# SIP Binding

The SIP Binding feature enables you to configure a source IP address for signaling packets and media packets.

## Feature Information for SIP Binding

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to https://cfnng.cisco.com/. An account on Cisco.com is not required.

**Table 1: Feature Information for SIP Binding**

| Feature Name | Releases | Feature Information |
|---|---|---|
| SIP Gateway Support for the bind Command | Cisco IOS 12.2(2)XB, 12.2(2)XB2, 12.2(8)T, 12.2(11)T, and 12.3(4)T<br><br>Cisco IOS XE 3.1.0S | The SIP Gateway Support for the **bind** Command feature allows you to configure the source IP address of signaling packets and media packets.<br><br>In 12.2(2)XB, this feature was introduced.<br><br>In 12.3(4)T, this feature was expanded to provide the flexibility to specify different source interfaces for signaling and media, and allow network administrators a finer granularity of control on the network interfaces used for voice traffic.<br><br>The following commands were introduced or modified: **bind**, **show dial-peer voice**, **show ip sockets**, **show sip-ua connections**, and **show sip-ua status**. |

| Feature Name | Releases | Feature Information |
|---|---|---|
| Support for Ability to Configure Source IP Address for Signaling and Media per SIP Trunk | 15.1(2)T | This feature allows you to configure a separate source IP address per SIP trunk. This source IP address is embedded in all SIP signaling and media packets that traverse the SIP trunk. This feature enables service providers for better profiling and billing policies. It also enables greater security for enterprises by the use of distinct IP addresses within and outside the enterprise domain.<br><br>The following command was introduced or modified: **voice-class sip bind**. |
| Support of Live Binding at dial-peers. | Cisco IOS XE Amsterdam 17.3.1a | This feature allows you to either change or add binding on a dial-peer that does not have any active calls, while other dial-peers with the same binding has active calls.<br><br>The following command was introduced or modified: **voice-class sip bind all**. |

# Information About SIP Binding

When you configure SIP on a router, the ports on all its interfaces are open by default. This makes the router vulnerable to malicious attackers who can execute toll fraud across the gateway if the router has a public IP address and a public switched telephone network (PSTN) connection. To eliminate the threat, you should bind an interface to an IP address so that only those ports are open to the outside world. In addition, you should protect any public or untrusted interface by configuring a firewall or an access control list (ACL) to prevent unwanted traffic from traversing the router.

**Note** All CUBE Enterprise deployments must have signaling and media bind statements specified at the dial-peer or voice class tenant level. For voice call tenants, you must apply tenants to dial-peers used for CUBE call flows if these dial-peers do not have bind statements specified.

# Benefits of SIP Binding

- SIP signaling and media paths can advertise the same source IP address on the gateway for certain applications, even if the paths used different addresses to reach the source. This eliminates confusion for firewall applications that may have taken action on source address packets before the use of binding.

- Firewalls filter messages based on variables such as the message source, the target address, and available ports. Normally a firewall opens only certain addresses or port combination to the outside world and those addresses can change dynamically. Because VoIP technology requires the use of more than one address or port combination, the **bind** command adds flexibility by assigning a gateway to a specific interface (and therefore the associated address) for the signaling or media application.

- You can obtain a predefined and separate interface for both signaling and media traffic. After a **bind** command is in effect, the interface it limits is bound solely to that purpose. Administrators can therefore

dictate the use of one network to transport the signaling and another network to transport the media. The benefits of administrator control are:

- Administrators know the traffic that runs on specific networks, thereby making debugging easier.
- Administrators know the capacity of the network and the target traffic, thereby making engineering and planning easier.
- Traffic is controlled, allowing Qualtiy of Service (QoS) to be monitored.

- The **bind media** command relaxes the constraints imposed by the **bind control** and **bind all** commands, which cannot be set during an active call. The **bind media** command works with active calls.

