## Introduction

This document describes how to configure AireOS Wireless LAN Controllers (WLC) to synchronize date and time with a Network Time Protocol (NTP) server.

## Prerequisites

### Requirements

Ensure that you meet these requirements before you attempt this configuration:

- Basic knowledge of the configuration of Cisco WLC.
- Basic knowledge of NTP.

### Components Used

The information in this document is based on these software and hardware versions:

- Cisco WLC 3504 that runs software version 8.8.110.
- Cisco Catalyst 3560-CX Series L3 Switch that runs Cisco IOS® Software release 15.2(6)E2.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

## Manage System Date and Time on the Wireless LAN Controller

On a WLC, the system date and time can be manually configured from the WLC or configured to obtain the date and time from an NTP server.

The system date and time can be manually configured in the CLI configuration wizard or the WLC GUI/CLI.

This document provides a configuration example to synchronize the WLC system date and time through an NTP server.

NTP is a network protocol for clock synchronization between computer systems over variable-latency data networks to synchronize the clocks of computers to some time reference. The [RFC 1305](#) and [RFC 5905](#) provide detailed information on NTPv3 and NTPv4 implementation, respectively.

An NTP network usually receives its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network.

An NTP client makes a transaction with its server over the poll interval, which dynamically changes over time and depends on the network conditions between the NTP server and the client.

NTP uses the concept of a stratum to describe how many NTP hops away a machine is from an authoritative time source. For example, a stratum 1 time server has a radio or atomic clock directly attached to it. It then sends its time to a stratum 2 time server through NTP, and so forth.

For more information on the best practices for NTP deployment, refer to [Use Best Practices for Network Time Protocol](#).

The example in this document uses a Cisco Catalyst 3560-CX Series L3 Switch as an NTP server. The WLC is configured to synchronize its date and time with this NTP server.

## Configure

### Network Diagram

WLC ---- 3560-CX L3 Switch ---- NTP server

### Configurations

#### Configure the L3 Switch as an Authoritative NTP Server

Use this command in global configuration mode if you want the system to be an authoritative NTP server, even if the system is not synchronized to an outside time source:

```
#ntp master !--- Makes the system an authoritative NTP server
```

#### Configure NTP Authentication

If you want to authenticate the associations with other systems for security purposes, use the commands that are next. The first command enables the NTP authentication feature.

The second command defines each of the authentication keys. Each key has a key number, a type, and a value. Currently, the only key type supported is md5.

Third, a list of trusted authentication keys is defined. If a key is trusted, this system is ready to synchronize to a system that uses this key in its NTP packets. In order to configure NTP authentication, use these commands in global configuration mode:

```
#ntp authenticate

!--- Enables the NTP authentication feature

#ntp authentication-key number md5 value

!--- Defines the authentication keys

#ntp trusted-key key-number

!--- Defines trusted authentication keys
```

Here is an example NTP Server configuration on the 3560-CX L3 Switch. The switch is the NTP *master*, which means the router acts as the authoritative NTP server but itself gets the time from another NTP server **xxxx.xxx**.

```
(config)#ntp authentication-key 1 md5 1511021F0725 7
(config)#ntp authenticate
(config)#ntp trusted-key 1
(config)#ntp master
(config)#ntp server xxxx.xxx
```

