`const unusedValueExportToPlacateAjd = 1;`

Human readable version of the `LView`.

`LView` is a data structure used internally to keep track of views. The `LView` is designed for efficiency and so at times it is difficult to read or write tests which assert on its values. For this reason when `ngDevMode` is true we patch a `LView.debug` property which points to `LViewDebug` for easier debugging and test writing. It is the intent of `LViewDebug` to be used in tests.`

`export interface LViewDebug {`
 Flags associated with the `LView` unpacked into a more readable state.
 See `LViewFlags` for the flag meanings.

readonly flags: {
 initPhaseState: number,
 creationMode: boolean,
 firstViewPass: boolean,
 checkAlways: boolean,
 dirty: boolean,
 attached: boolean,
 destroyed: boolean,
 isRoot: boolean,
 indexWithinInitPhase: number,
 };

```

import { RNode } from './renderer_dom';
import { LView } from './view';

```

This property will be monkey-patched on elements, components and directives

```

export const MONKEY_PATCH_KEY_NAME = '__ngContext__';

```

The internal view context which is specific to a given DOM element, directive or component instance. Each value in here (besides the LView and element node details) can be present, null or undefined. If undefined then it implies the value has not been looked up yet, otherwise, if null, then a lookup was executed and nothing was found. Each value will get filled when the respective value is examined within the getContext function. The component, element and each directive instance will share the same instance of the context.

```

export interface LContext {
  // The component's parent view data.
  IVIEW: LView;
  // The index instance of the node.
  INDEX: number;
  // The instance of the DOM node that is attached to the LNode.
  NATIVE: RNode;
  // The instance of the Component node.
  COMPONENT: {} | null | undefined;
  // The list of active directives that exist on this element.
  DIRECTIVES: any[] | null | undefined;
  // The map of local references (local reference name => element or directive instance) that exist on this element.
  LOCAL_REFS: {[key: string]: any} | null | undefined;
}

```

The goal here is to make sure that the browser DOM API is the Renderer. We do this by defining a subset of DOM API to be the renderer and then use that at runtime for rendering. At runtime we can then use the DOM api directly, in server or web-worker it will be easy to implement such API.

```

import { RendererStyleFlags2, RendererType2 } from '../render/api_flags';
import { getDocument } from './document';
import { RComment, RElement, RNode, RText } from './renderer_dom';

```

TODO: cleanup once the code is merged in angular/angular

```

export enum RendererStyleFlags3 {
  Important = 1 << 0,
  DashCase = 1 << 1
}
export type Renderer3 = ObjectOrientedRenderer3 | ProceduralRenderer3;
export type GlobalTargetName = 'document' | 'window' | 'body';
export type GlobalTargetResolver = (element: any) => GlobalTargetName;

```

Object Oriented style of API needed to create elements and text nodes. This is the native browser API style, e.g. operations are methods on individual objects like HTML element. With this style, no additional code is needed as a facade (reducing payload size).

```

export interface ObjectOrientedRenderer3 {
  createComment(data: string): RComment;
  createElement(tagName: string): RElement;
  createElementNS(namespace: string, tagName: string): RElement;
  createTextNode(data: string): RText;
  querySelector(selectors: string): RElement | null;
}

```

Returns whether the `renderer` is a `ProceduralRenderer3`

```

function isProceduralRenderer(renderer: ProceduralRenderer3 | ObjectOrientedRenderer3): boolean {
  return !!(renderer as any).listen;
}

```

Procedural style of API needed to create elements and text nodes. In non-native browser environments (e.g. platforms such as web-workers), this is the facade that enables element manipulation. This also facilitates backwards compatibility with Renderer2.

```

export interface ProceduralRenderer3 {
  destroy(): void;
  createComment(value: string): RComment;
  createElement(name: string, namespace?: string | null): RElement;
  createText(value: string): RText;
  // This property is allowed to be null / undefined, in which case the view engine won't call it.
  // This is used as a performance optimization for production mode.
  destroyNode?: ((node: RNode) => void) | null;

This file is used to control if the default rendering pipeline

```

should be `ViewEngine` or `Ivy`. For more information on how to run and debug tests with either Ivy or View Engine (legacy), please see [BAZEL.md](./docs/BAZEL.md).

```

let _devMode: boolean = true;
let _runModeLocked: boolean = false;

Returns whether Angular is in development mode. After called once, the value is locked and won't change any more. By default, this is true, unless a user calls `enableProdMode` before calling this.

@publicApi
export function isDevMode(): boolean {
 _runModeLocked = true;
 return _devMode;
}

Disable Angular's development mode, which turns off assertions and other checks within the framework. One important assertion this disables verifies that a change detection pass does not result in additional changes to any bindings (also known as unidirectional data flow).

@publicApi
export function enableProdMode(): void {
 if (_runModeLocked) {
 throw new Error('Cannot enable prod mode after platform setup.');
```

}
 \_devMode = false;
 }
}

import {trustedHTMLFromString} from './util/security/trusted_types';

This helper is used to get hold of an inert tree of DOM elements containing dirty HTML that needs sanitizing. Depending upon browser support we use one of two strategies for doing this. Default: DOMParser strategy Fallback: InertDocument strategy

export function getInertBodyHelper(defaultDoc: Document): InertBodyHelper {
 return isDOMParserAvailable() ? new DOMParserHelper() : new InertDocumentHelper(defaultDoc);
}

export interface InertBodyHelper {
 /** Get an inert DOM element containing DOM created from the dirty HTML string provided.
 *
 * getInertBodyElement: (html: string) => HTMLElement | null;
 */
 /** Uses DOMParser to create and fill an inert body element. This is the default strategy used in browsers that support it.
 *
 * class DOMParserHelper implements InertBodyHelper {
 * getInertBodyElement(html: string):
 * HTMLElement|null {
 * // We add these extra elements to ensure that the rest of the content is parsed as expected
 * // e.g. leading whitespace is maintained and tags like <meta> do not get hoisted to the <head> tag. Note that the <body> tag is closed implicitly to prevent unclosed tags
 * // in `html` from consuming the otherwise explicit </body> tag.
 * html = '<body><remove></remove>' + html;
 * try {
 * const body = new window.DOMParser().parseFromString(trustedHTMLFromString(html) as string, 'text/html');
 * .body as HTMLBodyElement;
 * body.removeChild(body.firstChild!);
 * return body;
 * } catch {
 * return null;
 * }
 * }
 * }

 * Use an HTML5 `template` element, if supported, or an inert body element created via `createHtmlDocument` to create and fill an inert DOM element. This is the fallback strategy if the browser does not support DOMParser.

 * class InertDocumentHelper implements InertBodyHelper {
 * private inertDocument: Document;
 * constructor(private defaultDoc: Document) {
 * this.inertDocument = this.defaultDoc.implementation.createHTMLDocument('sanitization-inert');
 * if (this.inertDocument.body == null) {
 * // usually there should be only one body element in the document, but IE doesn't have any, so we need to create one.
 * const inertHtml = this.inertDocument.createElement('html');
 * this.inertDocument.appendChild(inertHtml);
 * const inertBodyElement = this.inertDocument.createElement('body');
 * inertHtml.appendChild(inertBodyElement);
 * }
 * }

 * getInertBodyElement(html: string): HTMLElement|null {
 * // Prefer using <template> element if supported.
 * const templateEl = this.inertDocument.createElement('template');
 * if ('content' in templateEl) {
 * templateEl.innerHTML = trustedHTMLFromString(html) as string;
 * return templateEl;
 * }
 * // Note that previously we used to do something like `this.inertDocument.body.innerHTML = html` and we returned the inert `body` node. This was changed, because IE seems to treat setting `innerHTML` on an inserted element differently, compared to one that hasn't been inserted yet. In particular, IE appears to split some of the text into multiple text nodes rather than keeping them in a single one which ends up messing with Ivy's i18n parsing further down the line. This has been worked around by creating a new inert `body` and using it as the root node in which we insert the HTML.
 * const inertBody = this.inertDocument.createElement('body');
 * inertBody.innerHTML = trustedHTMLFromString(html) as string;
 * // Support: IE 11 only
 * // strip custom-namespaced attributes on IE<=11
 * if ((this.defaultDoc as any).documentMode) {
 * this.stripCustomNsAttrs(inertBody);
 * }
 * return inertBody;
 * }
 * }

 * When IE11 comes across an

```

unknown namespaced attribute e.g. 'xlink:foo' it adds 'xmlns:ns1' attribute to declare ns1 namespace and prefixes the attribute with 'ns1' (e.g. 'ns1:xlink:foo'). This is undesirable since we don't want to allow any of these custom attributes. This method strips them all.

```

private stripCustomNsAttrs(el: Element) {
 const elAttrs = el.attributes;
 // loop backwards so that we can support removals.
 for (let i = elAttrs.length - 1; 0 < i; i--) {
 const attrib = elAttrs.item(i);
 const attrName = attrib!.name;
 if (attrName === 'xmlns:ns1' || attrName.indexOf('ns1:') === 0) {
 el.removeAttribute(attrName);
 }
 }
 let childNode = el.firstChild as Node | null;
 while (childNode) {
 if (childNode.nodeType === Node.ELEMENT_NODE) this.stripCustomNsAttrs(childNode as Element);
 childNode = childNode.nextSibling;
 }
}

```

We need to determine whether the DOMParser exists in the global context and supports parsing HTML; HTML parsing support is not as wide as other formats, see [https://developer.mozilla.org/en-US/docs/Web/API/DOMParser#Browser\\_compatibility](https://developer.mozilla.org/en-US/docs/Web/API/DOMParser#Browser_compatibility).

```

@suppress {uselessCode}
export function isDOMParserAvailable() {
 try {
 return !!new window.DOMParser().parseFromString(
 trustedHTMLFromString("") as string, 'text/html');
 } catch {}
 return false;
}

```

A pattern that recognizes a commonly useful subset of URLs that are safe. This regular expression matches a subset of URLs that will not cause script execution if used in URL context within a HTML document. Specifically, this regular expression matches if (comment from here on and regex copied from Soy's EscapingConventions):

- (1) Either an allowed protocol (http, https, mailto or ftp).
- (2) or no protocol. A protocol must be followed by a colon. The below allows that by allowing colons only after one of the characters [/?#]. A colon after a hash (#) must be in the fragment. Otherwise, a colon after a (?) must be in a query. Otherwise, a colon after a single solidus (/) must be in a path. Otherwise, a colon after a double solidus (//) must be in the authority (before port).

The pattern disallows &, used in HTML entity declarations before one of the characters in [/?#]. This disallows HTML entities used in the protocol name, which should never happen, e.g. "h&#116;tp" for "http". It also disallows HTML entities in the first path part of a relative path, e.g. "foo&lt;bar/baz". Our existing escaping functions should not produce that. More importantly, it disallows masking of a colon, e.g. "javascript&#58;...".

This regular expression was taken from the Closure sanitization library.