# Source Address

In early releases of Cisco IOS software with SIP functionality, the source address of a packet going out of the gateway was never deterministic. That is, the session protocols and VoIP layers always depended on the IP layer to give the *best local address* . The best local address was then used as the source address (the address showing where the SIP request came from) for signaling and media packets. Using this non-deterministic address occasionally caused confusion for firewall applications, because a firewall could not be configured with an exact address and would take action on several different source address packets.

However, the **bind** command enables you to configure the source IP address of signaling and media packets to a specific interface's IP address. Thus, the address that goes out on the packet is bound to the IP address of the interface specified with the **bind** command. Packets that are not destined to the bound address are discarded.

When you do not want to specify a bind address or if the interface is down, the IP layer still provides the best local address.

The Support Ability to Configure Source IP Address for Signaling and Media per SIP Trunk feature extends the global bind functionality to support the SIP signaling Transport Layer Socket (TLS) with UDP and TCP. The source address at the dial peer is the source address in all the signaling and media packets between the gateway and the remote SIP entity for calls using the dial-peer. Multiple SIP listen sockets with specific source address handle the incoming SIP traffic from each selected SIP entity. The order of preference for retrieving the SIP signalling and media source address for inbound and outbound calls is as follows:

- Bind configuration at dial peer level

- Bind configuration at global level

- Best local IP address to reach the destination

The table below describes the state of the system when the **bind** command is applied in the global or dial peer level:

*Table 2: State of the System for the bind Address*

| Bind State | System Status |
|---|---|
| No global bind | The best local address is used in all outbound SIP messages. Only one SIP listen socket with a wildcard source address. |
| Global bind | Global bind address used in all outbound SIP messages. Only one SIP listen socket with global bind address. |

| Bind State | System Status |
|---|---|
| No global bind<br><br>Dial peer bind | Dial peer bind address is used in outbound SIP messages of this dial peer. The remaining SIP messages use the best local address.<br><br>One SIP listen socket with a wildcard source address.<br><br>Additional SIP listen socket for each different dial peer bind listening on the specific dial peer bind address. |
| Global bind<br><br>Dial peer bind | Dial peer bind address is used in outbound SIP messages of this dial peer. The remaining SIP messages use the global bind address.<br><br>One SIP listen socket with global bind address.<br><br>Additional SIP listen socket for each different dial peer bind command listening on the specific dial peer bind address. |

The **bind** command performs different functions based on the state of the interface (see the table below).

*Table 3: State of the Interface for the bind Command*

| Interface State | Result Using Bind Command |
|---|---|
| Shut down<br><br>With or without active calls | TCP, TLS, and User Datagram Protocol (UDP) socket listeners are initially closed. (Socket listeners receive datagrams addressed to the socket.)<br><br>Then the sockets are opened to listen to any IP address.<br><br>If the outgoing gateway has the **bind** command enabled and has an active call, the call becomes a one-way call with media flowing from the outgoing gateway to the terminating gateway.<br><br>The dial peer bind socket listeners of the interface are closed and the configuration turns inactive for all subsequent SIP messages. |
| No shut down<br><br>No active calls | TCP, TLS, and UDP socket listeners are initially closed. (Socket listeners receive datagrams addressed to the socket.)<br><br>Then the sockets are opened and bound to the IP address set by the **bind** command.<br><br>The sockets accept packets destined for the bound address only.<br><br>The dial peer bind socket listeners of the interface are reopened and the configuration turns active for all subsequent SIP messages. |
| No shut down<br><br>Active calls | TCP, TLS, and UDP socket listeners are initially closed.<br><br>Then the sockets are opened to listen to any IP address.<br><br>The dial peer bind socket listeners of the interface are reopened and the configuration turns active for all subsequent SIP messages. |