## Configure the WLC for the NTP Server

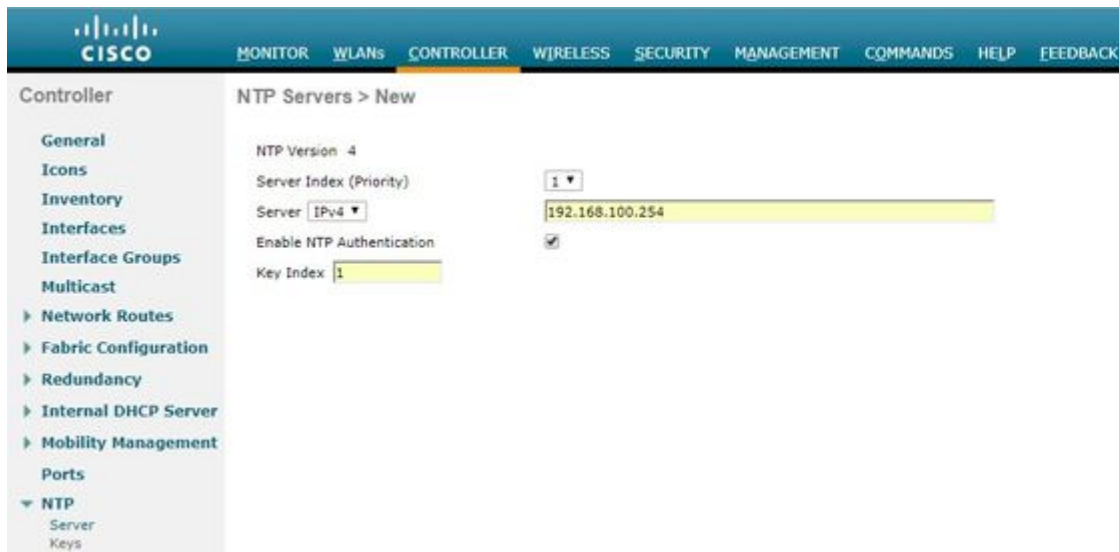

As from version 8.6 you can enable NTPv4. You can also configure an authentication channel between the controller and the NTP server.

In order to configure NTP authentication in the controller GUI, perform these steps:

1. Choose **Controller > NTP > Keys**.
2. Click **New** to create a key.
3. Enter the key index in the **Key Index** text box.
4. Choose the **Key Checksum** (MD5 or SHA1) and the **Key Format** drop-down list.
5. Enter the Key in the **Key** text box:

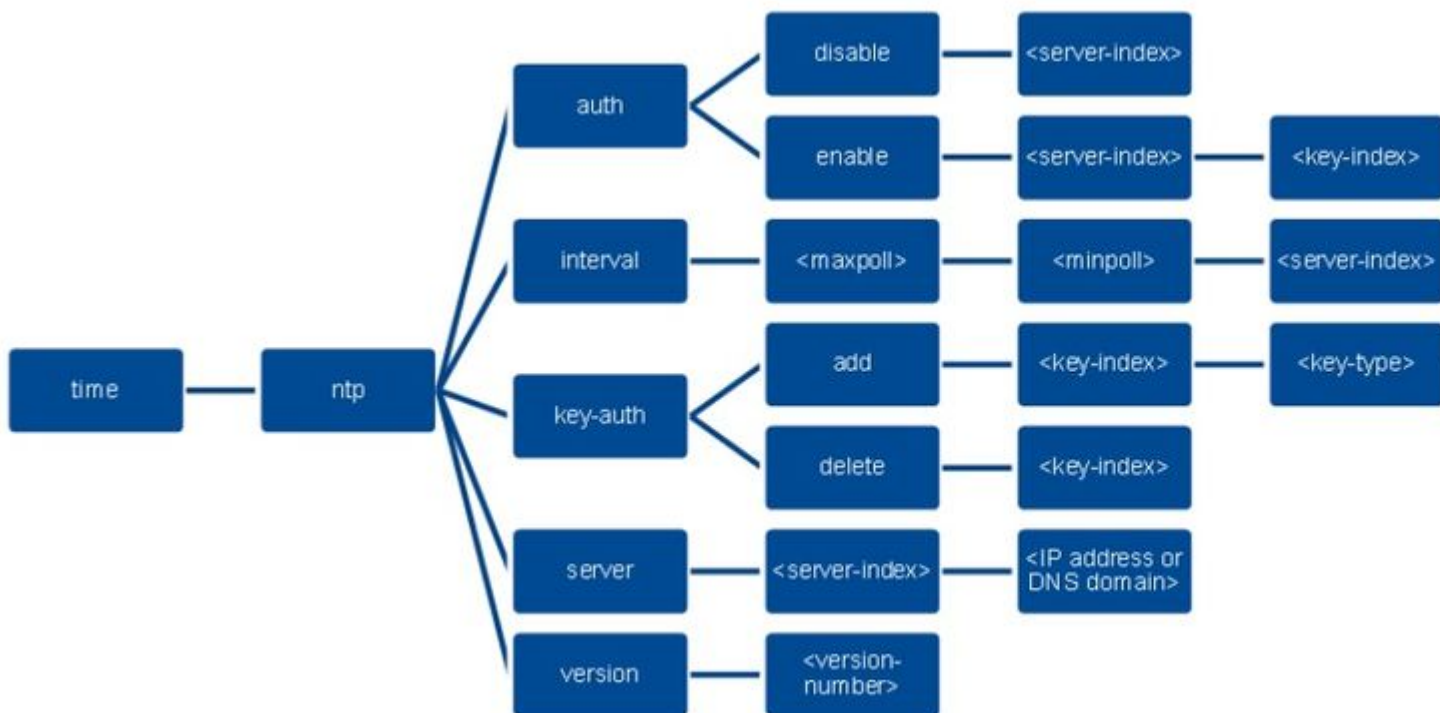

6. Choose **Controller > NTP > Servers** to open the NTP Servers page. Select version 3 or 4 and then click **New** to add an NTP server. The **NTP Servers > New** page appears.
7. Select the **Server Index (Priority)**.
8. Enter the NTP server IP Address in the **Server IP Address** text box.
9. Enable NTP server authentication, select the **NTP Server Authentication** check box and select the **Key Index** configured previously.

10. Click **Apply**.

In order to configure NTP authentication via the controller CLI, track this command tree:

```

>config time ntp version 4
>config time ntp key-auth add 1 md5 ascii cisco
>config time ntp server 1 192.168.100.254
>config time ntp auth enable 1 1
  
```

## Verify

### On the NTP Server

```
#show ntp status
```

```

Clock is synchronized, stratum 3, reference is x.x.x.x
nominal freq is 286.1023 Hz, actual freq is 286.0901 Hz, precision is 2**21
ntp uptime is 6591900 (1/100 of seconds), resolution is 3496
reference time is E007C909.80902653 (09:23:21.502 UTC Fri Feb 8 2019)
clock offset is 0.3406 msec, root delay is 59.97 msec
root dispersion is 25.98 msec, peer dispersion is 1.47 msec
loopfilter state is 'CTRL' (Normal Controlled Loop), drift is 0.000042509 s/s
system poll interval is 128, last update was 7 sec ago.
  
```

```
#show ntp associations
```

```

address ref clock st when poll reach delay offset disp
*~x.x.x.x y.y.y.y 2 20 1024 17 13.634 0.024 1.626
~127.127.1.1 .LOCL. 7 9 16 377 0.000 0.000 0.232
* sys.peer, # selected, + candidate, - outlyer, x falseticker, ~ configured
  
```

```
#show ntp information
```

```

Ntp Software Name : Cisco-ntp4
Ntp Software Version : Cisco-ntp4-1.0
Ntp Software Vendor : CISCO
  
```

Ntp System Type : Cisco IOS / APM86XXX

## On the WLC

### In the GUI

While the WLC establishes the communication:

The screenshot shows the Cisco WLC GUI with the 'CONTROLLER' tab selected. The left sidebar shows the 'NTP' menu expanded. The main content area displays 'NTP Servers' configuration with a dropdown for 'NTP Version' set to 4. Below this is a table of NTP servers:

| Server Index | Server Address(Ipv4/Ipv6) | Key Index | Key Type | Max Polling Interval | Min Polling Interval |
|--------------|---------------------------|-----------|----------|----------------------|----------------------|
| 1            | 192.168.100.254           | 1         | MD5      | 10                   | 6                    |

Below the table is the 'NTP Query Status' section, which shows a table of query results:

| ind | assid | status | conf | reach | auth | condition | last_event | cnt | src_addr        |
|-----|-------|--------|------|-------|------|-----------|------------|-----|-----------------|
| 1   | 51059 | c011   | yes  | no    | bad  | reject    | mobilize   | 1   | 192.168.100.254 |

After connection is established:

The screenshot shows the Cisco WLC GUI with the 'CONTROLLER' tab selected. The left sidebar shows the 'NTP' menu expanded. The main content area displays 'NTP Servers' configuration with a dropdown for 'NTP Version' set to 4. Below this is a table of NTP servers:

| Server Index | Server Address(Ipv4/Ipv6) | Key Index | Key Type | Max Polling Interval | Min Polling Interval |
|--------------|---------------------------|-----------|----------|----------------------|----------------------|
| 1            | 192.168.100.254           | 1         | MD5      | 10                   | 6                    |

Below the table is the 'NTP Query Status' section, which shows a table of query results:

| ind | assid | status | conf | reach | auth | condition | last_event | cnt | src_addr        |
|-----|-------|--------|------|-------|------|-----------|------------|-----|-----------------|
| 1   | 51059 | f63a   | yes  | yes   | ok   | sys.peer  | sys_peer 3 | 3   | 192.168.100.254 |

### In the WLC CLI

(Cisco Controller) >show time

Time..... Fri Feb 8 10:14:47 2019

Timezone delta..... 0:0

Timezone location.....

```

NTP Servers
  NTP Version..... 4

Index NTP Key NTP Server NTP Key Polling Intervals
Index Type Max Min
-----
1 1 192.168.100.254 MD5 10 6

```

NTPQ status list of NTP associations

```

assoc
ind assid status conf reach auth condition last_event cnt src_addr
=====
1 1385 f63a yes yes ok sys.peer sys_peer 3 192.168.100.254

```

(Cisco Controller) >

## Troubleshoot

On the NTP server side that runs Cisco IOS you can use `debug ntp all enable` command:

```

#debug ntp all
NTP events debugging is on
NTP core messages debugging is on
NTP clock adjustments debugging is on
NTP reference clocks debugging is on
NTP packets debugging is on
#
(communication between SW and NTP server xxxx.xxx)
Feb 8 09:52:30.563: NTP message sent to x.x.x.x, from interface 'Vlan1' (192.168.1.81).
Feb 8 09:52:30.577: NTP message received from x.x.x.x on interface 'Vlan1' (192.168.1.81).
Feb 8 09:52:30.577: NTP Core(DEBUG): ntp_receive: message received
Feb 8 09:52:30.577: NTP Core(DEBUG): ntp_receive: peer is 0x0D284B34, next action is 1.

(communication between SW and WLC)
Feb 8 09:53:10.421: NTP message received from 192.168.100.253 on interface 'Vlan100' (192.168.100.254).
Feb 8 09:53:10.421: NTP Core(DEBUG): ntp_receive: message received
Feb 8 09:53:10.421: NTP Core(DEBUG): ntp_receive: peer is 0x00000000, next action is 3.
Feb 8 09:53:10.421: NTP message sent to 192.168.100.253, from interface 'Vlan100' (192.168.100.254).

(communication between SW and NTP server xxxx.xxx)
Feb 8 09:53:37.566: NTP message sent to x.x.x.x, from interface 'Vlan1' (192.168.1.81).
Feb 8 09:53:37.580: NTP message received from x.x.x.x on interface 'Vlan1' (192.168.1.81).
Feb 8 09:53:37.580: NTP Core(DEBUG): ntp_receive: message received
Feb 8 09:53:37.580: NTP Core(DEBUG): ntp_receive: peer is 0x0D284B34, next action is 1.

(communication between SW and WLC)
Feb 8 09:54:17.421: NTP message received from 192.168.100.253 on interface 'Vlan100' (192.168.100.254).
Feb 8 09:54:17.421: NTP Core(DEBUG): ntp_receive: message received
Feb 8 09:54:17.421: NTP Core(DEBUG): ntp_receive: peer is 0x00000000, next action is 3.
Feb 8 09:54:17.421: NTP message sent to 192.168.100.253, from interface 'Vlan100' (192.168.100.254).

```

On WLC side:

>debug ntp ?

detail Configures debug of detailed NTP messages.  
low Configures debug of NTP messages.  
packet Configures debug of NTP packets.

(at the time of write this doc there was Cisco bug ID [CSCvo29660](#)  
on which the debugs of ntpv4 are not printed in the CLI. The below debugs are using NTPv3.)

(Cisco Controller) >debug ntp detail enable