```

const SAFE_URL_PATTERN = /^(?:(?:https?|mailto|ftp|tel|file|sms):|[^&:/?#]*(?:/?.#)?)$/gi;
const SAFE_SRCSET_PATTERN = /^(?:(?:https?|file):|[^&:/?#]*(?:/?.#)?)$/gi;
const DATA_URL_PATTERN = /^data:(?:image\/(?:bmp|gif|jpeg|jpg|png|tiff|webp)|video\/(?:mpeg|mp4|ogg|webm)|audio\/(?:mp3|oga|ogg|opus));base64,[a-z0-9+\\\/]+=*$/i;

```

```

export function _sanitizeUrl(url: string): string {
 url = String(url);
 if (url.match(SAFE_URL_PATTERN) || url.match(DATA_URL_PATTERN)) return url;
 if (isDevMode()) {
 console.warn(`WARNING: sanitizing unsafe URL value ${url} (see http://g.co/ng/security#xss)`);
 }
 return 'unsafe:' + url;
}
export function sanitizeSrcset(srcset: string): string {
 srcset = String(srcset);
 return srcset.split(',').map(srcset => _sanitizeUrl(srcset.trim())).join(', ');
}

2 constraints.\n * 1. Init hooks (ngOnInit, ngAfterContentInit, ngAfterViewInit) must all be executed once and
only\n * once, across many change detection cycles. This must be true even if some hooks throw, or if\n * some
recursively trigger a change detection cycle.\n * To solve that, it is required to track the state of the execution of
these init hooks.\n * This is done by storing and maintaining flags in the view: the {@link InitPhaseState},\n * and
the index within that phase. They can be seen as a cursor in the following structure:\n * [[onInit1, onInit2],
[afterContentInit1], [afterViewInit1, afterViewInit2, afterViewInit3]]\n * They are stored as flags in

```

LView[FLAGS].\n *\n * 2. Pre-order hooks can be executed in batches, because of the select instruction.\n * To be able to pause and resume their execution, we also need some state about the hook's array\n * that is being processed:\n * - the index of the next hook to be executed\n * - the number of init hooks already found in the processed part of the array\n * They are stored as flags in LView[PREORDER_HOOK_FLAGS].\n *\n *\n *\n * Executes pre-order check hooks (OnChanges, DoChanges) given a view where all the init hooks were\n * executed once. Offsets of the `NodeInjector` data structure in the expando.\n * \n * `NodeInjector` is stored in both `LView` as well
as `TView.data`. All storage requires 9 words.\n * First 8 are reserved for bloom filter and the 9th is reserved for the
associated `TNode` as well\n * as parent `NodeInjector` pointer. All indexes are starting with `index` and have an
offset as\n * shown.\n * \n * `LView` layout:\n * ```\n * index + 0: cumulative bloom filter\n * index + 1: cumulative
bloom filter\n * index + 2: cumulative bloom filter\n * index + 3: cumulative bloom filter\n * index + 4: cumulative
bloom filter\n * index + 5: cumulative bloom filter\n * index + 6: cumulative bloom filter\n * index + 7: cumulative
bloom filter\n * index + 8: cumulative bloom filter\n * index + PARENT: Index to the parent injector. See
`RelativeInjectorLocation`\n *
`const parent = lView[index + NodeInjectorOffset.PARENT]`\n * ```\n * \n * `TViewData` layout:\n * ```\n * index + 0: cumulative bloom filter\n * index + 1: cumulative bloom filter\n *
index + 2: cumulative bloom filter\n * index + 3: cumulative bloom filter\n * index + 4: cumulative bloom filter\n *
index + 5: cumulative bloom filter\n * index + 6: cumulative bloom filter\n * index + 7: cumulative bloom filter\n *
index + 8: cumulative bloom filter\n * index + TNode: TNode associated with this `NodeInjector`\n *
`const tNode = tView.data[index + NodeInjectorOffset.TNODE]`\n * ```\n *^\nexport const enum
NodeInjectorOffset {\n  TNode = 8,\n  PARENT = 8,\n  BLOOM_SIZE = 8,\n  SIZE = 9,\n}\n\n/**\n * Represents
a relative location of parent injector.\n * \n * The interfaces encodes number of parents `LView`s to traverse and
index in the `LView`\n * pointing to the parent injector.\n *^\nexport interface RelativeInjectorLocation {\n
  __brand__: 'RelativeInjectorLocationFlags';\n}\n\nexport const enum RelativeInjectorLocationFlags {\n
  InjectorIndexMask = 0b1111111111111111,\n  ViewOffsetShift = 16,\n  NO_PARENT = -1,\n}\n\nexport const
NO_PARENT_INJECTOR: RelativeInjectorLocation = -1 as any;\n\n/**\n * Each injector is saved in 9 contiguous
slots in `LView` and 9 contiguous slots in\n * `TView.data`. This allows us to store information about the current
node's tokens (which\n * can be shared in `TView`) as well as the tokens of its ancestor nodes (which cannot be\n *
shared, so they live in `LView`).\n * \n * Each of these slots (aside from the last slot) contains a bloom filter. This
bloom filter\n * determines whether a directive is available on the associated node or not. This prevents us\n * from
searching the directives array at this level unless it's probable the directive is in it.\n * \n * See:
https://en.wikipedia.org/wiki/Bloom\_filter for more about bloom filters.\n * \n * Because all injectors have been
flattened into `LView` and `TViewData`, they cannot typed\n * using interfaces as they were previously. The start
index of each `LInjector` and `TInjector`\n * will differ based on where it is flattened into the main array, so it's not
possible to know\n * the indices ahead of time and save their types here. The interfaces are still included here\n * for
documentation purposes.\n * \n * export interface LInjector extends Array<any> {\n * \n * // Cumulative bloom for
directive IDs 0-31 (IDs are % BLOOM_SIZE)\n * [0]: number;\n * \n * // Cumulative bloom for directive IDs
32-63\n * [1]: number;\n * \n * // Cumulative bloom for directive IDs 64-95\n * [2]: number;\n * \n * //
Cumulative bloom for directive IDs 96-127\n * [3]: number;\n * \n * // Cumulative bloom for directive IDs 128-
159\n * [4]: number;\n * \n * // Cumulative bloom for directive IDs 160 - 191\n * [5]: number;\n * \n * //

Needed for `viewProviders` and `providers` merging.\n * // **\n * See `providerFactory`.\n * // **\n * index?: number;\n * // **\n * Because the same `multi` provider can be declared in `provides` and `viewProvides` it is\n * // **\n * possible for `viewProvides` to shadow the `provides`. For this reason we store the\n * // **\n * `provideFactory` of the `providers` so that `providers` can be extended with `viewProviders`.\n * // **\n * Example:\n * // **\n * Given:\n * // **\n * provides: [{provide: String, useValue: 'all', multi: true}],\n * // **\n * viewProvides: [{provide: String, useValue: 'viewOnly', multi: true}],\n * // **\n * We have to return `[all]` in case of content injection, but `[all, 'viewOnly']` in case\n * // **\n * of view injection. We further have to make sure that the shared instances (in our case\n * // **\n * `all`) are the exact same instance in both the content as well as the view injection. (We\n * // **\n * have to make sure that we don't double instantiate.) For this reason the `viewProvides`\n * // **\n * `Factory` has a pointer to the shadowed `provides` factory so that it can instantiate the\n * // **\n * `providers` (`[all]`) and then extend it with `viewProviders` (`[all] + ['viewOnly']`).\n * // **\n * providerFactory?: NodeInjectorFactory|null;\n * // **\n * constructor(\n * // **\n * Factory to invoke in order to create a new instance.\n * // **\n * public factory:\n * // **\n * (this: NodeInjectorFactory, _: undefined,\n * // **\n * * array where injectables tokens are stored. This is used in\n * // **\n * * case of an error reporting to produce friendlier errors.\n * // **\n * tData: TData,\n * // **\n * * array where existing instances of injectables are stored. This is used in case\n * // **\n * * of multi shadow is needed. See `multi` field documentation.\n * // **\n * IView: LView,\n * // **\n * * The

This bit is set if the node has been detached by `i18n.isDetached = 0x40`. Bit #8 - This bit is set if the node has directives with host bindings. This flag allows us to guard host-binding logic and invoke it only on nodes that actually have directives with host bindings. `hasHostBindings = 0x80`. Corresponds to the `TNode.providerIndexes` property. `export const enum TNodeProviderIndexes` The index of the first provider on this node is encoded on the least significant bits. `ProvidersStartIndexMask = 0b00000000000011111111111111111111`. The count of view providers from the component on this node is encoded on the 20 most significant bits. `CptViewProvidersCountShift = 20`, `CptViewProvidersCountShifter = 0b00000000000100000000000000000000`. A set of marker values to be used in the attributes arrays. These markers indicate that some items are not regular attributes and the processing should be adapted accordingly. `export const enum AttributeMarker` An implicit marker which indicates that the value in the array are of ``attributeKey`, `attributeValue`` format. NOTE: This is implicit as it is the type when no marker is present in array. We indicate that it should not be present at runtime by the negative number. `ImplicitAttributes = -1`. Marker indicates that the following 3 values in the attributes array are: `namespaceUri, attributeName, attributeValue` in that order. `NamespaceURI = 0`. Signals class declaration. Each value following ``Classes`` designates a class name to include on the element. ## Example: Given: `<div class="foo bar baz">...</div>` the generated code is: `var _c1 = [AttributeMarker.Classes, 'foo', 'bar', 'baz'];` `Classes = 1`. Signals style declaration. Each pair of values following ``Styles`` designates a style name and value to include on the element. ## Example: Given: `<div style="width:100px; height:200px; color:red">...</div>` the generated code is: `var _c1 = [AttributeMarker.Styles, 'width', '100px', 'height', '200px', 'color', 'red'];` `Styles = 2`. Signals that the following attribute names were extracted from input or output bindings. For example, given the following HTML: `<div moo="car" [foo]="exp" (bar)="doSth()">` the generated code is: `var _c1 = ['moo', 'car', AttributeMarker.Bindings, 'foo', 'bar'];` `Bindings = 3`. Signals that the following attribute names were hoisted from an inline-template declaration. For example, given the following HTML: `<div *ngFor="let value of values; trackBy:trackBy" dirA [dirB]="value">` the generated code for the ``template()`` instruction would include: `['dirA', "", AttributeMarker.Bindings, 'dirB', AttributeMarker.Template, 'ngFor', 'ngForOf', 'ngForTrackBy', 'let-value']` while the generated code for the ``element()`` instruction inside the template function would include: `['dirA', "", AttributeMarker.Bindings, 'dirB']` `Template = 4`. Signals that the following attribute is ``ngProjectAs`` and its value is a parsed ``CssSelector``. For example, given the following HTML: `<h1 attr="value" ngProjectAs="[title]">` the generated code for the ``element()`` instruction would include: `['attr', 'value', AttributeMarker.ProjectAs, '[', 'title', '']` `ProjectAs = 5`. Signals that the following attribute will be translated by runtime `i18n`. For example, given the following HTML: `<div moo="car" foo="value" i18n-foo [bar]="binding" i18n-bar>` the generated code is: `var _c1 = ['moo', 'car', AttributeMarker.I18n, 'foo', 'bar'];` `I18n = 6`. A combination of: `- Attribute names and values`, `- Special markers acting as flags to alter attributes processing`, `- Parsed ngProjectAs selectors`. `export type TAttributes = (string|AttributeMarker|CssSelector)[];` Constants that are associated with a view. Includes: `- Attribute arrays`, `- Local definition arrays`, `- Translated messages (i18n)`. `export type TConstants = (TAttributes|string)[];` Factory function that returns an array of consts. Consts can be represented as a function in case any additional statements are required to define consts in the list. An example is `i18n` where additional `i18n` calls are generated, which should be executed when consts are requested for the first time. `export type TConstantsFactory = () => TConstants;` `TConstants` type that describes how the ``consts`` field is generated on `ComponentDef`: it can be either an array or a factory function that returns that array. `export type TConstantsOrFactory = TConstants|TConstantsFactory;` Binding data (flyweight) for a

particular node that is shared between all templates of a specific type. If a property is:

- PropertyAliases: that property's data was generated and this is it
- Null: that property's data was already generated and nothing was found
- Undefined: that property's data has not yet been generated

see: https://en.wikipedia.org/wiki/Flyweight_pattern for more on the Flyweight pattern