| Interface State | Result Using Bind Command |
|---|---|
| Bound-interface IP address is removed. | TCP, TLS, and UDP socket listeners are initially closed.<br><br>Then the sockets are opened to listen to any address, because the IP address has been removed. This happens even when SIP was never bound to an IP address.<br><br>A message stating that the IP address has been deleted from the SIP bound interface is printed.<br><br>If the outgoing gateway has the **bind** command enabled and has an active call, the call becomes a one-way call with media flowing from the outgoing gateway to the terminating gateway.<br><br>The dial peer bind socket listeners of the interface are closed and the configuration turns inactive for all subsequent SIP messages. |
| The physical cable is pulled on the bound port or the interface layer is down. | TCP, TLS, and UDP socket listeners are initially closed.<br><br>Then the sockets are opened and bound to listen to any address.<br><br>When the pulled cable is replaced, the result is as documented for **no shutdown** interfaces.<br><br>The dial peer bind socket listeners of the interface are closed and the configuration turns inactive for all subsequent SIP messages. |
| A bind interface is shut down or its IP address is changed or the physical cable is pulled while SIP calls are active. | The call becomes a one-way call with media flowing in only one direction. It flows from the gateway where the change or shutdown took place, to the gateway where no change occurred. Thus, the gateway with the status change no longer receives media.<br><br>The call is then disconnected, but the disconnected message is not understood by the gateway with the status change, and the call is still assumed to be active.<br><br>If the bind interface is shutdown, the dial peer bind socket listeners of the interface are closed. If the IP address of the interface is changed, the socket listeners representing the bind command is opened with the available IP address of the interface and the configuration turns active for all subsequent SIP messages. |

**Note**   If there are active calls, the **bind** command does not take effect if it is issued for the first time or if another **bind** command is in effect. A message reminds you that there are active calls and that the change cannot take effect.

The **bind** command applied at the dial peer level can be modified only in the following situations:

- Dial peer bind can be modified when the dial-peer do not have any active calls.

- Dial peer bind is disabled in the supported IOS configuration options.

- Dial peer bind is removed when the bound interface is removed.

- Dial peer bind is removed when the dial peer is removed.

# Voice Media Stream Processing

The SIP Gateway Support Enhancements to the bind Command feature extends the capabilities of the **bind** command by supporting a deterministic network interface for the voice media stream. Before the voice media stream addition, the **bind** command supported a deterministic network interface for control (signaling) traffic or all traffic. With the SIP Gateway Support Enhancements to the bind Command feature, a finer granularity of control is achieved on the network interfaces used for voice traffic.

If multiple **bind** commands are issued in sequence—that is, if one **bind** command is configured and then another **bind** command is configured—a set interaction happens between the commands. The table below describes the expected command behavior.

*Table 4: Interaction Between Previously Set and New bind Commands*

| Interface State | bind Command | Result Using bind Command |
|---|---|---|
| Without active calls | **bind all** | Generated **bind control** and **bind media** commands to override existing **bind control** and **bind media** commands. |
| | **bind control** | Overrides existing **bind control** command. |
| | **bind media** | Overrides existing **bind media** command. |
| With active calls | **bind all** or **bind control** **bind media** | Global Configuration:<br><br>Blocks the command, and the following error message appears:<br><br>• Error: You cannot change the interface binding for a dial-peer that is processing live traffic. |
| | **bind all** or **bind control** or **bind media** | Dial-peer Configuration:<br><br>You cannot apply **bind** or **no bind** command to a dial-peer that is processing active calls.<br><br>Blocks the command, and the following error message appears:<br><br>• Error: You cannot change the interface binding for a dial-peer that is processing live traffic. |

Consider the following scenarios for attaching a tenant to a dial-peer that is processing active calls:

- You can attach a tenant to a dial-peer, when the the dial-peer has **bind** (**bind control** or **bind all** ) command enabled.

- You cannot attach a tenant to a dial-peer, when the dial-peer has **no bind** or **bind media** command enabled and the tenant has **bind control** or **bind all** command enabled.

Consider the following scenarios for changing bind configuration on a tenant, when the tentant is attached to a dial-peer that is processing active calls:

- You can change the bind configuration on tenant, when the associated dial-peer has **bind** ( **bind control** or **bind all** ) command enabled. Because, the dial-peer bind configuration takes precedence over the tenant bind configuraiton.

