* Source:\n      *\n
https://github.com/webcomponents/webcomponentsjs/blob/4efecd7e0e/src/ShadowCSS/ShadowCSS.js\n      *\n      *
The original file level comment is reproduced below\n      *\n      /**\n      This is a limited shim for ShadowDOM css
styling.\n      https://dvcs.w3.org/hg/webcomponents/raw-file/tip/spec/shadow/index.html#styles\n      The
intention here is to support only the styling features which can be\n      relatively simply implemented. The goal is to
allow users to avoid the\n      most obvious pitfalls and do so without compromising performance significantly.\n
For ShadowDOM styling that's not covered here, a set of best practices\n      can be provided that should allow users
to accomplish more complex styling.\n      The following is a list of specific ShadowDOM styling features and a
brief\n      discussion of the approach used to shim.\n      Shimmed features:\n      *:host, :host-context:\n
ShadowDOM allows styling of the shadowRoot's host\n      element using the :host rule. To shim this feature, the
:host styles are\n      reformatted and prefixed with a given scope name and promoted to a\n      document level
stylesheet.\n      For example, given a scope name of .foo, a rule like this:\n      :host {\n          background:
red;\n      }\n      becomes:\n      .foo {\n          background: red;\n      }\n      * encapsulation:\n
Styles defined within ShadowDOM, apply only to\n      dom inside the ShadowDOM. Polymer uses one of two
techniques to implement\n      this feature.\n      By default, rules are prefixed with the host element tag name\n
as a descendant selector. This ensures styling does not leak out of the 'top'\n      of the element's ShadowDOM. For
example,\n      div {\n          font-weight: bold;\n      }\n      becomes:\n      x-foo div {\n          font-weight:
bold;\n      }\n      becomes:\n      Alternatively, if WebComponents.ShadowCSS.strictStyling is set to true
then\n      selectors are scoped by adding an attribute selector suffix to each\n      simple selector that contains the
host element tag name. Each element\n      in the element's ShadowDOM template is also given the scope attribute.\n
      Thus, these rules match only elements that have the scope attribute.\n      For example, given a scope name of x-
foo, a rule like this:\n      div {\n          font-weight: bold;\n      }\n      becomes:\n      div[x-foo] {\n

```

font-weight: bold; } Note that elements that are dynamically added to a scope must have the scope selector added to them manually.

* upper/lower bound encapsulation: Styles which are defined outside a shadowRoot should not cross the ShadowDOM boundary and should not apply inside a shadowRoot. This styling behavior is not emulated. Some possible ways to do this that were rejected due to complexity and/or performance concerns include: (1) reset every possible property for every possible selector for a given scope name; (2) re-implement css in javascript.

As an alternative, users should make sure to use selectors specific to the scope in which they are working.

* ::distributed: This behavior is not emulated. It's often not necessary to style the contents of a specific insertion point and instead, descendants of the host element can be styled selectively. Users can also create an extra node around an insertion point and style that node's contents via descendent selectors. For example, with a shadowRoot like this:

```
<style>
::content(div) {
  background: red;
}
</style>
<content></content>
could become:
<style>
/*@polyfill .content-container div * ^::content(div) {
  background: red;
}
</style>
<div class="content-container">
  <content></content>
</div>
```

Note the use of @polyfill in the comment above a ShadowDOM specific style declaration. This is a directive to the styling shim to use the selector in comments in lieu of the next selector when running under polyfill.

```
*^
var ShadowCss = /** @class */ (function () {
  function ShadowCss() {
    this.strictStyling = true;
  }
  /*
   * Shim some cssText with the given selector. Returns cssText that can be included in the document via WebComponents.ShadowCSS.addCssToDocument(css).
   * When strictStyling is true:
   * - selector is the attribute added to all elements inside the host,
   * - hostSelector is the attribute added to the host itself.