```

export interface TNode {
  /** The type of the TNode. See TNodeType. */
  type: TNodeType;
  /** Index of the TNode in TView.data and corresponding native element in LView. This is necessary to get from any TNode to its corresponding native element when traversing the node tree. If index is -1, this is a dynamically created container node or embedded view node. */
  index: number;
  /** Insert before existing DOM node index. When DOM nodes are being inserted, normally they are being appended as they are created. Under i18n case, the translated text nodes are created ahead of time as part of the `i18nStart` instruction which means that this `TNode` can't just be appended and instead needs to be inserted using `insertBeforeIndex` semantics. Additionally sometimes it is necessary to insert new text nodes as a child of this `TNode`. In such a case the value stores an array of text nodes to insert. Example:
  * <div i18n> Hello <span>World</span>! </div>
  * In the above example the `i18nStart` instruction can create `Hello`, `World` and `!` text nodes. It can also insert `Hello` and `!` text node as a child of `<div>`, but it can't insert `World` because the `<span>` node has not yet been created. In such a case the `<span>` `TNode` will have an array which will direct the `<span>` to not only insert itself in front of `!` but also to insert the `World` (created by `i18nStart`) into `<span>` itself.
  * Pseudo code:
  * if (insertBeforeIndex === null) {
  *   // append as normal
  * } else if (Array.isArray(insertBeforeIndex)) {
  *   // First insert current `TNode` at correct location
  *   const currentNode = IView[this.index];
  *   parentNode.insertBefore(currentNode, IView[this.insertBeforeIndex[0]]);
  *   // Now append all of the children
  *   for(let i=1; i<this.insertBeforeIndex; i++) {
  *     currentNode.appendChild(IView[this.insertBeforeIndex[i]]);
  *   } else {
  *     parentNode.insertBefore(IView[this.index], IView[this.insertBeforeIndex])
  *   }
  * }
  * - null: Append as normal using `parentNode.appendChild`
  * - `number`: Append using `parentNode.insertBefore(IView[this.index], IView[this.insertBeforeIndex])`
  * *Initialization*
  * Because `i18nStart` executes before nodes are created, on `TView.firstCreatePass` it is not possible for `i18nStart` to set the `insertBeforeIndex` value as the corresponding `TNode` has not yet been created. For this reason the `i18nStart` creates a `TNodeType.Placeholder` `TNode` at that location. See `TNodeType.Placeholder` for more information.
  * insertBeforeIndex: InsertBeforeIndex;
  * The index of the closest injector in this node's LView.
  * If the index === -1, there is no injector on this node or any ancestor node in this view.
  * If the index !== -1, it is the index of this node's injector OR the index of a parent injector in the same view. We pass the parent injector index down the node tree of a view so it's possible to find the parent injector without walking a potentially deep node tree.
  * Injector indices are not set across view boundaries because there could be multiple component hosts.
  * If tNode.injectorIndex === tNode.parent.injectorIndex, then the index belongs to a parent injector.
  * injectorIndex: number;
  /** Stores starting index of the directives.
  * NOTE: The first directive is always component (if present).
  * directiveStart: number;
  /** Stores final exclusive index of the directives.
  * The area right behind the `directiveStart-directiveEnd` range is used to allocate the `HostBindingFunction` `vars` (or null if no bindings.) Therefore `directiveEnd` is used to set `LFrame.bindingRootIndex` before `HostBindingFunction` is executed.
  * directiveEnd: number;
  /** Stores the last directive which had a styling instruction.
  * Initial value of this is -1 which means that no `hostBindings` styling instruction has executed. As `hostBindings` instructions execute they set the value to the index of the `DirectiveDef` which contained the last `hostBindings` styling instruction.
  * Valid values are:
  * - -1: No `hostBindings` instruction has executed.
  * - `directiveStart <= directiveStylingLast < directiveEnd`: Points to the `DirectiveDef` of the last styling instruction which executed in the `hostBindings`.
  * This data is needed so that styling instructions know which static styling data needs to be collected from the `DirectiveDef.hostAttrs`. A styling instruction needs to collect all data since last styling instruction.
  * directiveStylingLast: number;
  */
}

```

```

projected sibling. Since in Angular content projection works on the node-by-node\n * basis the act of projecting
nodes might change nodes relationship at the insertion point\n * (target view). At the same time we need to keep
initial relationship between nodes as\n * expressed in content view.\n */\n projectionNext: TNode|null;\n\n /**\n
* First child of the current node.\n *\n * For component nodes, the child will always be a ContentChild (in same
view).\n * For embedded view nodes, the child will be in their child view.\n */\n child: TNode|null;\n\n /**\n
* Parent node (in the same view only).\n *\n * We need a reference to a node's parent so we can append the node to

```

its parent's native element at the appropriate time. If the parent would be in a different view (e.g. component host), this property will be null. It's important that we don't try to cross component boundaries when retrieving the parent because the parent will change (e.g. index, attrs) depending on where the component was used (and thus shouldn't be stored on TNode). In these cases, we retrieve the parent through LView.node instead (which will be instance-specific). If this is an inline view node (V), the parent will be its container. parent: TElementNode|TContainerNode|null; List of projected TNodes for a given component host element OR index into the said nodes. For easier discussion assume this example: <parent>'s view definition: <child id="c1">content1</child> <child id="c2">content2</child> <child>'s view definition: <ng-content id="cont1"></ng-content> If Array.isArray(projection) then TNode is a host element: projection stores the content nodes which are to be projected. The nodes represent categories defined by the selector: For example: <ng-content/><ng-content select="abc"/> would represent the heads for <ng-content/> and <ng-content select="abc"/> respectively. The nodes we store in projection are heads only, we used .next to get their siblings. The nodes .next is sorted/rewritten as part of the projection setup. projection size is equal to the number of projections <ng-content>. The size of c1 will be 1 because <child> has only one <ng-content>. we store projection with the host (c1, c2) rather than the <ng-content> (cont1) because the same component (<child>) can be used in multiple locations (c1, c2) and as a result have different set of nodes to project. without projection it would be difficult to efficiently traverse nodes to be projected. If typeof projection == 'number' then TNode is a <ng-content> element: projection is an index of the host's projection.Nodes. This would return the first head node to project: getHost(currentTNode).projection[currentTNode.projection]. When projecting nodes the parent node retrieved may be a <ng-content> node, in which case the process is recursive in nature. If projection is of type RNode[][] then we have a collection of native nodes passed as projectable nodes during dynamic component creation. projection: (TNode|RNode[]|number|null); A collection of all style static values for an element (including from host). This field will be populated if and when: There are one or more initial style's on an element (e.g. <div style="width:200px;">) There are one or more initial style's on a directive/component host (e.g. @Directive({host: {style: "width:200px;" } })); styles: string|null; A collection of all style static values for an element excluding host sources. Populated when there are one or more initial style's on an element (e.g. <div style="width:200px;">) Must be stored separately from tNode.styles to facilitate setting directive inputs that shadow the style property. If we used tNode.styles as is for shadowed inputs, we would feed host styles back into directives as "inputs". If we used tNode.attrs, we would have to concatenate the attributes on every template pass. Instead, we process once on first create pass and store here. stylesWithoutHost: string|null; A KeyValueArray version of residual styles. When there are styling instructions than each instruction stores the static styling which is of lower priority than itself. This means that there may be a higher priority styling than the instruction. Imagine: <div style="color: highest;" my-dir> @Directive({host: {style: 'color: lowest;', [styles.color]: 'exp' // styleProp('color', ctx.exp); }}) In the above case: color: lowest is stored with styleProp('color', ctx.exp); instruction color: highest is the residual and is stored here. undefined: not initialized. null: initialized but styles is null - KeyValueArray: parsed version of styles residualStyles: KeyValueArray<any>|undefined|null; A collection of all class static values for an element (including from host). This field will be populated if and when: There are one or more initial classes on an element (e.g. <div class="one two three">) There are one or more initial classes on a directive/component host (e.g. @Directive({host: {class: "SOME_CLASS" } })); classes: string|null; A collection of all class static values for an element excluding host sources. Populated when there are one or more initial classes on an element (e.g. <div class="SOME_CLASS">) Must be stored separately from tNode.classes to facilitate setting directive inputs that shadow the class

property. If we used `tNode.classes` as is for shadowed inputs, we would feed host classes back into directives as `inputs`. If we used `tNode.attrs`, we would have to concatenate the attributes on every template pass. Instead, we process once on first create pass and store here.