- You cannot change the bind configuration on tenant, when the associated dial-peer has **no bind** or **bind media** command enabled and the tenant has **bind control** or **bind all** command enabled.

The **bind all** and **bind control** commands perform different functions based on the state of the interface.

**Note** The **bind all** command applies to global and dial peer. The table below applies to **bind media** only if the media interface is the same as the **bind control** interface. If the two interfaces are different, media behavior is independent of the interface state.

*Table 5: bind all and bind control Functions, Based on Interface State*

| Interface State | Result Using bind all or bind control Commands |
|---|---|
| Shut down<br>With or without active calls | TCP, TLS, and UDP socket listeners are initially closed. (Socket listeners receive datagrams addressed to the socket.)<br>Then the sockets are opened to listen to any IP address.<br>If the outgoing gateway has the **bind** command enabled and has an active call, the call becomes a one-way call with media flowing from the outgoing gateway to the terminating gateway.<br>The dial peer bind socket listeners of the interface are closed and the configuration turns inactive for all subsequent SIP messages. |
| Not shut down<br>Without active calls | TCP, TLS, and UDP socket listeners are initially closed. (Socket listeners receive datagrams addressed to the socket.)<br>Then the sockets are opened and bound to the IP address set by the **bind** command.<br>The sockets accept packets destined for the bound address only.<br>The dial peer bind socket listeners of the interface are reopened and the configuration turns active for all subsequent SIP messages. |
| Not shut down<br>With active calls | TCP, TLS, and UDP socket listeners are initially closed.<br>Then the sockets are opened to listen to any IP address.<br>The dial peer bind socket listeners of the interface are reopened and the configuration turns active for all subsequent SIP messages. |

| Interface State | Result Using bind all or bind control Commands |
|---|---|
| Bound interface's IP address is removed. | TCP, TLS, and UDP socket listeners are initially closed.<br><br>Then the sockets are opened to listen to any address because the IP address has been removed.<br><br>A message is printed that states the IP address has been deleted from the bound SIP interface.<br><br>If the outgoing gateway has the **bind** command enabled and has an active call, the call becomes a one-way call with media flowing from the outgoing gateway to the terminating gateway.<br><br>The dial peer bind socket listeners of the interface are closed and the configuration turns inactive for all subsequent SIP messages. |
| The physical cable is pulled on the bound port, or the interface layer goes down. | TCP, TLS, and UDP socket listeners are initially closed.<br><br>Then the sockets are opened and bound to listen to any address.<br><br>When the pulled cable is replaced, the result is as documented for interfaces that are not shut down.<br><br>The dial peer bind socket listeners of the interface are closed and the configuration turns inactive for all subsequent SIP messages. |
| A bind interface is shut down, or its IP address is changed, or the physical cable is pulled while SIP calls are active. | The call becomes a one-way call with media flowing in only one direction. The media flows from the gateway where the change or shutdown took place to the gateway where no change occurred. Thus, the gateway with the status change no longer receives media.<br><br>The call is then disconnected, but the disconnected message is not understood by the gateway with the status change, and the call is still assumed to be active.<br><br>If the bind interface is shutdown, the dial peer bind socket listeners of the interface are closed. If the IP address of the interface is changed, the socket listeners representing the bind command is opened with the available IP address of the interface and the configuration turns active for all subsequent SIP messages. |

# Configuring SIP Binding

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip address** *ip-addressmask* [**secondary**]
5. **exit**
6. Use one of the following commands to configure SIP binding:

   • **bind** {**control** | **all**} **source-interface** *interface-id* [**ipv6-address** *ipv6-address*] in SIP configuration mode.

- **bind media** {**source-address ipv4** *ipv4-address* | **source-interface** *interface-id* [**ipv6-address** *ipv6-address*]} in SIP configuration mode.
- **voice-class sip bind media** {**source-address ipv4** *ipv4-address* | **source-interface** *interface-id* [**ipv6-address** *ipv6-address*]} in dial-peer configuration mode.