/**
 * This visitor can walk HTML parse tree
and remove / trim text nodes using the following rules:
 * - consider spaces, tabs and new lines as whitespace
characters;
 * - drop text nodes consisting of whitespace characters only;
 * - for all other text nodes replace
consecutive whitespace characters with one space;
 * - convert &nbsp; pseudo-entity to a single space;
 *
 * Removal and trimming of whitespaces have positive performance impact (less code to generate
 * while
compiling templates, faster view creation). At the same time it can be "destructive"
 * in some cases
(whitespaces can influence layout). Because of the potential of breaking layout
 * this visitor is not activated by
default in Angular 5 and people need to explicitly opt-in for
 * whitespace removal. The default option for
whitespace removal will be revisited in Angular 6
 * and might be changed to "on" by default.
 *

```

`element1,element2,...^parentElement`. \n * Here the individual elements are separated by `,` (commas). Every
element in the list \n * has identical properties. \n * \n * An `element` may inherit additional properties from
`parentElement` If no `parentElement` is \n * specified then `""` (blank) element is assumed. \n * \n *
NOTE: The blank element inherits from root `[Element]` element, the super element of all \n * elements. \n * \n
* NOTE an element prefix such as `:svg:` has no special meaning to the schema. \n * \n * ## Properties \n * \n
* Each element has a set of properties separated by `,` (commas). Each property can be prefixed \n * by a special
character designating its type: \n * \n * - (no prefix): property is a string. \n * - `*`: property represents an
event. \n * - `!`: property is a boolean. \n * - `#`: property is a number. \n * - `%`: property is an object. \n * \n
* ## Query \n * \n * The class creates an internal squas representation which allows to easily answer the query
of \n * if a given property exist on a given element. \n * \n * NOTE: We don't yet support querying for types or
events. \n * NOTE: This schema is auto extracted from `schema_extractor.ts` located in the test folder, \n *
see dom_element_schema_registry_spec.ts \n * \n //

If it is not\n * empty, it must begin with a slash.\n * @param opt_queryData The URI-encoded query data.\n * @param opt_fragment The URI-encoded fragment identifier.\n * @return The fully combined URI.\n */\n function _buildFromEncodedParts(opt_scheme, opt_userInfo, opt_domain, opt_port, opt_path, opt_queryData, opt_fragment) {\n var out = [];\n if (opt_scheme != null) {\n out.push(opt_scheme + ':');\n }\n if (opt_domain != null) {\n out.push('//');\n if (opt_userInfo != null) {\n out.push(opt_userInfo + '@');\n }\n out.push(opt_domain);\n if (opt_port != null) {\n out.push(': ' + opt_port);\n }\n }\n if (opt_path != null) {\n out.push(opt_path);\n }\n if (opt_queryData != null) {\n out.push('? ' + opt_queryData);\n }\n if (opt_fragment != null) {\n out.push('# ' + opt_fragment);\n }\n return out.join('');\n }\n /**\n * A regular expression for breaking a URI into its component parts.\n * @link http://www.gbiv.com/protocols/uri/rfc/rfc3986.html#RFC2234\n * As the "first-match-wins" algorithm is identical to the "greedy" disambiguation method used by POSIX regular expressions, it is natural and commonplace to use a regular expression for parsing the potential five components of a URI reference.\n * The following line is the regular expression for breaking-down a well-formed URI reference into its components.\n * <pre>\n ^(([^:/?#]+):)?(//([^/?#]*))?([^?#]*)(\\?([^#]*))?(#(.*))? 12 3 4 5 6 7 8 9\n * </pre>\n * The numbers in the second line above are only to assist readability; they indicate the reference points for each subexpression (i.e., each paired parenthesis). We refer to the value matched for subexpression <n> as $<n>.\n * For example, matching the above expression to\n * <pre>\n http://www.ics.uci.edu/pub/ietf/uri/#Related\n * </pre>\n * results in the following subexpression matches:\n * <pre>\n * $1 = http\n * $2 = http\n * $3 = //www.ics.uci.edu\n * $4 = www.ics.uci.edu\n * $5 = /pub/ietf/uri/\n * $6 = <undefined>\n * $7 = <undefined>\n * $8 = #Related\n * $9 = Related\n * </pre>\n * where <undefined> indicates that the component is not present, as is the case for the query component in the above example. Therefore, we can determine the value of the five components as\n * <pre>\n * scheme = $2\n * authority = $4\n * path = $5\n * query = $7\n * fragment = $9\n * </pre>\n * The regular expression has been modified slightly to expose the userInfo, domain, and port separately from the authority.\n * The modified version yields\n * <pre>\n * $1 = http\n * $2 = <undefined>\n * $3 = www.ics.uci.edu\n * $4 = domain\n * $5 = authority\n * $6 = <undefined>\n * $7 = port\n * $8 = /pub/ietf/uri/\n * $9 = path\n * $10 = <undefined>\n * $11 = <undefined>\n * $12 = Related\n * $13 = fragment without #\n * </pre>\n * @internal\n * @param var _splitRe = new RegExp('^ + (?: + ([^:/?#.] + // scheme - ignore special characters // used by other URL parts such as :, // ?, /, #, and . ':)? + (?:// + (?:([^\?#]*)@)? + // userInfo '([\\w\\d\\-\\.\\u0100-\\uffff.%]*)' + // domain - restrict to letters, // digits, dashes, dots, percent // escapes, and unicode characters. '(?:([0-9]+))?' + // port ')' + '([^?#]+)' + // path '(?:\\?([^\?#]*)?)?' + // query '(?:#(.*))?' + // fragment '$');\n * The index of each URI component in the return value of goog.uri.utils.split.\n * @enum {number}\n * @var _ComponentIndex;\n (function (_ComponentIndex) {\n _ComponentIndex[_ComponentIndex["Scheme"] = 1] = "Scheme";\n _ComponentIndex[_ComponentIndex["UserInfo"] = 2] = "UserInfo";\n _ComponentIndex[_ComponentIndex["Domain"] = 3] = "Domain";\n _ComponentIndex[_ComponentIndex["Port"] = 4] = "Port";\n _ComponentIndex[_ComponentIndex["Path"] = 5] = "Path";\n _ComponentIndex[_ComponentIndex["QueryData"] = 6] = "QueryData";\n _ComponentIndex[_ComponentIndex["Fragment"] = 7] = "Fragment";\n })(_ComponentIndex || (_ComponentIndex = {}));\n * Splits a URI into its component parts.\n * Each component can be accessed via the component indices; for example:\n * <pre>\n *`