```

classWithoutHost: string|null;
A `KeyValueArray` version of residual `classes`. Same as `TNode.residualStyles` but for classes.
- `undefined`: not initialized.
- `null`: initialized but `classes` is `null`
- `KeyValueArray`: parsed version of `classes`
residualClasses: KeyValueArray<any>|undefined|null;
Stores the head/tail index of the class bindings.
- If no bindings, the head and tail will both be 0.
- If there are template bindings, stores the head/tail of the class bindings in the template.
- If no template bindings but there are host bindings, the head value will point to the last host binding for `class` (not the head of the linked list), tail will be 0.
See: `style_binding_list.ts` for details.
This is used by `insertTStylingBinding` to know where the next styling binding should be inserted so that they can be sorted in priority order.
classBindings: TStylingRange;
Stores the head/tail index of the class bindings.
- If no bindings, the head and tail will both be 0.
- If there are template bindings, stores the head/tail of the style bindings in the template.
- If no template bindings but there are host bindings, the head value will point to the last host binding for `style` (not the head of the linked list), tail will be 0.
See: `style_binding_list.ts` for details.
This is used by `insertTStylingBinding` to know where the next styling binding should be inserted so that they can be sorted in priority order.
styleBindings: TStylingRange;
See `TNode.insertBeforeIndex`
export type InsertBeforeIndex = null|number|number[];
Static data for an element
export interface TElementNode extends TNode {
  Index in the data[] array
  index: number;
  child: TElementNode|TTextNode|TElementContainerNode|TContainerNode|TProjectionNode|null;
  Element nodes will have parents unless they are the first node of a component or embedded view (which means their parent is in a different view and must be retrieved using viewData[HOST_NODE]).
  parent: TElementNode|TElementContainerNode|null;
  tViews: null;
  If this is a component TNode with projection, this will be an array of projected TNodes or native nodes (see TNode.projection for more info). If it's a regular element node or a component without projection, it will be null.
  projection: (TNode|RNode[]|null);
  Stores tagName
  value: string;
  Static data for a text node
  export interface TTextNode extends TNode {
    Index in the data[] array
    index: number;
    child: null;
    Text nodes will have parents unless they are the first node of a component or embedded view (which means their parent is in a different view and must be retrieved using LView.node).
    parent: TElementNode|TElementContainerNode|null;
    tViews: null;
    projection: null;
  }
  Static data for an LContainer
  export interface TContainerNode extends TNode {
    Index in the data[] array.
    If it's -1, this is a dynamically created container node that isn't stored in data[] (e.g. when you inject ViewContainerRef).
    index: number;
    child: null;
    Container nodes will have parents unless:
    - They are the first node of a component or embedded view
    - They are dynamically created
    parent: TElementNode|TElementContainerNode|null;
    tViews: TView|TView[]|null;
    projection: null;
    value: null;
  }
  Static data for an <ng-container>
  export interface TElementContainerNode extends TNode {
    Index in the LView[] array.
    index: number;
    child: TElementNode|TTextNode|TContainerNode|TElementContainerNode|TProjectionNode|null;
    parent: TElementNode|TElementContainerNode|null;
    tViews: null;
    projection: null;
  }
  Static data for an ICU expression
  export interface TIcuContainerNode extends TNode {
    Index in the LView[] array.
    index: number;
    child: null;
    parent: TElementNode|TElementContainerNode|null;
    tViews: null;
    projection: null;
    value: TIcon;
  }
  Static data for an LProjectionNode
  export interface TProjectionNode extends TNode {
    Index in the data[] array
    child: null;
    Projection nodes will have parents unless they are the first node of a component or embedded view (which means their parent is in a different view and must be retrieved using LView.node).
    parent: TElementNode|TElementContainerNode|null;
    tViews: null;
    Index of the projection node. (See TNode.projection for more info.)
    projection: number;
    value: null;
  }
  A union type representing all TNode types that can host a directive.
  export type

```

```

TDirectiveHostNode = TElementNode|TContainerNode|TElementContainerNode;

// This mapping is necessary so we can set input properties and output listeners properly at runtime when property names are minified or aliased.
// Key: unminified / public input or output name
// Value: array containing minified / internal name and related directive index
// The value must be an array to support inputs and outputs with the same name on the same node.
export type PropertyAliases = {
  // This uses an object map because using the Map type would be too slow
  [key: string]: PropertyAliasValue;
};

// Store the runtime input or output names for all the directives.
// i+0: directive instance index
// i+1: privateName
// e.g. [0, 'change-minified']
export type PropertyAliasValue = (number|string)[];

// This array contains information about input properties that need to be set once from attribute data. It's ordered by directive index (relative to element) so it's simple to look up a specific directive's initial input data.
// Within each sub-array:
// i+0: attribute name
// i+1: minified/internal input name
// i+2: initial value
// If a directive on a node does not have any input properties that should be set from attributes, its index is set to null to avoid a sparse array.
// e.g. [null, ['role-min', 'minified-input', 'button']]
export type InitialInputData = (InitialInputs|null)[];

// Used by InitialInputData to store input properties that should be set once from attributes.
// i+0: attribute name
// i+1: minified/internal input name
// i+2: initial value
// e.g. ['role-min', 'minified-input', 'button']

list of `CssSelectors`.  
 A directive or component can have multiple selectors. This type is used for directive defs so any of the selectors in the list will match that directive.  
 Original: 'form, [ngForm]'  
 Parsed: ['form'], ['ngForm', '']  
 export type `CssSelectorList` = `CssSelector`[];  
 List of slots for a projection. A slot can be either based on a parsed CSS selector which will be used to determine nodes which are projected into that slot.  
 When set to `'*'`, the slot is reserved and can be used for multi-slot projection using `{ @link ViewContainerRef#createComponent }`. The last slot that specifies the wildcard selector will retrieve all projectable nodes which do not match any selector.  
 export type `ProjectionSlots` = (`CssSelectorList` | '\*')[];  
 Flags used to build up `CssSelectors`  
 export const enum `SelectorFlags` {  
 /\*\* Indicates this is the beginning of a new negative selector \*/  
 NOT = 0b0001,  
 /\*\* Mode for matching attributes \*/  
 ATTRIBUTE = 0b0010,  
 /\*\* Mode for matching tag names \*/  
 ELEMENT = 0b0100,  
 /\*\* Mode for matching class names \*/  
 CLASS = 0b1000,  
 }  
 Note: This hack is necessary so we don't erroneously get a circular dependency failure based on types.

assertNumberInRange } from '../util/assert';\n\n/**\n * Value stored in the `TData` which is needed to re-
concatenate the styling.\n *\n * See: `TStylingKeyPrimitive` and `TStylingStatic`\n *\nexport type TStylingKey =
TStylingKeyPrimitive|TStylingStatic;\n\n\n/**\n * The primitive portion (`TStylingStatic` removed) of the value
stored in the `TData` which is\n * needed to re-concatenate the styling.\n *\n * - `string`: Stores the property name.
Used with `styleProp`/`classProp` instruction.\n * - `null`: Represents map, so there is no name. Used with
`styleMap`/`classMap`\n * - `false`: Represents an ignore case. This happens when `styleProp`/`classProp`
instruction\n * is combined with directive which shadows its input `@Input('class')`. That way the binding\n *
should not participate in the styling resolution.\n *\nexport type TStylingKeyPrimitive = string|null|false;\n\n\n/**\n * Store the static values for the styling binding.\n *\n * The `TStylingStatic` is just `KeyValueArray` where key `""`
(stored at location 0) contains the\n * `TStylingKey` (stored at location 1). In other words this wraps the
`TStylingKey` such that the\n * `""` contains the wrapped value.\n *\n * When instructions are resolving styling
they may need to look forward or backwards in the linked\n * list to resolve the value. For this reason we have to
make sure that the linked list also contains\n * the static values. However the list only has space for one item per
styling instruction. For this\n * reason we store the static values here as part of the `TStylingKey`. This means that
the\n * resolution function when looking for a value needs to first look at the binding value, and then\n * at
`TStylingKey` (if it exists).\n *\n * Imagine we have:\n *\n * ``\n * <div class="TEMPLATE" my-dir>\n *\n * @Directive({\n * host: {\n * class: 'DIR',\n * [class.dynamic]: 'exp' // classProp('dynamic', ctx.exp);\n * }\n * })\n *\n * In the above case the linked list will contain one item:\n *\n * ``\n * // assume binding location:
10 for `classProp('dynamic', ctx.exp)`;\n * tData[10] = <TStylingStatic>[\n * "": 'dynamic', // This is the wrapped
value of `TStylingKey`\n * 'DIR': true, // This is the default static value of directive binding.\n *];\n *
tData[10 + 1] = 0; // We don't have prev/next.\n *\n * lView[10] = undefined; // assume `ctx.exp` is
`undefined`\n *\n * lView[10 + 1] = undefined; // Just normalized `lView[10]`\n *\n * So when the function is
resolving styling value, it first needs to look into the linked list\n * (there is none) and then into the static
`TStylingStatic` too see if there is a default value for\n * `dynamic` (there is not). Therefore it is safe to remove it.\n
*\n * If setting `true` case:\n *\n * ``\n * lView[10] = true; // assume `ctx.exp` is `true`\n * lView[10 + 1] = true; //
Just normalized `lView[10]`\n *\n * So when the function is resolving styling value, it first needs to look into the
linked list\n * (there is none) and then into `TNode.residualClass` (TNode.residualStyle) which contains\n *\n * ``\n *
tNode.residualClass = [\n * 'TEMPLATE': true,\n *];\n *\n * This means that it is safe to add class.\n
*\nexport interface TStylingStatic extends KeyValueArray<any> {} \n\n\n/**\n * This is a branded number which
contains previous and next index.\n *\n * When we come across styling instructions we need to store the
`TStylingKey` in the correct\n * order so that we can re-concatenate the styling value in the desired priority.\n
*\n

```

The insertion can happen either at the end of template as in the case of coming across additional styling instruction in the template or in front of the template in the case of coming across additional instruction in the hostBindings. We use TStylingRange to store the previous and next index into the TData where the template bindings can be found. bit 0 is used to mark that the previous index has a duplicate for current value. bit 1 is used to mark that the next index has a duplicate for the current value. bits 2-16 are used to encode the next/tail of the template. bits 17-32 are used to encode the previous/head of template.

NOTE: \*duplicate\* false implies that it is statically known that this binding will not collide with other bindings and therefore there is no need to check other bindings. For example the bindings in `<div [style.color]=\"exp\" [style.width]=\"exp\">` will never collide and will have their bits set accordingly. Previous duplicate means that we may need to check previous if the current binding is `null`. Next duplicate means that we may need to check next bindings if the current binding is not `null`.

NOTE: `0` has special significance and represents `null` as in no additional pointer.