7. **end**

## DETAILED STEPS

| | Command or Action | Purpose |
|---|---|---|
| **Step 1** | **enable**<br><br>**Example:**<br><br>`Router> enable` | Enables privileged EXEC mode.<br><br>• Enter your password if prompted. |
| **Step 2** | **configure terminal**<br><br>**Example:**<br><br>`Router# configure terminal` | Enters global configuration mode. |
| **Step 3** | **interface** *type number*<br><br>**Example:**<br><br>`Router(config)# interface fastethernet0/0` | Configures an interface type and enters the interface configuration mode.<br><br>• *type number* —Type of interface to be configured and the port, connector, or interface card number. |
| **Step 4** | **ip address** *ip-addressmask* [**secondary**]<br><br>**Example:**<br><br>`Router(config-if)# ip address 192.168.200.33 255.255.255.0` | Configures a primary or secondary IP address for an interface.<br><br>**Note** Secondary IP address on an interface with SIP binding is not supported for CUBE. |
| **Step 5** | **exit**<br><br>**Example:**<br><br>`Router(config-if)# exit` | Exits the current mode. |
| **Step 6** | Use one of the following commands to configure SIP binding:<br><br>• **bind** {**control** | **all**} **source-interface** *interface-id* [**ipv6-address** *ipv6-address*] in SIP configuration mode.<br>• **bind media** {**source-address ipv4** *ipv4-address* | **source-interface** *interface-id* [**ipv6-address** *ipv6-address*]} in SIP configuration mode.<br>• **voice-class sip bind media** {**source-address ipv4** *ipv4-address* | **source-interface** *interface-id* [**ipv6-address** *ipv6-address*]} in dial-peer configuration mode. | Sets a source interface for signaling and media packets. The binding applies to the specified interfaces only. SIP must be configured globally or at a dial peer level.<br><br>• **control** —Binds signaling packets.<br><br>• **media** —Binds media packets.<br><br>• **all** —Binds signaling and media packets.<br><br>• **source-address**—Binds media packets directly to an IP address.<br><br>• **ipv4** *ipv4-address*—Configures the IPv4 address. |

| | Command or Action | Purpose |
|---|---|---|
| | **Example:**<br>SIP binding in SIP configuration mode:<br><br>```Device(config)# voice service voip\nDevice(conf-voi-serv)# sip\nDevice(conf-serv-sip)# bind control\nsource-interface FastEthernet0/0\nDevice(conf-serv-sip)# exit\n\nDevice(config)# voice service voip\nDevice(conf-voi-serv)# sip\nDevice(conf-serv-sip)# bind media source-address\nipv4 172.18.192.204\nDevice(conf-serv-sip)# exit```<br><br>**Example:**<br>SIP binding in dial-peer configuration mode:<br><br>```Device(config)# dial-peer voice 100 voip\nDevice(config-dial-peer)# session protocol sipv2\nDevice(config-dial-peer)# voice-class sip bind\ncontrol source-interface fastethernet0/0\nDevice(config-dial-peer)# exit\n\nDevice(config)# dial-peer voice 100 voip\nDevice(config-dial-peer)# session protocol sipv2\nDevice(config-dial-peer)# voice-class sip bind\nmedia source-address ipv4 172.18.192.204\nDevice(config-dial-peer)# exit``` | • **source interface** *interface-id* —Type of interface and its ID.<br><br>• **ipv6-address** *ipv6-address* —Configures the IPv6 address. Ensure that the IPv6 address has been applied to an interface. |
| **Step 7** | **end** | Exits to privileged EXEC mode. |

# Verifying SIP Binding

**SUMMARY STEPS**

1. **show ip sockets**
2. **show sip-ua status**
3. **show sip-ua connections** {**tcp** [**tls**] | **udp**} {**brief** | **detail**}
4. **show dial-peer voice**
5. **show running-config**

**DETAILED STEPS**

**Step 1**   **show ip sockets**

Use this command to display IP socket information and indicate whether the bind address of the receiving gateway is set.