```

goog.uri.utils.split(someStr)[goog.uri.utils.ComponentIndex.QUERY_DATA];\n * </pre>\n * \n * @param
uri The URI string to examine.\n * @return Each component still URI-encoded.\n * Each component that is
present will contain the encoded value, whereas\n * components that are not present will be undefined or
empty, depending\n * on the browser's regular expression implementation. Never null, since\n * arbitrary

TypeScript has an API for JSDoc already, but it's not exposed.
https://github.com/Microsoft/TypeScript/issues/7393
For now we create types that are similar to theirs so that
migrating to their API will be easier. See e.g. `ts.JSDocTag` and `ts.JSDocComment`.

export type
 JSDocTag = {
 tagName: string;
 text?: string;
 };
Any remaining text on the tag, e.g. the description
documentation that occurs before any `@param` lines
 tagName?: undefined;
 text: string;
}

Serializes a
`Tag` into a string.
Returns a string like `@foo {bar} baz` (note the leading whitespace before `@foo`).

function tagToString(tag: JSDocTag): string {
 let out = "";
 if (tag.tagName) {
 out += `
 @${tag.tagName}`;
 }
 if (tag.text) {
 if (tag.text.match(/\\/|*|\\/|\\/)) {
 throw new Error("JSDoc text
 cannot contain `\"` and `\"*\"");
 }
 out += ' ' + tag.text.replace(/@/g, "\\@");
 }
 return
 out;
}

function serializeTags(tags: JSDocTag[]): string {
 if (tags.length === 0) return "";
 if (tags.length
 === 1 && tags[0].tagName && !tags[0].text) {
 // The JSDOC comment is a single simple tag: e.g. `/**
 @tagname */`
 return `>${tagToString(tags[0])}`;
 }
 let out = `*`;
 for (const tag of tags) {
 out += `
 *`;
 // If the tagToString is multi-line, insert ` * ` prefixes on lines.
 out += tagToString(tag).replace(/\\n/g,
 "\\n * ");
 }
 out += `
 `;
 return out;
}