```

export interface TStylingRange {
 __brand__: 'TStylingRange';
 Shift and masks constants for encoding two numbers into and duplicate info into a single number.
 enum StylingRange {
 // Number of bits to shift for the previous pointer
 PREV_SHIFT = 17,
 // Previous pointer mask
 PREV_MASK = 0xFFFE0000,
 // Number of bits to shift for the next pointer
 NEXT_SHIFT = 2,
 // Next pointer mask
 NEXT_MASK = 0x001FFFC,
 // Mask to remove negative bit. (interpret number as positive)
 UNSIGNED_MASK = 0x7FFF,
 // This bit is set if the previous bindings contains a binding which could possibly cause a duplicate. For example: <div [style]=\"map\" [style.width]=\"width\">, the `width` binding will have previous duplicate set. The implication is that if `width` binding becomes `null`, it is necessary to defer the value to `map.width`. (Because `width` overwrites `map.width`.)
 PREV_DUPLICATE = 0x02,
 // This bit is set to if the next binding contains a binding which could possibly cause a duplicate. For example: <div [style]=\"map\" [style.width]=\"width\">, the `map` binding will have next duplicate set. The implication is that if `map.width` binding becomes not `null`, it is necessary to defer the value to `width`. (Because `width` overwrites `map.width`.)

resolving\n * dependencies.\n * An `Injector` is a replacement for a `new` operator, which can automatically
resolve the\n * constructor dependencies.\n * In typical use, application code asks for the dependencies in the
constructor and they are\n * resolved by the `Injector`.\n * @usageNotes\n * ### Example\n * The following
example creates an `Injector` configured to create `Engine` and `Car`.\n * ```typescript\n * @Injectable()\n *
class Engine {\n * }\n * @Injectable()\n * class Car {\n * constructor(public engine:Engine) {\n * }\n * }\n *
var injector = ReflectiveInjector.resolveAndCreate([Car, Engine]);\n * var car = injector.get(Car);\n * expect(car
instanceof Car).toBe(true);\n * expect(car.engine instanceof Engine).toBe(true);\n * ```\n * Notice, we don't use
the `new` operator because we explicitly want to have the `Injector`\n * resolve all of the object's dependencies
automatically.\n * @deprecated from v5 - slow and brings in a lot of code, Use `Injector.create` instead.\n *
@publicApi\n */\nexport abstract class ReflectiveInjector implements Injector {\n /**\n * Turns an array of
provider definitions into an array of resolved providers.\n * A resolution is a process of flattening multiple
nested arrays and converting individual\n * providers into an array of `ResolvedReflectiveProvider`s.\n *
@usageNotes\n * ### Example\n * ```typescript\n * @Injectable()\n * class Engine {\n * }\n *
@Injectable()\n * class Car {\n * constructor(public engine:Engine) {\n * }\n * }\n * var providers =
ReflectiveInjector.resolve([Car, [[Engine]]]);\n * expect(providers.length).toEqual(2);\n * expect(providers[0]

```

input which could be `string`, Object literal, or iterable and converts it into a consistent representation. The output of this is `KeyValueArray` (which is an array where even indexes contain keys and odd indexes contain values for those keys). The advantage of converting to `KeyValueArray` is that we can perform diff in an input independent way. (ie we can compare `foo bar` to `[bar, 'baz']` and determine a set of changes which need to be applied). The fact that `KeyValueArray` is sorted is very important because it allows us to compute the difference in linear fashion without the need to allocate any additional data. For example if we kept this as a `Map` we would have to iterate over previous `Map` to determine which values need to be deleted, over the new `Map` to determine additions, and we would have to keep additional `Map` to keep track of duplicates or items which have not yet been visited.

import { global } from './util/global';
import localeEn from './locale_en';

This const is used to store the locale data registered with `registerLocaleData`.
let LOCALE_DATA:
{[localeId: string]: any} = {};

Register locale data to be used internally by Angular. See the
["I18n
guide"](guide/i18n#i18n-pipes) to know how to import additional locale data.

The signature
`registerLocaleData(data: any, extraData?: any)` is deprecated since v5.1.

export function
registerLocaleData(data: any, localeId?: string | any, extraData?: any): void {
 if (typeof localeId !== 'string') {
 localeId =
 localeId;
 localeId = data[LocaleDataIndex.LocaleId];
 }
 localeId =
 localeId.toLowerCase().replace(/_/g, '-');
 LOCALE_DATA[localeId] = data;
 if (extraData) {
 LOCALE_DATA[localeId][LocaleDataIndex.ExtraData] = extraData;
 }
}

Finds the locale data for a
given locale.

@param locale The locale code.
@returns The locale data.
@see [Internationalization
(i18n) Guide](https://angular.io/guide/i18n)

export function findLocaleData(locale: string): any {
 const
 normalizedLocale = normalizeLocale(locale);
 let match = getLocaleData(normalizedLocale);
 if (match) {
 return match;
 }
 // let's try to find a parent locale
 const parentLocale = normalizedLocale.split('-')[0];
 match = getLocaleData(parentLocale);
 if (match) {
 return match;
 }
 if (parentLocale === 'en') {
 return localeEn;
 }
 throw new Error(`Missing locale data for the locale "${locale}`);
}

Retrieves the default currency code for the given locale.

The default is defined as the first currency which is
still in use.

@param locale The code of the locale whose currency code we want.
@returns The code of
the default currency for the given locale.

export function getLocaleCurrencyCode(locale: string):
string | null {
 const data = findLocaleData(locale);
 return data[LocaleDataIndex.CurrencyCode] ||
 null;
}

Retrieves the plural function used by ICU expressions to determine the plural case to use
for a given locale.

@param locale A locale code for the locale format rules to use.
@returns The plural function
for the locale.
@see `NgPlural`
@see [Internationalization (i18n) Guide](https://angular.io/guide/i18n)

export function getLocalePluralCase(locale: string): (value: number) => number {
 const data =
 findLocaleData(locale);
 return data[LocaleDataIndex.PluralCase];
}

Helper function to get the
given `normalizedLocale` from `LOCALE_DATA` or from the global `ng.common.locale`.

export
function getLocaleData(normalizedLocale: string): any {
 if (!(normalizedLocale in LOCALE_DATA)) {

```

```

`tNode` to `previousTNodes` list and update relevant `TNode`s in `previousTNodes` list\n *\n * `tNode.insertBeforeIndex`.\n *\n * Things to keep in mind:\n * 1. All i18n text nodes are encoded as
`TNodeType.Element` and are created eagerly by the\n * `i18nStart` instruction.\n * 2. All
`TNodeType.Placeholder` `TNodes` are elements which will be created later by\n * `elementStart` instruction.\n *
3. `elementStart` instruction will create `TNode`s in the ascending `TNode.index` order. (So a\n * smaller index
`TNode` is guaranteed to be created before a larger one)\n *\n * We use the above three invariants to determine
`TNode.insertBeforeIndex`.\n *\n * In an ideal world `TNode.insertBeforeIndex` would always be
`TNode.next.index`. However,\n * this will not work because `TNode.next.index` may be larger than `TNode.index`
which means that\n * the next node is not yet created and therefore we can't insert in front of it.\n *\n * Rule1:

```

```

`TNode.insertBeforeIndex = null` if `TNode.next` === null` (Initial condition, as we don't know if there will
be further `TNode`s inserted after.)\n * Rule2: If `previousTNode` is created after the `tNode` being inserted, then\n
* `previousTNode.insertBeforeNode = tNode.index` (So when a new `tNode` is added we check\n *
previous to see if we can update its `insertBeforeTNode`)\n *\n * See `TNode.insertBeforeIndex` for more
context.\n *\n * @param previousTNodes A list of previous TNodes so that we can easily traverse `TNode`s in\n *
reverse order. (If `TNode` would have `previous` this would not be necessary.)\n * @param newTNode A TNode to
add to the `previousTNodes` list.\n *\nexport function addTNodeAndUpdateInsertBeforeIndex(previousTNodes:

```

<https://github.com/angular/angular/commit/d5e3f2c64bd13ce83e7c70788b7fc514ca4a9918>

the `instructions.ts` file was moved to `instructions/instructions.ts` and an `index.ts` file was used to re-export everything. Having had file names that were importing from `instructions` directly (not the from the sub file or the `index.ts` file) caused strange CI issues. `index.ts` had to be renamed to `all.ts` for this to work.

Jira Issue = FW-1184

```

Resolves the providers which are defined in the DirectiveDef. When inserting the tokens and the factories in their respective arrays, we can assume that this method is called first for the component (if any), and then for other directives on the same node. As a consequence, the providers are always processed in that order:

- 1) The view providers of the component
- 2) The providers of the component
- 3) The providers of the other directives

This matches the structure of the injectables arrays of a view (for each node). So the tokens and the factories can be pushed at the end of the arrays, except in one case for multi providers.

```

@param def the directive definition
@param providers: Array of `providers`
@param viewProviders: Array of `viewProviders`
export function providersResolver<T>(\n def: DirectiveDef<T>,
providers: Provider[], viewProviders: Provider[]): void {\n const tView = getTView();\n if (tView.firstCreatePass) {\n const isComponent = isComponentDef(def);\n // The list of view providers is processed first, and the flags are updated\n resolveProvider(viewProviders, tView.data, tView.blueprint, isComponent, true);\n // Then, the list of providers is processed, and the flags are updated\n resolveProvider(providers, tView.data, tView.blueprint, isComponent, false);\n }\n}

```

Resolves a provider and publishes it to the DI system.