The following sample output indicates that the bind address of the receiving gateway is set:

**Example:**

```
Device# show ip sockets

Proto Remote Port Local Port In Out Stat TTY OutputIF
17 0.0.0.0 0--any-- 2517 0 0 9 0
17 --listen-- 172.18.192.204 1698 0 0 1 0
17 0.0.0.0 0 172.18.192.204 67 0 0 489 0
17 0.0.0.0 0 172.18.192.204 5060 0 0 A1 0
```

**Example:**

**Step 2**     **show sip-ua status**

Use this command to display SIP user-agent status and indicate whether bind is enabled.

The following sample output indicates that signaling is disabled and media on 172.18.192.204 is enabled:

**Example:**

```
Device# show sip-ua status
SIP User Agent Status
SIP User Agent for UDP : ENABLED
SIP User Agent for TCP : ENABLED
SIP User Agent for TLS over TCP : ENABLED
SIP User Agent bind status(signaling): DISABLED
SIP User Agent bind status(media): ENABLED 172.18.192.204
SIP early-media for 180 responses with SDP: ENABLED
SIP max-forwards : 70
SIP DNS SRV version: 2 (rfc 2782)
NAT Settings for the SIP-UA
Role in SDP: NONE
Check media source packets: DISABLED
Maximum duration for a telephone-event in NOTIFYs: 2000 ms
SIP support for ISDN SUSPEND/RESUME: ENABLED
Redirection (3xx) message handling: ENABLED
Reason Header will override Response/Request Codes: DISABLED
Out-of-dialog Refer: DISABLED
Presence support is DISABLED
protocol mode is ipv4
SDP application configuration:
 Version line (v=) required
Owner line (o=) required
 Timespec line (t=) required
 Media supported: audio video image
 Network types supported: IN
 Address types supported: IP4 IP6
 Transport types supported: RTP/AVP udptl
```

**Step 3**     **show sip-ua connections {tcp [tls] | udp} {brief | detail}**

Use this command to display the connection details for the UDP transport protocol. The command output looks identical for TCP and TLS.

**Example:**

```
Device# show sip-ua connections udp detail

Total active connections      : 0
No. of send failures          : 0
No. of remote closures        : 0
No. of conn. failures         : 0
No. of inactive conn. ageouts : 10
```

```
---------Printing Detailed Connection Report---------
Note:
 ** Tuples with no matching socket entry
    - Do 'clear sip <tcp[tls]/udp> conn t ipv4:<addr>:<port>'
      to overcome this error condition
 ++ Tuples with mismatched address/port entry
    - Do 'clear sip <tcp[tls]/udp> conn t ipv4:<addr>:<port> id <connid>'
      to overcome this error condition
 No Active Connections Found
-------------- SIP Transport Layer Listen Sockets ---------------
  Conn-Id            Local-Address
 ===========    =============================
    2              [9.42.28.29]:5060
```

**Step 4**     **show dial-peer voice**

Use this command, for each dial peer configured, to verify that the dial-peer configuration is correct. The following is sample output from this command for a VoIP dial peer:

**Example:**

```
Device# show dial-peer voice 101

VoiceOverIpPeer1234
        peer type = voice, system default peer = FALSE, information type = voice,
        description = `',

          Last Disconnect Time = 0.
```

**Note**    If the bind address is not configured at the dial-peer, the output of the **show dial-peer voice** command remains the same except for the values of the **voice class sip bind control** and **voice class sip bind media**, which display "system," indicating that the bind is configured at the global level.

**Step 5**    **show running-config**

Although the bind all command is an accepted configuration, it does not appear in **show running-config** command output. Because the **bind all** command is equivalent to issuing the commands **bind control** and **bind media**, those are the commands that appear in the **show running-config** command output.

**Example:**

The following sample output shows that bind is enabled on router 172.18.192.204:

```