https://github.com/webcomponents/webcomponentsjs/blob/4efecd7e0e/src/ShadowCSS/ShadowCSS.js\n * \n * The
original file level comment is reproduced below\n */\n\n * This is a limited shim for ShadowDOM css styling.\n
https://dvcs.w3.org/hg/webcomponents/raw-file/tip/spec/shadow/index.html#styles\n\n The intention here is to
support only the styling features which can be\n relatively simply implemented. The goal is to allow users to avoid
the\n most obvious pitfalls and do so without compromising performance significantly.\n For ShadowDOM styling
that's not covered here, a set of best practices\n can be provided that should allow users to accomplish more
complex styling.\n\n The following is a list of specific ShadowDOM styling features and a brief\n discussion of the
approach used to shim.\n\n Shimmed features:\n\n * :host, :host-context: ShadowDOM allows styling of the
shadowRoot's host\n element using the :host rule. To shim this feature, the :host styles are\n reformatted and
prefixed with a given scope name and promoted to a\n document level stylesheet.\n For example, given a scope
name of .foo, a rule like this:\n\n :host {\n background: red;\n }\n\n becomes:\n\n .foo {\n
background: red;\n }\n\n * encapsulation: Styles defined within ShadowDOM, apply only to\n dom inside the
ShadowDOM. Polymer uses one of two techniques to implement\n this feature.\n\n By default, rules are prefixed
with the host element tag name\n as a descendant selector. This ensures styling does not leak out of the 'top'\n of
the element's ShadowDOM. For example,\n\n div {\n font-weight: bold;\n }\n\n becomes:\n\n x-foo div {\n
font-weight: bold;\n }\n\n becomes:\n\n\n Alternatively, if WebComponents.ShadowCSS.strictStyling is set to

```

true then selectors are scoped by adding an attribute selector suffix to each simple selector that contains the host element tag name. Each element in the element's ShadowDOM template is also given the scope attribute. Thus, these rules match only elements that have the scope attribute. For example, given a scope name of x-foo, a rule like this:

```
div {
 font-weight: bold;
}
```

becomes:

```
div[x-foo] {
 font-weight: bold;
}
```

Note that elements that are dynamically added to a scope must have the scope selector added to them manually.

\* upper/lower bound encapsulation: Styles which are defined outside a shadowRoot should not cross the ShadowDOM boundary and should not apply inside a shadowRoot. This styling behavior is not emulated. Some possible ways to do this that were rejected due to complexity and/or performance concerns include: (1) reset every possible property for every possible selector for a given scope name; (2) re-implement css in javascript.

As an alternative, users should make sure to use selectors specific to the scope in which they are working.

\* ::distributed: This behavior is not emulated. It's often not necessary to style the contents of a specific insertion point and instead, descendants of the host element can be styled selectively. Users can also create an extra node around an insertion point and style that node's contents via descendent selectors. For example, with a shadowRoot like this:

```
<style>
 ::content(div) {
 background: red;
 }
</style>
<content></content>
```

could become:

```
<style>
 /*@polyfill .content-container div */
 ::content(div) {
 background: red;
 }
</style>
<div class="content-container">
<content></content>
</div>
```

Note the use of @polyfill in the comment above a ShadowDOM specific style declaration. This is a directive to the styling shim to use the selector in comments in lieu of the next selector when running under polyfill.

```
export class ShadowCss {
 strictStyling: boolean = true;
 constructor() {}

#L25-L32\n * In Angular Dart is converted to the 0xE500 PUA (Private Use Areas) unicode character\n *
and later on replaced by a space. We are re-implementing the same idea here.\n */\n\nexport function
replaceNgsp(value: string): string {\n // lexer is replacing the pseudo-entity with NGSP_UNICODE\n
return value.replace(new RegExp(NGSP_UNICODE, 'g'), ' ');\n}\n\n/**\n * This visitor can walk HTML parse tree
and remove / trim text nodes using the following rules:\n * - consider spaces, tabs and new lines as whitespace
characters;\n * - drop text nodes consisting of whitespace characters only;\n * - for all other text nodes replace
consecutive whitespace characters with one space;\n * - convert pseudo-entity to a single space;\n */\n
\nRemoval and trimming of whitespaces have positive performance impact (less code to generate\n * while compiling
templates, faster view creation). At the same time it can be \"destructive\"\n * in some cases (whitespaces can
influence layout). Because of the potential of breaking layout\n * this visitor is not activated by default in Angular 5
and people need to explicitly opt-in for\n * whitespace removal. The default option for whitespace removal will be
revisited in Angular 6\n * and might be changed to \"on\" by default.\n */\n\nexport class WhitespaceVisitor