```

function resolveProvider(\n provider: Provider, tInjectables: TData, IInjectablesBlueprint: NodeInjectorFactory[],\n isComponent: boolean, isViewProvider: boolean): void {\n provider = resolveForwardRef(provider);\n if (Array.isArray(provider)) {\n // Recursively call `resolveProvider`\n // Recursion is OK in this case because this code will not be in hot-path once we implement\n // cloning of the initial state.\n for (let i = 0; i < provider.length; i++) {\n resolveProvider(provider[i], tInjectables, IInjectablesBlueprint, isComponent, isViewProvider);\n }\n } else {\n const tView = getTView();\n const IView = getLView();\n let token: any = isTypeProvider(provider) ? provider : resolveForwardRef(provider.provider);\n let providerFactory: () => any = providerToFactory(provider);\n const tNode = getCurrentTNode();\n const beginIndex = tNode.providerIndexes & TNodeProviderIndexes.ProvidersStartIndexMask;\n const endIndex = tNode.directiveStart;\n const cptViewProvidersCount = tNode.providerIndexes >> TNodeProviderIndexes.CptViewProvidersCountShift;\n if (isTypeProvider(provider) || !provider.multi) {\n // Single provider case: the factory is created and pushed immediately\n const factory = new NodeInjectorFactory(providerFactory, isViewProvider, directiveInject);\n const existingFactoryIndex = indexOf(token, tInjectables, isViewProvider ? beginIndex : beginIndex + cptViewProvidersCount,\n

 /**
 * Marks a view and all
of its ancestors dirty.
 *
 * It also triggers change detection by calling `scheduleTick` internally, which
coalesces
 * multiple `markForCheck` calls into one change detection run.
 *
 * This can be used to ensure
an { @link ChangeDetectionStrategy#OnPush OnPush } component is
 * checked when it needs to be re-rendered
but the two normal triggers haven't marked it
 * dirty (i.e. inputs haven't changed and events haven't fired in the
view).
 *
 * <!-- TODO: Add a link to a chapter on OnPush components -->
 * @usageNotes
 * ###
Example
 *
 * ```typescript
 * @Component({
 * selector: 'my-app',
 * template: `Number of ticks:
{{numberOfTicks}}`
 * changeDetection: ChangeDetectionStrategy.OnPush,
 * })
 * class AppComponent
 * {
 * numberOfTicks = 0;
 * constructor(private ref: ChangeDetectorRef) {
 * setInterval(() => {
 * this.numberOfTicks++;
 * // the following is required, otherwise the view will not be updated
 * this.ref.markForCheck();
 * }, 1000);
 * }
 * markForCheck(): void {
 * markViewDirty(this._cdRefInjectingView || this._IView);
 * }
 * }
 *
 * Detaches the view from the change
detection tree.
 *
 * Detached views will not be checked during change detection runs until they are
re-
 * attached, even if they are dirty. `detach` can be used in combination with
 * { @link
ChangeDetectorRef#detectChanges detectChanges } to implement local change
 * detection checks.
 *
 * <!--
TODO: Add a link to a chapter on detach/reattach/local digest -->
 * <!-- TODO: Add a live demo once
ref.detectChanges is merged into master -->
 * @usageNotes
 * ###
Example
 *
 * The following
example defines a component with a large list of readonly data.
 *
 * Imagine the data changes constantly, many
times per second. For performance reasons,
 * we want to check and update the list every five seconds. We can do
that by detaching
 * the component's change detector and doing a local check every five seconds.
 *
 * ```typescript
 * class DataProvider {
 * // in a real application the returned data will be different every time
 * get data() {
 * return [1,2,3,4,5];
 * }
 * }
 * @Component({
 * selector: 'giant-list',
 * template: `
<li *ngFor="let d of dataProvider.data">Data {{d}}
 * `
 * })
 * class GiantList
 * {
 * constructor(private ref: ChangeDetectorRef, private dataProvider: DataProvider) {
 * ref.detach();
 * setInterval(() => {
 * this.ref.detectChanges();
 * }, 5000);
 * }
 * }
 * @Component({
 * selector: 'app',
 * providers: [DataProvider],
 * template: `
<giant-list><giant-list>
 * `
 * })
 * class App {
 * }
 *
 * detach(): void {
 * this._IView[FLAGS] &= ~LViewFlags.Attached;
 * }
 *
 * Re-attaches a view to the change detection tree.
 *
 * This can be used to re-attach views that
were previously detached from the tree
 * using { @link ChangeDetectorRef#detach detach }. Views are attached

```

to the tree by default.

```

 * <!-- TODO: Add a link to a chapter on detach/reattach/local digest -->
 * @usageNotes
 * ### Example
 * The following example creates a component displaying `live` data. The
 * component will detach its change detector from the main change detector tree when the component's live
 * property is set to false.
 * ```typescript
 * class DataProvider {
 * data = 1;
 * constructor() {
 * setInterval(() => {
 * this.data = this.data * 2;
 * }, 500);
 * }
 * }
 * @Component({
 * selector: 'live-data',
 * inputs: ['live'],
 * template: 'Data: {{dataProvider.data}}'
 * })
 * class LiveData {
 * constructor(private ref: ChangeDetectorRef, private dataProvider: DataProvider) {}
 * set live(value) {
 * if (value) {
 * this.ref.reattach();
 * } else {
 * this.ref.detach();
 * }
 * }
 * }
 * @Component({
 * selector: 'my-app',
 * providers: [DataProvider],
 * template: `
 * Live Update: <input type="checkbox" [(ngModel)]="live">
 * <live-data
 * [live]="live"><live-data>
 * `
 * })
 * class AppComponent {
 * live = true;
 * }
 * ```
 * reattach(): void {
 * this._lView[FLAGS] |= LViewFlags.Attached;
 * }
 * /**
 * Checks the view and its
 * children.
 * This can also be used in combination with {@link ChangeDetectorRef#detach detach} to
 * implement local change detection checks.
 * <!-- TODO: Add a link to a chapter on
 * detach/reattach/local digest -->
 * <!-- TODO: Add a live demo once ref.detectChanges is merged into master --
 * >
 * @usageNotes

 * Base class that provides change
 * detection functionality. A change-detection tree collects all views that are to be checked for changes. Use
 * the methods to add and remove views from the tree, initiate change-detection, and explicitly mark views as
 * _dirty_, meaning that they have changed and need to be re-rendered.
 * @see [Using change detection
 * hooks](guide/lifecycle-hooks#using-change-detection-hooks)
 * @see [Defining custom change
 * detection](guide/lifecycle-hooks#defining-custom-change-detection)
 * @usageNotes
 * The following
 * examples demonstrate how to modify default change-detection behavior to perform explicit detection when

```

needed. `### Use `markForCheck()` with `CheckOnce` strategy`

The following example sets the `OnPush` change-detection strategy for a component` (`CheckOnce`, rather than the default CheckAlways`), then forces a second check` after an interval. See [live demo](http://plnkr.co/edit/GC512b?p=preview).`

```
<code-example path="core/ts/change_detect/change-detection.ts" region="mark-for-check">
Detach change detector to limit how often check occurs
The following example defines a component with a large list of read-only data that is expected to change constantly, many times per second. To improve performance, we want to check and update the list less often than the changes actually occur. To do that, we detach the component's change detector and perform an explicit local check every five seconds.
<code-example path="core/ts/change_detect/change-detection.ts" region="detach">
Reattaching a detached component
The following example creates a component displaying live data. The component detaches its change detector from the main change detector tree when the `live` property is set to false, and reattaches it when the property becomes true.
<code-example path="core/ts/change_detect/change-detection.ts" region="reattach">
@publicApi

 // This function calls the ngAfterContentCheck, ngAfterContentInit,
 // ngAfterViewCheck,
 // and ngAfterViewInit lifecycle hooks (depending on the node
 // flags in lifecycle). Unlike ngDoCheck,
 // ngOnChanges and ngOnInit, which are
 // called during a pre-order traversal of the view tree (that is calling the
 // parent hooks before the child hooks) these events are sent in using a
 // post-order traversal of the tree (children
 // before parents). This changes the
 // meaning of initIndex in the view state. For ngOnInit, initIndex tracks the
 // expected nodeIndex which a ngOnInit should be called. When sending
 // ngAfterContentInit and ngAfterViewInit
 // it is the expected count of
 // ngAfterContentInit or ngAfterViewInit methods that have been called. This
 // ensure
 // that despite being called recursively or after picking up after an
 // exception, the ngAfterContentInit or
 // ngAfterViewInit will be called on the
 // correct nodes. Consider for example, the following (where E is an
 // element
 // and D is a directive)
 // Tree:
 // pre-order index post-order index
 // E1 0 6 E2
 // 1 1 D3 2 0 E4 3 5 E5 4 4 E6 5
 // 2 E7 6 3
 // As can be seen, the post-order index has an unclear relationship to the
 // pre-order
 // index (postOrderIndex === preOrderIndex - parentCount + childCount). Since number of calls to
 // ngAfterContentInit and ngAfterViewInit
 // are stable (will be the same for the same view regardless of exceptions
 // or
 // recursion) we just need to count them which will roughly correspond to the
 // post-order index (it skips
 // elements and directives that do not have
 // lifecycle hooks).
 // For example, if an exception is raised in the
 // E6.onAfterViewInit() the
 // initIndex is left at 3 (by shouldCallLifecycleInitHook() which set it to
 // initIndex +
 // 1). When checkAndUpdateView() is called again D3, E2 and E6 will
 // not have their ngAfterViewInit() called but,
 // starting with E7, the rest of
 // the view will begin getting ngAfterViewInit() called until a check and
 // pass is
 // complete.
 // This algorithm also handles recursion. Consider if E4's ngAfterViewInit()
 // indirectly calls E1's
 // ChangeDetectorRef.detectChanges(). The expected
 // initIndex is set to 6, the recursive checkAndUpdateView()
 // starts walk again.
 // D3, E2, E6, E7, E5 and E4 are skipped, ngAfterViewInit() is called on E1.
 // When the
 // recursion returns the initIndex will be 7 so E1 is skipped as it
 // has already been called in the recursively called
 // checkAnUpdateView().

without bloating bundles (modules are registered when otherwise not referenced).\n //\n // In View Engine,
registration occurs in the .ngfactory.js file as a side effect. This has\n // several practical consequences:\n //\n
// - If an .ngfactory file is not imported from, the module won't be registered (and can be\n // tree shaken).\n
// - If an .ngfactory file is imported from, the module will be registered even if an instance\n // is not actually
created (via `create` below).\n // - Since an .ngfactory file in View Engine references the .ngfactory files of the
NgModule's\n // imports,\n //\n // In Ivy, things are a bit different. .ngfactory files still exist for
compatibility, but are\n // not a required API to use - there are other ways to obtain an NgModuleFactory for a
given\n // NgModule. Thus, relying on a side effect in the .ngfactory file is not sufficient. Instead,\n // the side
effect of registration is added here, in the constructor of NgModuleFactory,\n // ensuring no matter how a factory
is created, the module is registered correctly.\n //\n // An alternative would be to include the registration side
effect inline following the actual\n // NgModule definition. This also has the correct timing, but breaks tree-
shaking - modules\n // will be registered and retained even if they're otherwise never referenced.\n

```

```

export type DirectiveDefWithMeta<T, Selector extends string, ExportAs extends string[], InputMap extends {[key: string]: string}, OutputMap extends {[key: string]: string}, QueryFields extends string[]> = DirectiveDef<T>;

```

Runtime link information for Directives.

This is an internal data structure used by the render to link directives into templates.

NOTE: Always use `defineDirective` function to create this object, never create the object directly since the shape of this object can change between versions.

```

@param Selector type metadata specifying the selector of the directive or component
See: { @link defineDirective }

```

```

export interface DirectiveDef<T> {
 inputs: {[P in keyof T]: string};
 @deprecated
 readonly declaredInputs: {[P in keyof T]: string};
 outputs: {[P in keyof T]: string};
 @deprecated
 readonly outputs: {[P in keyof T]: string};
 contentQueries: ContentQueriesFunction<T>|null;
 queryRelatedInstructions: QueryRelatedInstructions;
 viewQuery: ViewQueriesFunction<T>|null;
 refreshesHostBindings: HostBindingsFunction<T>|null;
 readonly hostBindings: HostBindingsFunction<T>|null;
 readonly hostVars: number;
 assignStaticAttributeValues: AssignStaticAttributeValues;
 hostAttrs: AssignStaticAttributeValues;
}

```

This is only here because `NgOnChanges` incorrectly uses declared name instead of public or minified name.

```

readonly declaredInputs: {[P in keyof T]: string};
readonly outputs: {[P in keyof T]: string};

```

Function to create and refresh content queries associated with a given directive.

```

contentQueries: ContentQueriesFunction<T>|null;

```

Query-related instructions for a directive. Note that while directives don't have a view and as such view queries won't necessarily do anything, there might be components that extend the directive.

```

viewQuery: ViewQueriesFunction<T>|null;
refreshesHostBindings: HostBindingsFunction<T>|null;
readonly hostBindings: HostBindingsFunction<T>|null;
readonly hostVars: number;
assignStaticAttributeValues: AssignStaticAttributeValues;
hostAttrs: AssignStaticAttributeValues;

```

Refreshes host bindings on the associated directive.

```

readonly hostBindings: HostBindingsFunction<T>|null;

```

The number of bindings in this directive `hostBindings` (including pure fn bindings).

```

readonly hostVars: number;

```

Used to calculate the length of the component's LView array, so we can pre-fill the array and set the host binding start index.

```

assignStaticAttributeValues: AssignStaticAttributeValues;
hostAttrs: AssignStaticAttributeValues;

```

Assign static attribute values to a host element. This property will assign static attribute values as well as class and style values to a host element. Since attribute values can consist of different types of values, the `hostAttrs` array must include the values in the following format:

```

// static attributes (like `title`, `name`, `id`...)
attr1, value1, attr2, value,
// a single namespace value (like `x:id`)
NAMESPACE_MARKER, namespaceUri1, name1, value1,

```

another single namespace value (like `x:name`)\n \* `NAMESPACE_MARKER`, namespaceUri2, name2, value2,\n \*  
 \*\n \* // a series of CSS classes that will be applied to the element (no spaces)\n \* `CLASSES_MARKER`,  
 class1, class2, class3,\n \*  
 \*\n \* // a series of CSS styles (property + value) that will be applied to the element\n \*  
`STYLES_MARKER`, prop1, value1, prop2, value2\n \* ]\n \*  
 \*\n \* All non-class and non-style attributes must be  
 defined at the start of the list\n \* first before all class and style values are set. When there is a change in value\n \*  
 type (like when classes and styles are introduced) a marker must be used to separate\n \* the entries. The marker  
 values themselves are set via entries found in the\n \* `[AttributeMarker]` enum.\n \*  
 \*\n \* readonly hostAttrs:  
 TAttributes|null;\n \*  
 \*\* Token representing the directive. Used by DI. \*\n \*  
 \*\n \* readonly type: Type<T>;\n \*  
 \*\*  
 Function that resolves providers and publishes them into the DI system. \*\n \*  
 \*\n \* providersResolver:\n \* (`U` extends  
 T>(def: DirectiveDef<U>, processProvidersFn?: ProcessProvidersFunction) =>\n \*

component.  
`styles?: string[];`  
 \* One or more animation `trigger()` calls, containing `state()` and `transition()` definitions. See the [Animations guide](/guide/animations) and animations API documentation.  
`animations?: any[];`  
 \* An encapsulation policy for the template and CSS styles. One of:  
 \* - `ViewEncapsulation.Emulated`: Use shimmed CSS that emulates the native behavior.  
 \* - `ViewEncapsulation.None`: Use global CSS without any encapsulation.  
 \* - `ViewEncapsulation.ShadowDom`: Use Shadow DOM v1 to encapsulate styles.  
 \* If not supplied, the value is taken from `CompilerOptions`. The default compiler option is `ViewEncapsulation.Emulated`.  
 \* If the policy is set to `ViewEncapsulation.Emulated` and the component has no `styles` or `styleUrls` specified, the policy is automatically switched to `ViewEncapsulation.None`.  
`encapsulation?: ViewEncapsulation;`  
 \* Overrides the default encapsulation start and end delimiters (`{`` and ``}`)  
`interpolation?: [string, string];`  
 \* A set of components that should be compiled along with this component. For each component listed here, Angular creates a `@link ComponentFactory` and stores it in the `@link ComponentFactoryResolver`.  
 \* @deprecated Since 9.0.0. With Ivy, this property is no longer necessary.  
`entryComponents?: Array<Type<any>|any[]>;`  
 \* True to preserve or false to remove potentially superfluous whitespace characters from the compiled template. Whitespace characters are those matching the `\s` character class in JavaScript regular expressions. Default is false, unless overridden in compiler options.  
`preserveWhitespaces?: boolean;`  
 \* Component decorator and metadata.  
`@Annotation`  
`@publicApi`  
`export const Component: ComponentDecorator = makeDecorator(  
 'Component', (c: Component = {}) => ({changeDetection: ChangeDetectionStrategy.Default, ...c}),  
 Directive, undefined,  
 (type: Type<any>, meta: Component) => SWITCH_COMPILE_COMPONENT(type, meta));`  
 \* Type of the Pipe decorator / constructor function.  
`@publicApi`  
`export interface PipeDecorator {  
 * Decorator that marks a class as pipe and supplies configuration metadata.  
 * A pipe class must implement the PipeTransform interface. For example, if the name is "myPipe", use a template binding expression such as the following:  
{{ exp | myPipe }}  
 * The result of the expression is passed to the pipe's transform() method.  
 * A pipe must belong to an NgModule in order for it to be available to a template. To make it a member of an NgModule, list it in the declarations field of the NgModule metadata.  
 * @see [Style Guide: Pipe Names](guide/styleguide#02-09)  
 * (obj: Pipe): TypeDecorator;  
 * See the Pipe decorator.  
 * new(obj: Pipe): Pipe;`  
 \* Type of the Pipe metadata.  
`@publicApi`  
`export interface Pipe {  
 * The pipe name to use in template bindings. Typically uses [lowerCamelCase](guide/glossary#case-types) because the name cannot contain hyphens.  
 * name: string;  
 * When true, the pipe is pure, meaning that the transform() method is invoked only when its input arguments change. Pipes are pure by default.  
 * If the pipe has internal state (that is, the result depends on state other than its arguments), set pure to false. In this case, the pipe is invoked on each change-detection cycle, even if the arguments have not changed.  
 * pure?: boolean;`  
`@Annotation`  
`@publicApi`  
`export const Pipe: PipeDecorator = makeDecorator(  
 'Pipe', (p: Pipe) => ({pure: true, ...p}), undefined, undefined,  
 (type: Type<any>, meta: Pipe) => SWITCH_COMPILE_PIPE(type, meta));`  
`@publicApi`  
`export interface InputDecorator {  
 * Decorator that marks a class field as an input property and supplies configuration metadata.  
 * The input property is bound to a DOM property in the template. During change detection, Angular automatically updates the data property with the DOM property's value.  
 * @usageNotes  
 * You can supply an optional name to use in templates when the component is instantiated, that maps to the name of the bound property. By default, the original name of the bound property is used for input binding.  
 * The following example creates a component with two input properties, one of which is given a special binding name.  
typescript  
@Component({  
 selector: 'bank-account',  
 template: `Bank Name: {{bankName}} Account Id: {{id}}`  
 })  
 class BankAccount {  
 // This property is bound using its original name.  
 @Input() bankName: string;  
 // this property value is bound to a different property name  
 // when this component is instantiated in a template.  
 @Input('account-id') id: string;  
 // this property is not bound, and is not automatically`

updated by Angular

```

 * normalizedBankName: string;
 }
 * @Component({
 * selector: 'app',
 * template: `
 * <bank-account bankName="RBC" account-id="4747"></bank-account>
 * `
 * })
 * class App {}
 * ``
 * @see [Input and Output properties](guide/inputs-outputs)
 * ^
 (bindingPropertyName?: string): any;
 new(bindingPropertyName?: string): any;
 }
 * Type of metadata
 for an `Input` property.
 * @publicApi
 * ^
 export interface Input {
 * /**
 * The name of the DOM
 property to which the input property is bound.
 * ^
 bindingPropertyName?: string;
 }
 * @Annotation
 * @publicApi
 * ^
 export const Input: InputDecorator =
 * makePropDecorator('Input', (bindingPropertyName?:
 string) => ({bindingPropertyName}));
 * Type of the Output decorator / constructor function.
 * @publicApi
 * ^
 export interface OutputDecorator {
 * /**
 * Decorator that marks a class field as an output
 property and supplies configuration metadata.
 * The DOM property bound to the output property is automatically
 updated during change detection.
 * @usageNotes
 * You can supply an optional name to use in
 templates when the
 * component is instantiated, that maps to the
 * name of the bound property. By default,
 the original
 * name of the bound property is used for output binding.
 * See `Input` decorator for an
 example of providing a binding name.
 * @see [Input and Output properties](guide/inputs-outputs)
 * ^
 (bindingPropertyName?: string): any;
 new(bindingPropertyName?: string): any;
 }
 * Type of the
 Output metadata.
 * @publicApi
 * ^
 export interface Output {
 * /**
 * The name of the DOM property to
 which the output property is bound.
 * ^
 bindingPropertyName?: string;
 }
 * @Annotation
 * @publicApi
 * ^
 export const Output: OutputDecorator =
 * makePropDecorator('Output',
 (bindingPropertyName?: string) => ({bindingPropertyName}));
 * Type of the HostBinding decorator /
 constructor function.
 * @publicApi
 * ^
 export interface HostBindingDecorator {
 * /**
 * Decorator that
 marks a DOM property as a host-binding property and supplies configuration
 * metadata.
 * Angular
 automatically checks host property bindings during change detection, and
 * if a binding changes it updates the
 host element of the directive.
 * @usageNotes
 * The following example creates a directive that sets
 the `valid` and `invalid`
 * properties on the DOM element that has an `ngModel` directive on it.
 * ``
 * typescript
 * @Directive({selector: '[ngModel]'})
 * class NgModelStatus {
 * constructor(public control:
 NgModel) {}
 * @HostBinding('class.valid') get valid() { return this.control.valid; }
 * @HostBinding('class.invalid') get invalid() { return this.control.invalid; }
 * }
 * @Component({
 * selector: 'app',
 * template: `<input [(ngModel)]="prop">`,
 * })
 * class App {
 * prop;
 * }
 * ``
 * ^
 (hostPropertyName?: string): any;
 new(hostPropertyName?: string): any;
 }
 * Type of
 the HostBinding metadata.
 * @publicApi
 * ^
 export interface HostBinding {
 * /**
 * The DOM property
 that is bound to a data property.
 * ^
 hostPropertyName?: string;
 }
 * @Annotation
 * @publicApi
 * ^
 export const HostBinding: HostBindingDecorator =
 * makePropDecorator('HostBinding',
 (hostPropertyName?: string) => ({hostPropertyName}));
 * Type of the HostListener decorator /
 constructor function.
 * @publicApi
 * ^
 export interface HostListenerDecorator {
 * /**
 * Decorator that
 declares a DOM event to listen for,
 * and provides a handler method to run when that event occurs.
 * ^
 (eventName: string, args?: string[]): any;
 new(eventName: string, args?: string[]): any;
 }
 * Type of the
 HostListener metadata.
 * @publicApi
 * ^
 export interface HostListener {
 * /**
 * The DOM event to
 listen for.
 * ^
 eventName?: string;
 * /**
 * A set of arguments to pass to the handler method when the event
 occurs.
 * ^
 args?: string[];
 }
 * Decorator that binds a DOM event to a host listener and supplies
 configuration metadata.
 * Angular invokes the supplied handler method when the host element emits the specified
 event,
 * and updates the bound element with the result.
 * If the handler method returns false, applies
 `preventDefault` on the bound element.
 * @usageNotes
 * The following example declares a directive
 that attaches a click listener to a button and counts clicks.
 * ``
 * ts
 * @Directive({selector:
 'button[counting]'})
 * class CountClicks {
 * numberOfClicks = 0;
 * @HostListener('click',
 ['$event.target'])
 * onClick(btn) {
 * console.log('button', btn, 'number of clicks:', this.numberOfClicks++);
 * }
 * }
 * @Component({
 * selector: 'app',
 * template: `<button counting>Increment</button>`,
 * })
 * class App {}
 * ``
 * The following example registers another DOM event handler that listens for
 key-press events.
 * ``
 * ts
 * import { HostListener, Component } from '@angular/core';
 *

```

```

* The following example allows the CommonModule to use the `NgFor` directive.
* ```javascript
@NgModule({
 declarations: [NgFor]
})
class CommonModule {}
declarations?: Array<Type<any>|any[]>;
/**
 * The set of NgModules whose exported
 [declarables](guide/glossary#declarable)
 * are available to templates in this module.
 *
 * @usageNotes
 *
 * A template can use exported declarables from any
 * imported module, including those from modules that
 are imported indirectly
 * and re-exported.
 * For example, `ModuleA` imports `ModuleB`, and also exports
 * it, which makes the declarables from `ModuleB` available
 * wherever `ModuleA` is imported.
 * ###
 Example
 *
 * The following example allows MainModule to use anything exported by
 `CommonModule`:
 * ```javascript
 * @NgModule({
 * imports: [CommonModule]
 * })
 * class
 MainModule {}
 * ```
 * imports?: Array<Type<any>|ModuleWithProviders<{}>|any[]>;
 /**
 * The set of components, directives, and pipes declared in this
 * NgModule that can be used in the
 template of any component that is part of an
 * NgModule that imports this NgModule. Exported declarations are
 the module's public API.
 *
 * A declarable belongs to one and only one NgModule.
 * A module can list
 another module among its exports, in which case all of that module's
 * public declaration are exported.
 *
 * @usageNotes
 *
 * Declarations are private by default.
 * If this ModuleA does not export UserComponent,
 then only the components within this
 * ModuleA can use UserComponent.
 *
 * ModuleA can import
 ModuleB and also export it, making exports from ModuleB
 * available to an NgModule that imports ModuleA.
 *
 * ### Example
 *
 * The following example exports the `NgFor` directive from CommonModule.
 * ```javascript
 * @NgModule({
 * exports: [NgFor]
 * })
 * class CommonModule {}
 * ```
 * exports?: Array<Type<any>|any[]>;
 /**
 * The set of components to compile when this NgModule is
 defined,
 * so that they can be dynamically loaded into the view.
 *
 * For each component listed here,
 Angular creates a `ComponentFactory`
 * and stores it in the `ComponentFactoryResolver`.
 *
 * Angular
 automatically adds components in the module's bootstrap
 * and route definitions into the `entryComponents` list.
 Use this
 * option to add components that are bootstrapped
 * using one of the imperative techniques, such as
 `ViewContainerRef.createComponent`.
 *
 * @see [Entry Components](guide/entry-components)
 *
 * @deprecated Since 9.0.0. With Ivy, this property is no longer necessary.
 *
 * entryComponents?:
 Array<Type<any>|any[]>;
 /**
 * The set of components that are bootstrapped when
 * this module is
 bootstrapped. The components listed here
 * are automatically added to `entryComponents`.
 *
 * bootstrap?:
 Array<Type<any>|any[]>;
 /**
 * The set of schemas that declare elements to be allowed in the NgModule.
 *
 * Elements and properties that are neither Angular components nor directives
 * must be declared in a schema.
 *
 * Allowed value are `NO_ERRORS_SCHEMA` and `CUSTOM_ELEMENTS_SCHEMA`.
 *
 * @security When using one of `NO_ERRORS_SCHEMA` or `CUSTOM_ELEMENTS_SCHEMA`
 * you must
 ensure that allowed elements and properties securely escape inputs.
 *
 * schemas?:
 Array<SchemaMetadata|any[]>;
 /**
 * A name or path that uniquely identifies this NgModule in
 `getModuleFactory`.
 *
 * If left `undefined`, the NgModule is not registered with
 * `getModuleFactory`.
 *
 * id?: string;
 /**
 * When present, this module is ignored by the AOT compiler.
 *
 * It remains in distributed
 code, and the JIT compiler attempts to compile it
 * at run time, in the browser.
 *
 * To ensure the correct
 behavior, the app must import `@angular/compiler`.
 *
 * jit?: true;
 *
 * @Annotation
 *
 * @publicApi
 *
 * export const NgModule: NgModuleDecorator = makeDecorator(
 * 'NgModule', (ngModule:
 NgModule) => ngModule, undefined, undefined,
 /**
 * Decorator that marks the following class as an

Deprecation notice:\n * \n * The default currency code is currently always `USD` but this is deprecated from
v9.\n * \n * **In v10 the default currency code will be taken from the current locale.**\n * \n * If you need the
previous behavior then set it by creating a `DEFAULT_CURRENCY_CODE` provider in\n * your application\n * `NgModule`:\n * \n * ```ts\n * {provide: DEFAULT_CURRENCY_CODE, useValue: 'USD'}\n * \n * \n * \n *
</div>\n * \n * @usageNotes\n * ### Example\n * \n * ```typescript\n * import { platformBrowserDynamic } from
'@angular/platform-browser-dynamic';\n * import { AppModule } from './app/app.module';\n * \n *
platformBrowserDynamic().bootstrapModule(AppModule, {\n * providers: [{provide:
DEFAULT_CURRENCY_CODE, useValue: 'EUR'}]\n * });\n * \n * \n * \n * @publicApi\n *\nexport const
DEFAULT_CURRENCY_CODE = new InjectionToken<string>('DefaultCurrencyCode');\n\n/**\n * Use this token
at bootstrap to provide the content of your translation file (`xtb`,\n * `xlf` or `xlf2`) when you want to translate your
application in another language.\n * \n * See the [i18n guide](guide/i18n#merge) for more information.\n * \n *
@usageNotes\n * ### Example\n * \n * ```typescript\n * import { TRANSLATIONS } from '@angular/core';\n *

```

```

import { platformBrowserDynamic } from '@angular/platform-browser-dynamic';
import { AppModule } from './app/app.module';
const translations = '...';
platformBrowserDynamic().bootstrapModule(AppModule, {
 providers: [{ provide: TRANSLATIONS, useValue: translations }]
});
@publicApi
export const TRANSLATIONS = new InjectionToken<string>('Translations');
Provide this token at bootstrap to set the format of your { @link TRANSLATIONS }: `xtb` or `xlf` or `xlf2`. See the [i18n guide](guide/i18n#merge) for more information.
@usageNotes
Example
typescript
import { TRANSLATIONS_FORMAT } from '@angular/core';
import { platformBrowserDynamic } from '@angular/platform-browser-dynamic';
import { AppModule } from './app/app.module';
platformBrowserDynamic().bootstrapModule(AppModule, {
 providers: [{ provide: TRANSLATIONS_FORMAT, useValue: 'xlf' }]
});
@publicApi
export const TRANSLATIONS_FORMAT = new InjectionToken<string>('TranslationsFormat');
Use this enum at bootstrap as an option of `bootstrapModule` to define the strategy that the compiler should use in case of missing translations:
- Error: throw if you have missing translations.
- Warning (default): show a warning in the console and/or shell.
- Ignore: do nothing.
See the [i18n guide](guide/i18n#missing-translation) for more information.
@usageNotes
Example
typescript
import { MissingTranslationStrategy } from '@angular/core';
import { platformBrowserDynamic } from '@angular/platform-browser-dynamic';
import { AppModule } from './app/app.module';
platformBrowserDynamic().bootstrapModule(AppModule, {
 missingTranslation: MissingTranslationStrategy.Error
});
@publicApi
export enum MissingTranslationStrategy {
 Error = 0,
 Warning = 1,
 Ignore = 2,
}
